Preface

This documentation describes how to test business services, subprograms, subroutines, and maps in the NaturalONE environment. It is organized under the following headings:

Release Notes	Information on new features and enhancements.
Prerequisites	Prerequisites for application testing.
Getting Started	A brief introduction to application testing. How to test a simple subprogram, how to save it as a unit test file, and how to generate an Ant script from the unit test file.
Features of the Test Editors	Describes the features of the test editors for business services and subprogram, such as navigation options and toolbar icons.
Test a Business Service or Subprogram Directly	How to run a business service or subprogram by analyzing the parameters in a test editor.
Create a Unit Test for a Business Service or Subprogram	How to create a Natural unit test for a business service or subprogram.
Create an External Data Unit Test	How to create a unit test that accepts input and/or validations from a CSV file.
Create a Sequence Unit Test	How to create a special type of unit test that executes a sequence of test steps in a specified order.
Test an External Subroutine	How to test an external subroutine using either a subprogram or a program that calls a subprogram.
Test a Natural Map	How to test a map as you would on the server.
Setting Preferences for Application Testing	Describes the preferences you can set for the test functions, such as setting preferences for logging unit test results and synchronizing local resources with those on the server.

Creating Ant Scripts to Run Unit Tests How to create XML-based Ant scripts to run unit test files.

1 Release Notes

What's New in Version 8.3.1	
What's New in Version 8.3.2	
What's New in Version 8.3.3	2
What's New in Version 8.3.4	2
 What's New in Version 8.3.5 	

These *Release Notes* pertain to the Application Testing component of NaturalONE version 8.3.

What's New in Version 8.3.1

Debug Subprograms via RPC

You can now use the NaturalONE debug attach server to debug a subprogram in the **Test Subprogram** editor. For information, see *Debug a Subprogram Directly*.

What's New in Version 8.3.2

New Connection Parameters in the testsuite Ant Task to Define RPC Credentials

New connection parameters have been added to the testsuite Ant task to define an RPC user ID and password for secured Natural environments. For information, see *Parameters Specified as Nested Elements*.

What's New in Version 8.3.3

New Parameters in the testsuite Ant Task to Handle Unit Test Failures

New parameters have been added to the testsuite Ant task that will help control the behavior of the Ant script upon unit test failures. For information, see *Parameters*.

What's New in Version 8.3.4

New Connection Parameter to Define that only the RPC Server is to be Used

The new option **Set project steplibs** has been added to the tab which defines the environment in which the test is to be run. It is used to indicate whether the steplibs from the Natural project are set in the RPC server environment. If checked (default), the Natural Development Server is used. If not checked, only the RPC server environment is used, without Natural Development Server. See *Define Connections*.

In addition, the new parameter setProjectSteplibs has been added to the testsuite Ant Task. See *Parameters*.

In order to be compatible with previous versions, the Natural Development Server is used by default.

What's New in Version 8.3.5

New Style Sheet

A new style sheet, *natural_mapeditor.css*, is available. If you would like to see the same colors in the output window as in the map editor, you can use this new style sheet instead of the default style sheet *natural.css*. See also *Test a Natural Map*.

2 Prerequisites

When the Application Testing component of NaturalONE has been installed, you can use the test functions supplied with NaturalONE. If this component has not yet been installed, use the Software AG Installer to install it.

The tests are run using the EntireX RPC mechanism. While many details are hidden, you must have some knowledge of EntireX RPC to run the tests.

To test subprograms and business services directly, and to create unit tests for subprograms and business services, a Natural RPC server is required. The Natural Development Server cannot be used in this context. If you are testing items in a project connected to the local Natural runtime environment, a special connection via RPC must be made.

As a business service cannot be tested in the local Natural runtime environment without a full local installation of Natural Business Services, the tests are simulated locally by calling the subprogram directly.

Getting Started

• (General Information	8
•]	Festing a Subprogram Directly	. 9
• (Creating a Unit Test	11
• F	Running a Unit Test	14
• (Generating an Ant Script	15

General Information

This is a brief introduction to working with the Application Testing component of NaturalONE. It explains how to test a simple subprogram, how to save it as a unit test file, and how to generate an Ant script from the unit test file. You can then use the Ant script, for example, with your automated nightly tests. It is assumed that you use the local RPC server which is automatically started when you start NaturalONE.

Note: Testing business services is not in the scope of this introduction. However, this works similarly.

The topics below assume that you have created a Natural project which uses the local Natural runtime. This Natural project contains a library with two objects, a subprogram and a parameter data area (PDA).

Testing is illustrated using the following simple subprogram:

```
DEFINE DATA PARAMETER
USING PDA1
END-DEFINE
#result := #var1 + #var2
END
```

where the subprogram calls the following PDA:

```
DEFINE DATA PARAMETER
1 #var1 (I4)
1 #var2 (I4)
1 #result (I4)
END-DEFINE
```

Do not forget to build your Natural project before you start testing.

Testing a Subprogram Directly

When you test a subprogram directly, you can analyze the parameters in a test editor. You can change the input values, run the test, and verify the return values.

> To test a subprogram

- 1 In the **Navigator** view, select the subprogram.
- 2 Invoke the context menu and choose **Testing > Test Subprogram**.

The test editor appears.

🔒 SUB1 🕱			
Test Subprogram		🎋 - 🗛 - 🔳 🕅	- 2123]0
Data			
#var1 -> 0 #var2 -> 0 #result -> 0	Property	Value	
Data Connection			

3 Select the entry for #var1 on the left side of the test editor.

Properties are now shown on the right side of the test editor.

4 Define a value for #var1 on the right side. Example:

🔂 SUB1 🕱		- 8
Test Subprogram	🎋 - Q	• 🔳 🔀 • 🖻 🖬 🍯 💿
Data		
#var1 -> 3	Property	Value
#var2 -> 0	⊿ Misc	
#result -> 0	IDL	#var1 (I4) InOut
	Name	#var1
	⊿ Value	
	Value	3
L		· · · · · · · · · · · · · · · · · · ·
Data Connection		

- 5 Select the entry for #var2 on the left side of the test editor, and define a value on the right side.
- ⁶ Choose the $\$ (Run Test) button in the local toolbar of the test editor.

The result value is now shown. Example:

Creating a Unit Test

After defining the input and output parameters for the test, you can save this as a unit test.

> To create a unit test

- 1 Make sure that the editor with your previous test is active.
- 2 From the **File** menu, choose **Save As**.

The New Natural Unit Test dialog appears.

New Natura	I Unit Test	
Define Natu Enter the setti	ral Unit Test Details ngs for a new Natural unit test.	N
Target		
Project:	MyTestProject	Browse
Parent suite:		(default) Browse
Test name:	SUB1	
	(/Testing-Suites/SUB1.nattst) Generate default Construct tests Ø Display generated file(s)	
Natural subp	rogram	
File name:	MyTestProject/Natural-Libraries/MYTEST/SRC/SUB1.NSN	Browse
?	< Back Next > Finish	Cancel

The name of the subprogram is automatically provided as the name for the unit test. For now, you need not change any information.

3 Choose the **Finish** button.

A folder named **Testing-Suites** is automatically created in the project. This folder is always created when you create the first unit test in a project.

The unit test is stored in the new **Testing-Suites** folder. Unit tests for subprograms (also called "Natural unit tests)" have the extension *.nattst*.

The generated unit test file is automatically shown in the unit test editor (provided that you have not deselected the **Display generated file(s)** in the **New Natural Unit Test** dialog).

🖟 SUB1 🛛 🔒 SUB1.nattst 🛛	- 8
Summary	9. E 🤉
▼ Natural	
Library: MYTEST Subprogram: SUB1	
▼ Connection	
Broker ID: localhost:1971 Server: RPC/NATSRV2800/CALLNAT	
▼ Input	
#var1 -> 3 #result -> 8 #var2 -> 5	
▼ Validation	
▼ Error	
Expect error	
Error class:	
Error code:	
Message:	Regex
Summary Connection Input Validation	

The **Summary** tab shows the information that will be used for the test.

You can save the test for later reuse. For example, you can use it as the basis for an Ant script. Before you save the test, however, you have the possibility the change information on the following tabs: Summary

You can allow a test to pass with an expected error.

Connection

You can define a different RPC environment for your test.

Input

You can change the input fields that are to be sent to the server.

Validation

You can configure the fields that are to be tested after the call to the server has been made.

Detailed information these tabs is provided later in this documentation.

4 Use the standard Eclipse functionality to save your changes. For example, press CTRL+S.

Running a Unit Test

After you have created the unit test, you can run it in order to check whether it works as expected.

> To run a unit test

Choose the Solution in the local toolbar of the unit test editor.

Or:

In the **Navigator** view, select the file with the extension *.nattst,* invoke the context menu and choose **Testing > Run Unit Test(s)**.

The Natural Unit Test view is automatically opened the first time you run a unit test. Example:

🔲 Properties 🌇 Natural Unit Test 🕴	o. 🖓 🖓 🖫 🖛 ▾ 🗖 E	3
Tests	Summary	
SUB1.nattst (0,031s)	Test:SUB1.nattst RPC connection: local Natural runtime (Broker ID: localhost:1971) State: passed Elapsed time: 0,031s	*
	٠	

When the test was successful, the state "passed" is shown.

Generating an Ant Script

You can generate XML-based Ant scripts which run your unit test files.

> To generate an Ant script

- 1 In the **Navigator** view, select the unit test file you have previously created (that is, the file with the extension *.nattst*).
- 2 Invoke the context menu and choose **New > Other**.
- 3 In the resulting dialog box, expand **Software AG > Testing** and then choose **Natural Unit Test Ant Script**.

The following dialog appears.

New Natural Unit Te	est Ant Script	- • •
Ant information Enter in details to crea	ate an Ant script for Natural unit test(s)	N
Eclipse root:	P:/SoftwareAG/NaturalONE83/Designer/eclipse/	Browse
Workspace root:	D:/Users/natural/workspace	Browse
Output container:	/MyTestProject/Testing-Suites	Browse
Broker connection ID:	Natural RPC Server 👻	
Generate .cmd file:		
2	C Back Next > Finish	Cancel
		Cancer

For now, leave the provided settings as they are.

4 Choose the **Finish** button.

The following files are created in the **Testing-Suites** folder:

build.xml

This file contains the Ant script. It is automatically opened in the Ant editor, and you can now refine the Ant parameters as desired. Detailed information on these parameters is provided later in this documentation.

■ run.cmd

This file contains the DOS commands for running the script. You run this file outside of Eclipse via the command line.

4 Features of the Test Editors

This section describes the features of the test editors, such as navigation options and toolbar icons. The following example shows the **Test Subprogram** editor. The test editors are similar for both business services and subprograms; the main differences between the editors are that the Debug option is not available in the **Test Business Service** editor and you can select the method to test (which can change which subprogram is tested internally).

In this example, the INPUT-DATA and OUTPUT-DATA fields have been expanded:

CALC X			
Test Subprogram		🎄 - Q, - 🔳 🔀 - 🖄 🖆	0
Data			
<pre>INPUT-DATA #FUNCTION -> #FIRST-NUM -> 0.00 #SECOND-NUM -> 0.00 #SUCCESS-CRITERIA -> 0 OUTPUT-DATA #RESULT -> 0.00 #TIME #SUCCESS -> false</pre>	Property	Value	
Data Connection			

Keyboard navigation is supported in all editors. In the example above, you can use keys on the keyboard to move from one field to another in the tree view and/or navigate to the table on the right to add or edit values.

The following table describes each of the options available on the editor toolbar:

Toolbar Icon	Description	
🏂 🖬 Debug	Debugs the current subprogram using the NaturalONE debug attach server and the current values defined in the editor. For information, see <i>Debug a Subprogram Directly</i> .	
	Note: This toolbar icon is only visible in the Test Subprogram editor and when the Use debug	
	attach server option is selected in the Eclipse Preferences > Software AG > Natural > Debug Attach Settings window; it is not available in the Test Business Service editor.	
Run Test	Runs the current file using the values defined in the editor. Use the down arrow to display the available environments in which to run the test and select a different environment. For example	
	local Natural runtime Natural RPC Server (2) Natural RPC Server Natural RPC Mainframe <custom></custom>	
	Stops the current test.	
	Records the test data for export to a CSV file (file extension <i>.csv</i>), which can then be used as input for an external data unit test. After selecting this option, either the record function for the test will begin or the Define External Test Details panel will be displayed to define the external data unit test. To change details about the recording, select the down arrow. For example: Configure Recording	
	Data to a CSV File.	
4	Exports test data (field names and values) from the data tree in the test editor view to a new or existing test data file (extension <i>.tstdata</i>) in the workspace. For information, see <i>Export Test Data</i> .	
2	Imports an existing test data file in the workspace to the data tree in the test editor view by matching field names in the imported test data file to field names in the editor tree. For information, see <i>Import Test Data</i> .	
5	Resets all data values and structures to their default values.	

Test a Business Service or Subprogram Directly

Test a Business Service Directly	. 20
Test a Subprogram Directly	. 30
Debug a Subprogram Directly	. 32
Export/Import Test Data	. 34
Export Test Data to a CSV File	. 37

This section describes how to test a business service or subprogram directly. It provides an easy way to run a business service or subprogram by analyzing the parameters, displaying them in a test editor (tester), and allowing you to change the input values. You can then run the test and verify the return values.

Test a Business Service Directly

This section describes how to test a business service directly. The following topics are covered:

- Test the Service
- Define Date and Time Details
- Define Connections
- Define Additional RPC Environments
- Save as a Business Service Unit Test

Note: The subprograms used for the service must be available locally. If they are not available locally, download them from the server.

Test the Service

> To test a business service directly

- 1 Open the context menu for the business service in the **Navigator** view.
- 2 Select Testing.

The testing options for business services are displayed. For example:

3 Select Test Business Service.

The business service is displayed in the editor view. For example:

Calculator 🛛		- 8
Test Business Service		Q. = 🔀 🗠 🕁 🕤 📀
Data Business service: DEMO.Calculator Method: Add 💌		
 ■ INPUT-DATA ■ OUTPUT-DATA 	Property	Value
Data Connection		

Note: For information on using this editor, see *Features of the Test Editors*.

4 Expand the **INPUT-DATA** and **OUTPUT-DATA** nodes.

The **Data** tab displays the properties and values defined for each parameter used in the test. For example:

Calculator 🛛		- 8
Test Business Service		9, • 🔳 🐉 • 🖆 🖆 🧿
Data Business service: DEMO.Calculator Method: Add V		
INPUT-DATA #FUNCTION -> #FIRST-NUM -> 0 #SECOND-NUM -> 0 #SUCCESS-CRITERIA -> 0 OUTPUT-DATA #RESULT -> 0 #TIME #SUCCESS -> false	Property	Value
Data Connection		

5 Select each input and output field to use in the test and define the value for the Value property.

For example:

Parameter	Value
FIRST-NUM	2
SECOND-NUM	3
RESULT	5
SUCCESS	true (select Value to change the value from false to true)

Optionally, you can:

Task	Procedure
Define test data for another method used by the business service.	Select the method in Method . Note: Changing the method may change which subprogram is tested; the parameters may also change.
Define input parameters for the test.	Expand the INPUT-DATA node and provide input values for each property in Property and Value .
Define output parameters for the test.	Expand the OUTPUT-DATA node and provide output values for each property in Property and Value .
Reset all data values and structures to their default values.	Select the Reset Data toolbar icon. For example: >
Enter date and/or time details.	See Define Date and Time Details.
Run the test in another environment.	See Define Connections.
Interrupt a test that continues to run with no response.	Select the Stop Test toolbar icon. For example:
Export and import test data for business services and subprograms.	See Export/Import Test Data.
Record test data and then export it to a CSV file (file extension <i>.csv</i>).	See Export Test Data to a CSV File.

6 Select \mathbb{Q} to start the test.

Define Date and Time Details

When defining the value for a date and/or time field in a subprogram used by a business service, a window is displayed to enter details about the date or time. This section describes how to access and define details about a date or time field.

\gg To define details about a date or time field

1 Select **Value** for a date or time field in the testing editor.

For example:

🗈 Calculator 🛛		- 8
Test Business Service		9, • 🔳 🔀 • 🖻 🖆 😏 🧿
Data		
Business service: DEMO.Calculator		
Method: 🖌 🖌		
P INPUT-DATA	Property	Value
#FUNCTION ->	🖃 Misc	
	IDL	#TIME (T)
#SLCCOND-NON > 0	Name	#TIME
	- Value Value	
	Value	
···· #TIME		
#SUCCESS -> false		
Data Connection		

2 Select in the **Value** column.

The Enter Date/Time window is displayed. For example:

🖬 Enter Date/Time	
🔲 Blank date/time	
Date:	1/26/2012 💲
Time:	6:10:41 PM 💲
Fraction (1/10 second): 1	
ОК	Cancel

By default, the current date and time are displayed. Optionally, you can:

Task	Procedure
Blank out date and time information when testing business services or subprograms.	Select Blank date/time .
Change the date used for the test.	To change the month, select the up or down arrow for Date .
	To change the day, select the day portion of Date and then select the up or down arrow.
	To change the year, select the year portion of Date and then select the up or down arrow.

Task	Procedure
Change the time used for the test.	To change the hour, select the up or down arrow for Time .
	To change the minute, select the minute portion of Time and then select the up or down arrow.
	To change the second, select the second portion of Time and then select the up or down arrow.
Use tenths of a second to define the time used for the test.	Enter the number of tenths of a second in Fraction .

Define Connections

This section describes the **Connection** tab in the editor view. This tab is used to maintain information about the environment in which the test will run.

\gg To define the connection settings

1 Select the **Connection** tab for the test.

For example:

脑 Calculator 🛛	
Connection	0
Connection Settin	gs
RPC environment:	Natural RPC Mainframe
	Note: To maintain values for this setting, see Preferences/SoftwareAG/EntireX/RPC Environments.
Custom setting	S
Custom connect	tion
Broker ID:	IBM2.HQ.SAG:4010
Server:	RPC/NBS53DEV/CALLNAT
User ID:	PWRUSR
Password:	
Vatural logon	required
RPC user ID:	PWRUSR
RPC password:	
✓ Set project step	libs
Data Connection	

This tab shows the current connection settings for the RPC environment. For this example, the settings define a Natural RPC Mainframe environment derived directly from NaturalONE, as well as settings indicating how the RPC server will be started.

2 Select the environment in which to run the test in **RPC environment**.

This value defines the name of an EntireX RPC connection configured in Eclipse.

Note: The list of environments is defined in the **Preferences** window for RPC environments. For information on adding additional environments to the list, see *Define Additional RPC Environments*.

Or:

Select **Custom settings** and define the custom connection as follows:

Setting	Description
Broker ID	Broker identifier. Each installation of EntireX is assigned a Broker ID. This number uniquely identifies EntireX to your network. If you do not know the Broker ID, ask the network administrator for your organization.
Server	Name of the Broker server used to logically describe a server (rather than the name of the program that implements the server). This allows you to change the program name without affecting the client programs that use the service.
User ID	User identifier the server will use to assign the corresponding fields in the EntireX control block when making calls using the EntireX ACI (Advanced Communication Interface).
Password	Password value the server will use to assign the corresponding fields in the EntireX control block.
Natural logon required	Determines whether a Natural logon is required.
RPC user ID	User identifier the EntireX RPC server will use to connect with the Natural server.
RPC password	Password value the EntireX RPC server will use to connect with the Natural server.

- 3 Use the **Set project steplibs** check box to indicate whether the steplibs from the Natural project are set in the RPC server environment. If checked, the Natural Development Server is used. If not checked, only the RPC server environment is used, without Natural Development Server.
 - **Note:** Keep in mind that the Natural Development Server used by the project must always be accessible when the value is checked. The Natural Development Server is accessed to check the development mode settings for the steplib consolidation. These steplibs are then passed to the RPC server.
- 4 Save the connection settings.

Define Additional RPC Environments

You can define additional RPC environments. Once new environments have been added, they can be selected in **RPC environment** on the **Connection** tab.

> To define additional RPC environments

- 1 Select **Preferences** on the **Window** menu. The **Preferences** window is displayed.
- 2 Expand the **Software AG** node.
- 3 Select EntireX > RPC Environments.

The **RPC Environments** settings are displayed. For example:

Preferences				
type filter text	RPC Environments		¢	• 🔿 • 👻
😑 Software AG	Software AG Manage the DDC Environments for YMI (SOAD DDC Server, Natural DDC Server and TDL Extractor for DL/T			
Ajax Developer				
Business Services	Table of defined RPC environments:			
Code Generation	Name 🔺	Broker ID	Server Address	Insert
E Construct	Natural RPC Mainframe	IBM2.HQ.SAG:4010	RPC/NBS53DEV/CALLNAT	
	Natural RPC Server	BKR13003:4010	RPC/NBS53DEV/CALLNAT	Edit
.NET wrapper	Natural RPC Server (2)	localhost:1971	RPC/NATSRV2800/CALLNAT	Duplicate
COBOL Wrapper	ML/SOAP RPC Server	localhost:1971	RPC/XMLSERVER/CALLNAT	Dapiredee
Custom Wrapper	XML/SOAP RPC Server (2)	localhost:1971	RPC/XMLSERVER/CALLNAT	Remove
- Deployment Environments				
EJB Wrapper				-
IDL Extractor for COBOL				-

····· XML Mapping Editor				-
. Natural				
?			ок (Cancel

4 Select Insert.

The New RPC Environment panel is displayed.

5 Select Natural RPC Server in Type.

The specification fields for this type of server are displayed. For example:

RPC Environments			
New RPC Environment			
Define a new RPC Environment.			
Type: Natural RPC Server			
Broker Parameters			
Broker ID:			
Server Address: *Edit			
Timeout (Seconds): 60			
EntireX Authentication RPC Server Authentication			
User ID: RPC User ID:			
Password: RPC Password:			
Extractor Settings			
Library Name:			
Program Name:			
Wrapper Settings			
◯ Stow ◯ Save ⊙ Save local			
Target Library Name; *			
Environment Name			
Default			
O Other:			
(?) < Back Next > Finish Cancel			

6 Provide the following details about the new environment:

Section	Description
Broker parameters	Type the broker ID, server address, and default timeout values in the fields provided.
EntireX authentication	Type the user ID and password for EntireX in the fields provided.
RPC server authentication	Type the user ID and password for the RPC server in the fields provided.
Extractor settings	Type the name of the library and program from which to extract data in the fields provided.
Wrapper settings	If the new environment is not a local environment, select Stow or Save and provide the name of the library in which to stow or save wrapper subprograms in Target library name .

Section	Description
Environment name	After entering the Broker parameters, the default name of the new
	environment is displayed in this section. If you do not want to use the
	default name, select Other and provide a new name.

For more information about the settings on this panel, refer to the EntireX documentation.

7 Select Finish.

Save as a Business Service Unit Test

After defining the input and output parameters for the test, you can save it as a business service unit test.

> To save the test as a business service unit test

1 Select **Save As** on the **File** menu.

The Define Business Service Unit Test Details panel is displayed. For example:

🔀 New Busin	ness Service Unit Test				
Define Business Service Unit Test Details Enter the settings for a new business service unit test.			N ¹		
Target					
Project:	NewProject				Browse
Parent suite:				(default)	Browse
Test name:	Calculator				
	(/Testing-Suites/Calculator.bsrvtst)				
	Generate default Construct tests				
	✓ Display generated file(s)				
Business serv	vice				
Service file:	NewProject/Business-Services/DEMO/Calculator.v1.1.1.bsrv				Browse
Method:	Add 🔽				
?		< Back	Next >	Finish	Cancel

2 Provide details for the unit test.

For information, see *Create a Unit Test for a Business Service*.

Note: You can create Ant scripts to run unit tests (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). For information, see *Creating Ant Scripts to Run Unit Tests*.

Test a Subprogram Directly

This section describes how to test a subprogram directly. The following topics are covered:

- Access the Test Function
- Access the Debug Function
- Save as a Natural Unit Test

Note: The subprogram must be available locally. If the subprogram is not available locally, download it from the server.

Access the Test Function

To access the function to test a subprogram directly

1 Open the context menu for the subprogram in the **Navigator** view.

Or:

Open the context menu for the subprogram in the editor view.

Or:

Open the context menu for the subprogram in the **Dependencies** view.

2 Select **Testing > Test Subprogram**.

The subprogram is displayed in the editor view. For example:

R CALC X			- 8	
Test Subprogram		🎄 • 🍳 • 🔳 🔀 • 🖻 🖆	> (?	
Data				
	Property	Value		
Data Connection				

This editor functions in the same way as the **Test Business Service** editor. The differences between this editor and the **Test Business Service** editor is that this editor includes the Debug
toolbar icon and the business service editor has an option to select the method (which can change which subprogram is tested internally).

Note: For information on using this editor, see *Features of the Test Editors* and *Test a Business Service Directly*.

Access the Debug Function

This section describes how to access the Debug option from the **Test Subprogram** editor.

Note: To activate the Debug function, the **Use debug attach server** option must be selected in the Eclipse **Preferences > Software AG > Natural > Debug Attach Settings** window.

> To access the Debug function

1 Open the context menu for the subprogram in the **Navigator** view.

Or:

Open the context menu for the subprogram in the editor view.

Or:

Open the context menu for the subprogram in the **Dependencies** view.

2 Select **Testing > Test Subprogram**.

The subprogram is displayed in the editor view.

³ Select ³/₁₀ on the editor toolbar to debug the subprogram using the values currently defined in the editor.

When a breakpoint is reached, the Debug perspective is displayed. For more information, see *Debug a Subprogram Directly*.

Save as a Natural Unit Test

After defining the input and output parameters for the test, you can save it as a Natural unit test.

To save the test as a Natural unit test

1 Select **Save As** on the **File** menu.

The **Define Natural Unit Test Details** panel is displayed. For example:

🔀 New Natu	ral Unit Test		
Define Natur Enter the setti	ral Unit Test Details ngs for a new Natural unit test.		N ¹
Target			
Project:	NewProject		Browse
Parent suite:		(del	fault) Browse
Test name:	CALC		
	(/Testing-Suites/CALC.nattst)		
	Generate default Construct tests		
Subprogram	NewProject/Natural, iteraties/C53DEMO/SPC/C01C_NSN		Browse
Subprogram.	New Poject/Nacural-Lbranes/CoopEnto/DKC/CALCINDN		Drowse
?		< Back Next > Finish	Cancel

2 Provide details for the unit test.

For information, see Create a Unit Test for a Subprogram.

Note: You can create Ant scripts to run unit tests (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). For information, see *Creating Ant Scripts to Run Unit Tests*.

Debug a Subprogram Directly

This section describes how to debug a subprogram via RPC using the NaturalONE debugger and the values currently defined in the editor.

Note: To activate the **Debug** context menu, the **Use debug attach server** option must be selected in the Eclipse **Preferences > Software AG > Natural > Debug Attach Settings** window.

To debug a subprogram

- 1 Open the context menu for the subprogram in the **Navigator** view.
- 2 Select NaturalONE > Debug.

The subprogram is displayed in the editor view. For example:

Ralc 🛛		- 6
Debug Subprogram		🍇 🗸 🗛 🕶 📄 🎇 🕶 🖄 🖄 🧿 🧿
Data		Debug
 INPUT-DATA #FUNCTION -> #FIRST-NUM -> 0.00 #SECOND-NUM -> 0.00 #SUCCESS-CRITERIA -> 0 OUTPUT-DATA #RESULT -> 0.00 #TIME #SUCCESS -> false 	Property	Value
Data Connection		

This editor functions in the same way as the **Test Subprogram** editor.

Select the down arrow for $\frac{1}{2}$ to select the environment in which to debug the current file using the values defined in the editor.

For example:

3

 4 Select $\frac{1}{100}$ to debug the current file using the values defined in the editor.

When a breakpoint is reached, the Debug perspective is displayed.

Tip: If you receive a WAIT timeout occurred error message, try increasing the timeout value for the selected RPC connection in the Eclipse **Preferences > Software AG > EntireX > RPC Environments** window. You can continue debugging in the Debug perspective when the editor receives the WAIT timeout error.

Notes:

1

- 1. For information on using this editor, see *Features of the Test Editors* and *Test a Subprogram Directly*.
- 2. For information on using a debug attach server, see Using the Debugger in Using NaturalONE.

Export/Import Test Data

This section describes how to export and import test data for a business service and subprogram, which allows you to populate the test data quickly without re-entering each field name. These options are:

Export test data (field names and values) from the test editor data tree to a new or existing test data file (extension *.tstdata*) in the workspace.

Note: The *.tstdata* files can be stored anywhere in the workspace.

Import an existing test data file in the workspace to the test editor (matching field names in the imported file to field names in the editor).

This section covers the following topics:

- Export Test Data
- Import Test Data

Export Test Data

- > To export test data to the workspace
- 1 Open the context menu for the business service (or subprogram) in the **Navigator** view.

The testing options are displayed.

2 Select **Test Business Service** (or **Test Subprogram**).

The business service (or subprogram) is displayed in the editor view.

The Define Details about the Test Data File window is displayed. For example:

🔀 Export Data	
Define Details about the Test Data File	
Select a destination and enter a file name; existing files will be overwritten.	
🖃 😂 NewProject->daef.eur.ad.sag-7307 (6)	
.settings	
wsstack	
🗄 🗁 Java	
🔁 lib	
🕀 🗁 Natural-Libraries	
Esting-History	
Iser-Interface-Components	
calc-bus.tstdata	
File name: calc-bus.tstdata	
(NewProject/calc-bus.tstdata)	
OK (Cancel

4 Select the location in which to export the test data file.

The last exported *.tstdata* file is selected.

- **Note:** To overwrite data, select an existing file.
- 5 Type the name of the test data file in **File name**.

By default, the ".tstdata" extension is added to the file name.

6 Select **OK** to export the test data file.

If the test data file currently exists (as shown in the example above), an overwrite confirmation dialog is displayed.

Example

The following example shows sample input for a business service test:

) Calculator 🛛		
est Business Service		Q · 🗏 🔀 · 🖻 🖄 🤉 🧷
Data Business service: DEMO.Calculator Method: Add 💙		
 INPUT-DATA #FUNCTION -> #FIRST-NUM -> 2 #SECOND-NUM -> 3 #SUCCESS-CRITERIA -> 0 OUTPUT-DATA #RESULT -> 5 #TIME #SUCCESS -> true 	Property Misc IDL Name Value Value	Value #SUCCESS (L) #SUCCESS true

After exporting the data, the following test data (*.tstdata*) file is created:

You can modify this file using key=value pairs (for example, FIELDA=value). If the key begins with a hash character (#), then the field name must be preceded by a \ character (for example, \#FIELDB=value) or the field will be skipped. All other hash characters (such as CUSTOM-ER.#NAME=value) do not require the \ character.

Tip: Using this file as an example, you can create test data files for all the functions, save the files using appropriate names, and then change the values accordingly.

Import Test Data

0

$\gg\,$ To import test data from the workspace

1 Open the context menu for the business service (or subprogram) in the **Navigator** view.

The testing options are displayed.

2 Select **Test Business Service** (or **Test Subprogram**).

The business service (or subprogram) is displayed in the editor view.

3 Select i on the editor toolbar.

The Import Data window is displayed. For example:

- 4 Select the test data file to import (only projects/folders containing test data files are listed).
- 5 Select **OK** to import the file.

Any field in the imported test data file that does not have a matching field in the test editor tree, or has a matching field containing an invalid value, will not be imported and will not stop the import process. If this situation occurs, an Error log warning is displayed showing problem fields.

Export Test Data to a CSV File

This section describes how to record the data used to test a business service or subprogram directly and then export it to a CSV file (file extension *.csv*). You can then use this file as input to create an external data unit test. For information, see *Create an External Data Unit Test*.

- To record the test data and export it to a CSV file
- 1 Open the context menu for the business service (or subprogram) in the **Navigator** view.

The testing options are displayed.

2 Select **Test Business Service** (or **Test Subprogram**).

The business service (or subprogram) is displayed in the editor view.

³ Select **1** on the NaturalONE toolbar to begin recording.

The **Define External Test Details** panel is displayed. For example:

🔀 Record Tes	t Data				
Define Extern Enter details for	al Test Details the external (.csv) file.				N ¹
Target Project: Parent suite: .csv file name: File options Delimiter: Save options:	NewProject			(default)	Browse Browse
?		< Back	Next >	Finish (Cancel

4 Type the name of the external data file in **.csv file name** or select **Browse** to display a window listing the available files for selection.

Optionally, you can use the **Define External Test Details** panel to:

Task	Procedure
Change the name of the project in which to create the external data file.	Type the name of the Natural project in Project or select Browse to display a window listing the existing projects for selection.
Provide the name(s) of a subfolder(s) in which to save the external data file. If the folder does not currently exist, it will be created for you.	Note: The project must currently exist. Type the name of the folder in Parent suite or select Browse to display a window listing the available folders for selection. By default, the external data file is stored in the Testing-Suites folder in the current project. If you specify a suite folder name, it becomes a subfolder in the
	Testing-Suites folder and the file will be stored in that folder.
Change the delimiter character used to separate input values in the external data file you are generating.	Type the character in Delimiter .
Replace test data in an existing CSV file (file extension <i>.csv</i>) with new data.	Select "Overwrite" in Save options . Note: If you specify the name of an existing file in .csv file name and the Save options is "Append" (default), the test

Task	Procedure
	data is appended to existing test data in the file. If the mode is "Overwrite", existing test data in the file will be overwritten.

5 Select Next.

The **Select Data to Record** panel is displayed. For example:

潜 Record Test Data	
Select Data to Record Select and configure the fields and data to save.	N ¹
Name I OI INPUT-DATA I OUTPUT-DATA	Input Output Index
Expand All Collapse All	
< Back	Next > Finish Cancel

6 Select Expand All.

The level 1 fields are expanded to display the lower level fields. For example:

🔀 Record Test Data				
Select Data to Record Select and configure the fields and data to save.				N ¹
Name	Input	Output	Index	
O1 INPUT-DATA				
02 #FUNCTION (A30)				
02 #FIRST-NUM (N5.2)				
02 #SECOND-NUM (N5.2)				
02 #SUCCESS-CRITERIA (N5)				
01 OUTPUT-DATA				
02 #RESULT (N11.2)				
02 #TIME (T)				
02 #SUCCESS (L)				
Expand All Collapse All				
?	Next >	Fir	ish	Cancel

- Note: To collapse the fields, select Collapse All.
- 7 Select **Input** and/or **Output** for each level 1 field you want to include in the recording.

Only the selected data for each field will be saved.

- 8 Provide index values in **Index** for any array fields.
- 9 Select **Finish** to begin recording.

The **Recording** icon changes to **b** on the toolbar.

10 Define the test data in the editor view.

For example:

-

🚯 Calculator 🛛		
Test Business Service		9. • 🔳 🔀 • 🖻 🖬 🖕 🧿
Data Business service: DEMO.Calculator Method: Add		
 INPUT-DATA #FUNCTION -> #FIRST-NUM -> 1 #SECOND-NUM -> 2 #SUCCESS-CRITERIA -> 4 OUTPUT-DATA #RESULT -> 4 #TIME #SUCCESS -> false 	Property Misc IDL Name Value Value	Value #SUCCESS (L) #SUCCESS false
Data Connection		

Note: For information on using this editor, see *Features of the Test Editors* and *Test a Business Service Directly*.

11 Select **Q** to run the test.

Repeat steps 10 and 11 for each test containing data you want to record.

12 Select 🏂 to stop recording.

The generated CSV file is displayed in the **Testing-Suites** node in the **Navigator** view.

Create a Unit Test for a Business Service or Subprogram

Enable for Application Testing	44
Create a Unit Test for a Business Service	45
Create a Unit Test for a Subprogram	63
Generate Default Unit Tests	66
Create a New Unit Test Suite	76
Create Summary Reports for Unit Test Log Files	78
Use the Dependencies View	83

This section describes how to create a Natural unit test for a business service or subprogram. This allows you to specify a business service or subprogram to test, supply input values, and then provide validation criteria for the output of the call (for example, you can supply two numbers as the input values and a value for the result field as the validation criteria).

Note: You can create Ant scripts to run unit tests (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). For information, see *Creating Ant Scripts to Run Unit Tests*.

Enable for Application Testing

When you create a new unit test, the Natural project containing the test is automatically enabled for application testing. This will create the **Testing-Suites** folder in the **Navigator** view and provide warning markers on existing unit test files that are not in the **Testing-Suites** folder or its subfolders. This section describes how to manually enable a Natural project for application testing.

\gg To enable a Natural project for application testing

- 1 Open the context menu in the **Navigator** view for the Natural project containing the business service or subprogram you want to test.
- 2 Select **Testing > Enable for Application Testing**.

For example:

The **Testing-Suites** folder is added to the project. All new unit tests will be generated into this folder (or subfolder).

Create a Unit Test for a Business Service

This section describes how to create a unit test for a business service. The following topics are covered:

- Create the Unit Test
- Configure Input Parameters
- Define Validations
- Run the Unit Test
- Open a Previous Unit Test
- Run a Unit Test in Another Environment

- Test for an Expected Error
- Test an Array Field

Create the Unit Test

> To create a unit test for a business service

1 Open the context menu for the Natural project containing the business service in the **Navigator** view.

Or:

Open the context menu for the business service in the **Navigator** view.

2 Select **Testing**.

The test options for business services are displayed. For example:

3 Select Create Unit Test.

The **Define Business Service Unit Test Details** panel is displayed. For example:

New Busi	ness Service Unit Test			
Define Busir Enter the sett	ness Service Unit Test Details ings for a new business service unit test.			N ¹
- Target				
Project:	NewProject			Browse
Parent suite:				(default) Browse
Test name:	Calculator			
	(/Testing-Suites/Calculator.bsrvtst) Generate default Construct tests			
	☑ Display generated file(s)			
-Business serv	vice			
Service file:	NewProject/Business-Services/DEMO/Calculator.v1.1.1.bsrv			Browse
Method:	Add 🐱			
·				
?		< Back	Vext > Fir	ish Cancel

Using this panel, you can:

Task	Procedure
Change the name of the project in which to create the unit test.	Type the name of the Natural project in Project or select Browse to display a window listing the existing projects for selection. Note: The project must currently exist.
Provide the name(s) of a subfolder(s) in which to save the unit test. If the folder does not currently exist, it will be created for you.	Type the name of the folder in Parent suite or select Browse to display a window listing the available folders for selection. By default, the unit test is stored in the Testing-Suites folder in the current project. If you specify a suite folder name, it becomes a subfolder in the Testing-Suites folder and the unit test will be stored in that folder.
Change the default name for the unit test.	Type a new name in Test name . File names are saved with the <i>.bsrvtst</i> extension.
Generate default unit tests for object-maintenance functions and/or object-browse keys defined for business service subprograms.	Select Generate default Construct tests . This option is enabled when the unit test will be created for a business service that uses Velocity or Construct-generated object-browse or object-maintenance subprograms. For information, see <i>Generate Default Unit Tests</i> .
Not display the generated files in the editor view after generation.	Deselect Display generated file(s) .
Change the location of the folder containing the business service file.	Type or select a new folder in Service file .

Task	Procedure
Select a different method to test.	Select the method in Method .

4 Select Finish.

The unit test is displayed in the **Testing-Suites** folder in the **Navigator** view. For example:

The test is also displayed in the editor view. For example:

Reaculator.bsrvtst 🕱	- 8
Summary	9. 🔳 🕐
▼ Natural	
Project: NewProject	
Business service: DEMO.Calculator.v1.1.1	
Method: Add	
▼ Connection	
Broker ID: localhost:1971	
Server: RPC/NATSRV2800/CALLNAT	
▼ Input	
▼ Validation	
- Envoy	
Expect error	
Error class:	
Error code:	
Message:	Regex
Summary Connection Input Validation	

The **Summary** tab displays information about the test, such as the name of the project, business service, and method. It also displays the default connection settings. To define another connection in which to run the test, see *Define Connections*.

Note: You can use this tab to define an expected error, which allows a test to pass whenever the expected error occurs. You can also use the tab to search for specified text in an error message. For information, see *Test for an Expected Error*.

5 Select the **Input** tab and define which input parameters are sent to the server.

For information, see *Configure Input Parameters*.

6 Select the **Validation** tab and define which values must be returned for a successful test.

For information, see *Define Validations*.

Note: You can create Ant scripts to run business service unit tests (file extension *.bsrvtst*).For information, see *Creating Ant Scripts to Run Unit Tests*.

Configure Input Parameters

> To configure the input parameters sent to the server

1 Select the **Input** tab in the unit test editor.

For example:

MCUSTN_GET_1.nattst 🛛				
Input				9 🔳 🕐
Configure the input fields to be sent to	the server.			
Field Name	Index	Value		Add
CUSTOMER.CUSTOMER-NUMBER CDAOBJ2.#FUNCTION		11111 GET		Edit
				Delete
				Duplicate
				Add Array

2 Select Add.

The **Configure Input Field** window is displayed. For example:

🔒 Configu	ıre Input Field 🛛 🛛 🛛	
Field name:	INPUT-DATA.#FUNCTION	
Index:		
Value		
		ļ
	OK Cancel	

The list of available controls in **Field name** is based on the data type of the input field. If you selected a logical field, for example, two option buttons are displayed to select "true" or "false". If the field is an array, you can type the index for the array in **Index**.

- 3 Select the name of the input field in **Field name**.
- 4 Type the field value in **Value**.
- 5 Select OK.

The new field is added to the list of fields on the **Input** tab.

Optionally, you can use the **Input** tab to:

Task	Procedure
Edit an input field.	See Edit an Input Field.
Remove one or more input fields.	Select one or more input fields in Field Name using standard selection techniques and select Delete . The field(s) is removed from the list of fields and will not be sent to the server.
Duplicate an input field.	See Duplicate an Input Field.
Add multiple elements to an array field.	See <i>Add Multiple Elements for an Array Field</i> . This option is enabled when the PDA contains array fields.

Edit an Input Field

> To edit an input field

- 1 Select the input field in **Field Name** on the **Input** tab.
- 2 Select Edit.

The **Configure Input Field** window is displayed to edit the field information.

3 Select **OK** to save the changes.

Or:

Select the input field in Field Name and edit the Value and/or Index values within the table.

Duplicate an Input Field

- > To duplicate an input field
- 1 Select the input field in **Field Name** on the **Input** tab.
- 2 Select Duplicate.

The **Configure Input Field** window is displayed to edit the field information.

3 Select **OK** to save the duplicate field.

Add Multiple Elements for an Array Field

This section describes how to define a range of values for an array field.

Note: The **Add Array** option does not support byte array and date/time fields.

\gg To add multiple elements to an array field at the same time

1 Select Add Array.

The **Define Array Element Details** window is displayed. For example:

🔒 Add Arra	y Elements	
Define Arra	ay Element Details	
Enter elemen	ts of the array, one entry per line.	
Field name:	AWHD.WAREHOUSE-PROVINCE (A20)	<u> </u>
Parent index:		
Value(s)		
		<u>~</u>
		×
?	ОК	Cancel
Ŭ		

- 2 Type each element of the array in **Value(s)**, one entry per line.
- 3 Select **OK** to save the array field.

Define Validations

This section describes how to create unit test validations for Natural errors and data entry based on validator types (i.e., not restricted to characters in the data type).

> To define validations

1 Select the **Validation** tab in the business service unit test editor.

For example:

RCUSTN_GET_1.nattst				- 8
Validation				Q. 🔳 🕐
Configure fields to be tested after the cal	to the ser	rver is made.		
Field Name	Index	Value	Validator	Add
MSG-INFO.##MSG			ComparisonVali	
MSG-INFO,##RETURN-CODE			StringValidator	Edit
				Delete
				Duplicate
				Dapiedern
				Add Array
Summary Connection Input Validation				

2 Select Add.

The **Configure Field Validation** window is displayed. For example:

🔒 Config	ure Field Validation	×
Field name:	INPUT-DATA.#FUNCTION	~
Index:		
Validator:	StringValidator	~
Value		
Value:		
		5
	OK Cancel	

The list of available controls in **Field name** is based on the data type of the input field. If you select a logical field, for example, two option buttons are displayed to select "true" or "false". If the field is an array, you can type the index for the array in **Index**.

- 3 Select the name of the input field in **Field name**.
- 4 Select the type of validator to use for the input field in **Validator**.

The type of validator to use depends on the type of data in the field. The available validators are:

- BooleanValidator
- ByteValidator
- ComparisonValidator (displays a combo box with the options: ">", "<", "=", "<=", ">=")
- DateValidator

- DecimalValidator
- IntegerValidator
- RegexValidator (creates regular expressions to validate the contents of a field)
- StringValidator
- TimeValidator
- 5 Select **OK**.

The new field is added to the list of fields on the **Validation** tab.

Optionally, you can use the **Validation** tab to:

Task	Procedure
Edit a field validation.	See Edit a Field Validation.
Remove one or more field validations.	Select one or more fields in Field Name using standard selection techniques and select Delete . The field validation(s) is removed.
Duplicate a field validation.	See Duplicate a Field Validation.
Add multiple validations for an array field.	See <i>Add Multiple Validations for an Array Field</i> . This option is enabled when the PDA contains array fields.

Edit a Field Validation

> To edit a field validation

- 1 Select the field in **Field Name** on the **Validation** tab.
- 2 Select Edit.

The **Configure Field Validation** window is displayed to edit the field information.

3 Select **OK** to save the changes.

Or:

Select the input field in Field Name and edit the Value and/or Index values within the table.

Duplicate a Field Validation

> To duplicate a field validation

- 1 Select the input field in **Field Name** on the **Input** tab.
- 2 Select **Duplicate**.

The **Configure Field Validation** window is displayed to edit the information.

3 Select **OK** to save the duplicate field validation.

Add Multiple Validations for an Array Field

This section describes how to define validations for an array field.

Note: The **Add Array** option does not support byte array and date/time fields.

> To add multiple validations to an array field

1 Select Add Array.

The **Define Array Element Details** window is displayed. For example:

🔒 Add Arra	y Elements	
Define Arra Enter elemer	ay Element Details ts of the array, one entry per line.	8
Field name: Parent index:	AWHD.WAREHOUSE-PROVINCE (A20)	✓
Validator: Value(s)	StringValidator	~
		~
<		>
?	ОК	Cancel

- 2 Type each element of the array in **Value(s)**, one entry per line.
- 3 Select **OK** to save the array field.

Run the Unit Test

This section describes how to run one or more unit tests. It includes information about the **Natural Unit Test** window.

Note: You can create Ant scripts to run unit tests (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). For information, see *Creating Ant Scripts to Run Unit Tests*.

> To run one or more unit tests

- 1 Open the context menu for one of the following items in the **Navigator** view.
 - A project containing the **Testing-Suites** folder.
 - The **Testing-Suites** folder or a subfolder within the folder.
 - One or more unit test files (file extension *.nattst* or *.bsrvtst*), regardless of where they exist. Use standard selection techniques to open the unit test(s). Any test files stored outside of the **Testing-Suites** folder display a warning marker in the **Navigator** view and an entry in the **Problems** view indicating that they are not in the proper place.
- 2 Select **Testing > Run Unit Test(s)**.
 - **Note:** You can also use the context menu to change the environment in which a test is run. For information, see *Run a Unit Test in Another Environment*.

The selected tests are displayed in the editor view and the results of the test are displayed in the **Natural Unit Test** view. For example:

Note: If the test did not pass, a red circle (B) is displayed on the test icon in the **Tests** section and **State: failed** is displayed in the **Summary** section.

The following table describes each of the options available on the toolbar for the **Natural Unit Test** view:

Toolbar Icon	Description
Q.	Runs the current unit test using the values defined in the editor view.
	Tip: You can also select Solution in the editor view to run the test.
8	Selects the current unit test in the editor view.
	Opens the business service or Natural subprogram used for the current unit test in the editor view.
₩	Displays the test history for the last 10 unit tests that were run during the current Eclipse session and allows you to select a previous test and load it into the editor. For information, see <i>Open a Previous Unit Test</i> .

The **Tests** section in the **Natural Unit Test** view displays the name of each unit tests that have been run. You can use the context menu for a unit test in the **Tests** section to select more options. For example:

Properties 📴 Natural L	Init Test 🛛	9. 🗟 🚮 🖬 -	
Tests	Summary		
E🛱 Calculator.bsrvtst (D	Carter Calculate Run Ropen unit test Calculator.bsrvtst Open Calculator.v1.1.1.bsrv	v=bsrvtst Vatural RPC Mainframe (Broker ID: IBM2.HQ.SAG:4010) 78s	~
	<		>

Using this menu, you can:

Task	Procedure
Run the unit test.	Select Run.
Open the unit test file in the editor view.	Select Open unit test <i>UnitTestName</i> . The following file types are available for selection:
	business service (file extension .bsrvtst)
	external data (file extension <i>.exttst</i>)
	Natural unit test (file extension .nattst)
	sequence (file extension .seqtst)
Open the associated business service or Natural subprogram file in the editor view.	Select Open <i>BusinessServiceName</i> . bsrv or Open <i>NaturalSubprogramName</i> . NSN . The following file types are available for selection:
	business service (file extension .bsrv)
	external data (file extension .NSN)
	Note: This option is not available for external data or sequence unit
	tests.

The **Summary** section in the **Natural Unit Test** view displays:

- Name of the test
- Name of the RPC connection
- Whether the test passed or failed
- Length of time in seconds that the unit test executed before completing

To see the results of another test, select the test in the **Tests** section and the results are displayed in the **Summary** section. For example:

Properties 🔛 Natural Unit Test 🛛	💁 🖓 🚮 🖬 🖬 -	- 8
Tests	Summary	
Calculator.bsrvtst (2.062s)	Test:Calculator.bsrvtst RPC connection: Natural RPC Mainframe (Broker ID: IBM2.HQ.5AG:4010) State: passed Elapsed time: 2.062s	~
		~
		>

Open a Previous Unit Test

> To open a previous unit test

1 Select **a** • on the toolbar in the **Natural Unit Test** view.

A list of the last 10 tests run during the current Eclipse session is displayed with a message indicating the success of each test. For example:

🔲 Properties 📴 Natural Unit Test 🛛		9. R. II	-	- 8
Tests	Summary	📓 Calc.exttst (passed)		
🗉 🔛 Calc.exttst (1.125s)	Test: Calc.exttst	🔛 Calc.exttst (failed)		~
	State: passed Flansed time: 1, 125s	📓 MCUSTN_NEXT.nattst (passed)		
	Liapsed time, 1,1255	🔀 MCUSTN_STORE.nattst (passed)		
		🔀 MCUSTN_EXISTS.nattst (passed)		
		🚱 Customer_GET_1.bsrvtst (failed)		
	2	📓 Calculator.bsrvtst (passed)		>
		🔀 Customer_EXISTS.bsrvtst (failed)		<u> </u>
		🔛 CALC.nattst (passed)		
		MCUSTN_EXISTS.nattst (passed)		

In this example, seven tests passed and three tests failed.

2 Select the test you want to open.

The test is displayed in the Natural Unit Test view. For example:

🔲 Properties 🔛 Natural Unit Test 🛛	9. 🔉 🚮 🖬 - 🗆 🗖
Tests	Summary
Ex Calculator.bsrvtst (0.578s)	Test:Calculator.bsrvtst RPC connection: Natural RPC Mainframe (Broker ID: IBM2.HQ.SAG:4010) State: passed Elapsed time: 0.578s

- 3 Open the context menu for the test.
- 4 Select the unit test file in **Open unit test** *UnitTestName.nnntst*.

The following unit test file types are available:

- business service (file extension .bsrvtst)
- external data (file extension .exttst)
- Natural unit test (file extension .nattst)
- sequence (file extension .seqtst)

Run a Unit Test in Another Environment

You can run any unit test in another environment.

> To run a unit test in another environment

- 1 Open the context menu for one of the following items in the **Navigator** view.
 - A project containing the **Testing-Suites** folder.
 - The **Testing-Suites** folder or a subfolder within the folder.
 - One or more unit test files (file extension .bsrvtst, .exttst, .nattst, and .seqtst), regardless of where they exist.

2 Select Testing > Run Unit Test(s) using Environment.

For example:

3 Select the environment in which you want to run the test.

The results of the test are displayed in the Natural Unit Test view.

Note: The list of environments is defined in the **Preferences** window for RPC environments. For information on adding additional environments to the list, see *Define Additional RPC Environments*.

Test for an Expected Error

To allow a test to pass with an expected error, define information about the error in the **Error** section of the **Summary** tab. For example:

▼ Error	
Expect error	
Error class:	
Error code:	
Message:	Regex
Summary Input Validation Connection	

This will allow a test to fail only if it encounters an unexpected error.

> To test for an expected error

- 1 Select **Expect error**.
- 2 Type the error class in **Error class**.

For Natural errors, the error class is 1014.

3 Type the error code in **Error code**.

You can also use the Error section to search the message text for a specific string.

\gg To search the message text for a specified string

- 1 Type the string in **Message**.
- 2 Select **Regex**.

If you specify ".* division by zero.*", for example, Regex will search for "division by zero" anywhere in the error message.

Test an Array Field

You can expand or reduce an X-array using the Resize Array property. For example:

E 1-SOME-PARMS UNI-FIELD -> ROWS[]	Property Val	lue
	🖃 Array	
	Preserve data true	e
	Resize Array 20	
	Misc	
	Name ROV	WS[

For some arrays, all values are displayed. For example:

E1-SOME-PARMS	Property Value
	🖃 Array
	Preserve data true
	Resize Array 10
	Misc
	IDL ROWS (A10/V10) InOut
	Name ROWS
	Value
	Value (1)
	Value (2)
	Value (3)
	Value (4)
	Value (5)
	Value (6)
	Value (7)
	Value (8)
	Value (9)
	Value (10)

Create a Unit Test for a Subprogram

> To create a unit test for a subprogram

1 Open the context menu for the Natural project containing the subprogram in the **Navigator** view.

Or:

Open the context menu for the subprogram in the **Navigator** view.

2 Select **Testing**.

The test options for subprograms are displayed.

3 Select Create Unit Test.

The **Define Natural Unit Test Details** panel is displayed. For example:

🔀 New Natu	ral Unit Test			
Define Natur Enter the setti	ral Unit Test Details ngs for a new Natural unit test.			N ¹
Target				
Project:	NewProject			Browse
Parent suite:			(default) Browse
Test name:	CALC			
	(/Testing-Suites/CALC.nattst)			
	Generate default Construct tests			
	Display generated file(s)			
Natural				
Subprogram:	NewProject/Natural-Libraries/C53DEMO/SRC/CALC.NSN			Browse
?		< Back Nex	kt > Finish	Cancel

Using this panel, you can:

Task	Procedure
Change the name of the project in which to create the unit test.	Type the name of the Natural project in Project or select Browse to display a window listing the existing projects for selection. Note: The project must currently exist.
Provide the name(s) of a subfolder(s) in which to save the unit test. If the folder does not currently exist, it will be created for you.	Type the name of the folder in Parent suite or select Browse to display a window listing the available folders for selection. By default, the unit test is stored in the Testing-Suites folder in the current project. If you specify a suite folder name, it becomes a subfolder in the Testing-Suites folder and the unit test will be stored in that folder.
Change the default name for the unit test.	Type a new name in Test name . File names are saved with the <i>.bsrvtst</i> extension.
Generate default unit tests for object-maintenance functions and/or object-browse keys defined for Natural subprograms.	Select Generate default Construct tests . This option is enabled when the unit test will be created for Velocity or Construct-generated object-browse or object-maintenance subprograms. For information, see <i>Generate Default Unit</i> <i>Tests</i> .
Not display the generated files in the editor view after generation.	Deselect Display generated file(s) .

Task	Procedure
Change the location of the folder containing the subprogram file.	Type or select a new folder in Subprogram .

4 Select **Finish**.

The unit test is displayed in the **Testing-Suites** folder in the **Navigator** view. For example:

The test is also displayed in the editor view. For example:

CALC.nattst 🛛	- 8
Summary	9 🔳 🧿
▼ Natural	
Project: NewProject Library: DEMOTEST Subprogram: CALC	
Connection	
Broker ID: IBM2.HQ.SAG:4010 Server: RPC/NB553DEV/CALLNAT	
▼ Input	
✓ Validation	
▼ Error	
Expect error	
Error class:	
Error code:	
Message:	Regex
Summary Connection Input Validation	

The **Summary** tab displays information about the test, such as the name of the project, library, and subprogram. It also displays the default connection settings. To define another connection in which to run the test, see *Define Connections*.

Note: You can use this tab to define an expected error, which allows a test to pass when the expected error occurs. You can also use the tab to search for specified text in an error message. For information, see *Test for an Expected Error*.

5 Select the **Input** tab and define which input parameters are sent to the server.

For information, see *Configure Input Parameters*.

6 Select the **Validation** tab and define which values must be returned for a successful test.

For information, see *Define Validations*.

7 Run the test.

For information, see *Run the Unit Test*.

Note: You can create Ant scripts to run Natural unit tests (file extension *.nattst*). For information, see *Creating Ant Scripts to Run Unit Tests*.

Generate Default Unit Tests

This section describes how to generate default unit tests for browse keys and maintenance functions (for example, GET, NEXT, etc.) defined for Velocity or Construct-generated object-browse or objectmaintenance subprograms. If a business service uses both object-browse and object-maintenance subprograms, default tests can be generated for both the browse keys and the maintenance functions.

This section covers the following topics:

• Generate Tests for a Business Service
• Generate Tests for a Natural Subprogram

Generate Tests for a Business Service

- > To generate default unit tests for a business service
- 1 Select **Testing > Create Unit Test** from the context menu for the business service in the **Nav-igator** view.

The **Define Business Service Unit Test Details** panel is displayed.

2 Select Generate default Construct tests.

For example:

🞽 New Busin	ness Service Unit Test				
Define Busin Enter the setti	ess Service Unit Test Details ngs for a new business service unit test.				N ¹
Target Project:	NewProject				Browse
Parent suite:				(d	efault) Browse
Test name:	Customer (/Testing-Suites/Customer.bsrvtst) V Generate default Construct tests V Display generated file(s)				
Business serv	ice				
Service file:	NewProject/Business-Services/DEMO/Customer.v1.1.1.bsrv				Browse
Method:	BROWSE				
?		< Back	Next >	Finish	Cancel

Note: This option is only available when the business service uses one or more subprograms that were generated by an Object-Browse and/or Object-Maint wizard (either Velocity-based or Construct).

3 Select Next.

The Define Parameters for the Default Maintenance Tests panel is displayed. For example:

New Business Service Unit Test								
Define Parameters for the Default Maintenance Tests Image: Configure parameters for the generated tests. Select and configure parameters for the generated tests. Image: Configure parameters for the generated tests.								
Parent suite fol Select which tes	Parent suite folder:/Testing-Suites Select which tests to generate:							
Generate	Function		Unit Test Nam	Э		Populate Key		
V	EXISTS		Customer_EXIS	iTS_1		V		
V	FORMER		Customer_FOR	MER_1				
V	GET		Customer_GET	_1				
V	INITIALIZE		Customer_INIT	IALIZE_1				
V	NEXT		Customer_NEX	T_1				
	STORE		Customer_STO	RE_1				
Generate All Provide values	Generate None							
Field Name		Value						
CUSTOMER.	CUSTOMER-NUMBER (N5)	0						
Note: Some tests may fail because the specified key field value(s) may not exist.								
?				< Back	Next > Fir	nish Cancel		

Note: If the business service does not use any object-maintenance subprograms, the **Define Parameters for the Default Browse Tests** is displayed.

This panel displays the functions defined for all object-maintenance subprograms used by the business service, as well as the key fields. Using this panel, you can:

Task	Procedure
Limit the generation of one or more default tests.	Deselect Generate for the unit test(s) you do not want to have generated. To generate unit tests for all functions, select Generate All .
Limit the generation of all default tests.	Select Generate None.
Change the default population of key fields.	Select or deselect Populate Key for the default unit test(s). When selected, the test for the corresponding function will populate the key field with the value specified in Value .
Provide a value for a key field.	Select Value for the key field and type the value. For example, you can provide a customer number for the Customer number field.
Enter details for a date/time field (when defining details for a date or time field).	See Define Date and Time Details.

Default tests can be created for each function defined for the subprogram that does not require an existing record to be on hold. These functions are:

- STORE
- GET
- NEXT
- FORMER
- EXISTS
- INITIALIZE

Note: As the DELETE and UPDATE functions require an existing record to be held, default tests are not generated for these functions.

4 Specify a key value in **Value** for each function.

The tests are designed with the assumption that this value exists (i.e., the test will pass when the value exists). The following assumptions are also made:

Function	Assumption
STORE	Assumes the specified key value exists and expects an error from the subprogram saying the value already exists.
FORMER	Assumes a key value is not entered and expects a message from the subprogram saying the beginning of file condition has occurred.
NEXT	Assumes that the end of file condition has not occurred and expects a message from the subprogram saying the next record was retrieved successfully.

The key components are those listed in the object PDA for the object-maintenance subprogram as elementary fields under STRUCTURE. For example, MCUSTN, an object-maintenance subprogram used by the Customer business service (located in the SYSBIZDE library), uses the MCUSTA PDA:

	1 MCUSTA-ID	Ν	5 /*	Object identifier
R	1 MCUSTA-ID		/*	REDEF. BEGIN : MCUSTA-I
	2 STRUCTURE		/*	To allow MOVE BY NAME
	3 CUSTOMER-NUMBER	Ν	5	

In this example, CUSTOMER-NUMBER will be used as the key.

5 Select Finish.

Unit tests are created for all available browse keys and any object-maintenance subprogram functions selected on the **Define Parameters for the Default Maintenance Tests** panel.

Or:

Select Next.

The Define Parameters for the Default Browse Tests panel is displayed. For example:

🔀 New Busi	ness Service Unit Test		
Define Para Select and co	meters for the Default Browse Te nfigure parameters for the generated tests.	sts	N ¹
Parent suite fo	older:/Testing-Suites		
Generate	Кеу	Unit Test Name	
	NAME	Customer-ByNAME	
	NAME-BACKWARDS	Customer-ByNAME-BACKWARD5	
V	NAME-WAREHOUSE	Customer-ByNAME-WAREHOUSE	
V	CUSTOMER-NUMBER	Customer-ByCUSTOMER-NUMBER	
V	CUSTOMER-NUMBER-BACKWARDS	Customer-ByCUSTOMER-NUMBER-BACKWARDS	
Generate Al	I) Generate None		
?		< Back Next > Finish	Cancel

Note: If the business service does not use any object-browse subprograms, **Next** is not available on the **Define Parameters for the Default Maintenance Tests** panel.

This panel displays the key fields defined for all object-browse subprograms used by the business service. Using this panel, you can:

Task	Procedure
Limit the generation of one or more default	Deselect Generate for the unit test(s) you do not want to
tests.	have generated. To generate unit tests for all keys, select
	Generate All.
Change the name of a default unit test.	Type the new name for the unit test on the corresponding
	line in Unit Test Name .
Limit the generation of all default tests.	Select Generate None.

Default tests can be created for each browse key defined for the subprogram. These tests include default validations for items like rows returned and error codes. For a HISTOGRAM key, key value totals can be verified.

6 Select Finish.

-

The default unit tests are displayed in the **Testing-Suites** folder in the **Navigator** view. For example:

The tests are also displayed in the editor view. For example:

Real Customer-ByNAME-BACK	Customer-ByNAME-WARE	Customer-ByCUSTOMER-	Customer-ByCUSTOMER-	x »,	- 8

		Delete
		Delete
		Duplicate
		add arrow
		Add Array
Summary Connection Input Validation		

Note: For more information, see *Configure Input Parameters*.

Select the **Validation** tab to change the validations generated for the test. For example:

Customer-ByCUSTOMER-NUMBER-BAC	KWARDS.	bsrvtst 🛛		- 0
Validation				9 🔳 🧿
Configure fields to be tested after the cal	l to the sei	rver is made.		
Field Name	Index	Value	Validator	Add
CDBRPDA.ACTUAL-ROWS-RETURNED MSG-INFO.##RETURN-CODE ACUSTP.PREV-REQ		0	ComparisonVali ComparisonVali ComparisonVali	Edit Delete Duplicate Add Array
Summary Connection Input Validation				

Notes:

4

- 1. For more information, see *Define Validations*.
- 2. You can create Ant scripts to run unit tests (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). For information, see *Creating Ant Scripts to Run Unit Tests*.

Generate Tests for a Natural Subprogram

- > To generate default unit tests for a Natural subprogram
- 1 Select **Testing > Create Unit Test** from the context menu for the subprogram in the **Navigator** view.

The **Define Natural Unit Test Details** panel is displayed.

2 Select Generate default Construct tests.

For example:

🔀 New Natu	ıral Unit Test				
Define Natu Enter the sett	ral Unit Test Details ings for a new Natural unit test.				N ¹
← Target ——					
Project:	NewProject				Browse
Parent suite:				(default)	Browse
Test name:	MCUSTN				
	(/Testing-Suites)				
	Generate default Construct tests				
	✓ Display generated file(s)				
Natural					
Subprogram:	NewProject/Natural-Libraries/DEMOTEST/SRC/MCUSTN.NSN				Browse
?		< Back	Next >	Finish	Cancel

Note: This option is only available when the subprogram was generated by an Object-Browse or Object-Maint wizard (either Velocity-based or Construct).

3 Select Next.

If the subprogram was generated by an Object-Maint wizard, the **Define Parameters for the Default Maintenance Tests** panel is displayed. For example:

🔁 New Natural Unit Test							
Define Parameters for the Default Maintenance Tests Image: Configure parameters for the generated tests. Select and configure parameters for the generated tests. Image: Configure parameters for the generated tests.							
Parent suite folder:/Testing-Suites Select which tests to generate:							
Generate	Function		Unit Test Nam	e			Populate Key
	STORE		MCUSTN_STOP	RE_2			V
V	GET		MCUSTN_GET_	2			V
v	NEXT		MCUSTN_NEXT	_2			
V	FORMER		MCUSTN_FOR	MER_2			
v	EXISTS		MCUSTN_EXISTS_2			V	
	INITIALIZE		MCUSTN_INIT:	ALIZE_2			
Generate All Provide values	Generate None						
Field Name		Value					
CUSTOMER.	CUSTOMER-NUMBER (N5)	0					
Note: Some tests may fail because the specified key field value(s) may not exist.							
?				< Back	Next >	Finis	h Cancel

This panel is similar to the **Define Parameters for the Default Maintenance Tests** panel for a business service unit test. For a description of this panel, see *Generate Tests for a Business Service*.

Or:

If the subprogram was generated by an Object-Browse wizard, the **Define Parameters for the Default Browse Tests** is displayed. For example:

🖥 New Natural Unit Test 📃 🗖 🔀							
Define Parameters for the Default Browse Tests Image: Comparison of the generated tests Select and configure parameters for the generated tests. Image: Comparison of the generated tests

This editor is similar to the editor for a business service unit test. For a description of the editor, see *Generate Tests for a Business Service*.

Create a New Unit Test Suite

This section describes how to create a new unit test suite to organize and store your Natural and business service unit tests (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). The tests are generated into the **Testing-Suites** folder or subfolder within a specified Natural project.

Note: Ant scripts for Natural unit tests may contain unit test files existing outside of the **Testing-Suites** folder or subfolder.

IO create a new unit test suite	\geq	То	create	а	new	unit	test	suite
---------------------------------	--------	----	--------	---	-----	------	------	-------

1 Select **Testing > Create Test Suite** for a project in the **Navigator** view.

Or:

Select **Testing-Suites > Create Test Suite** in the **Navigator** view.

Or:

Select **Testing-Suites** > *SubfolderName* > **Create Test Suite** in the **Navigator** view.

The **Define Test Suite Details** panel is displayed. For example:

New Test	Suite		
Define Test Suite Details Enter the target settings for a new test suite.			
Target Project: Parent suite: Suite name:	NewProject	Browse (default) Browse	
?		Finish Cancel	

Using this panel, you can:

Task	Procedure
Change the name of the project in which to create the test suite.	Type the name of the Natural project in Project or select Browse to display a window listing the existing projects for selection. Note: The project must currently exist.
Provide the name(s) of a subfolder(s) in which to save the unit test. If the folder does not currently exist, it will be created for you.	Type the name of the folder in Parent suite or select Browse to display a window listing the available folders for selection. By default, the unit test is stored in the Testing-Suites folder in the current project. If you specify a suite folder name, it becomes a subfolder in the Testing-Suites folder and the unit test will be stored in that folder

2 Type the name of the test suite in **Suite name**.

3 Select Finish.

The test suite is generated into the **Testing-Suites** folder or subfolder.

Create Summary Reports for Unit Test Log Files

This section describes how to create unit test log files and then use the log files to create summary reports. Log files can be created for any subprogram and business service unit test executed within a NaturalONE project.

This section covers the following topics:

- Create Unit Test Log Files
- Generate a Summary Report

Create Unit Test Log Files

A unit test history log file can be created to save the results of a unit test whenever it is executed (for example, the test name, test status, date/time completed, error messages, etc.). To create these files, you must select the option in the **Preferences** window for **Testing**. For information, see *Set Logging Preferences for Unit Tests*.

Generate a Summary Report

> To generate a report

1 Select **Testing > Create Unit Test Report** for a project in the **Navigator** view.

Or:

Select **Testing-History > Testing > Create Unit Test Report** in the **Navigator** view.

The **Define Report Details** panel is displayed. For example:

🔀 New Unit Test Report	
Define Report Details Enter settings for the report parameters.	N ¹
Project: NewProject Report: Detail Date criteria Start date: 12/28/2011 End date: 12/28/2011	
?	Finish Cancel

- **Note:** To change the name of the Natural project, type the name of the project in **Project** or select **Browse** to display a window listing the existing projects for selection.
- 2 Type or select the name of the report in **Report**.

The report types are Detail, Daily summary, History chart and Weekly summary (see below for an example of each report).

- 3 Select the range of dates for the report in **Date criteria**.
- 4 Select Finish.

The report types are:

Total (Pass/Fail)		2 / 5		
Jan 8, 2012 9:50 AM				

This report shows:

- Name project containing the tests, as well as the range of dates included in the report
- Name of each test

- User ID of the person who executed the unit test (or Unknown if the user ID cannot be determined)
- Whether the test passed (true) or failed (false)
- Elapsed time (in seconds) that the test took to run
- Error message for tests that failed
- Total number of tests that passed or failed
- Date and time the report was created

Daily Summary

This report calculates and displays a daily Pass/Fail summary from every unit test executed within a selected range of dates.

History Chart

This report provides a graph of the Pass/Fail count for each **Testing-History** log file created within a selected range of dates.

Weekly Summary

This report calculates and displays a weekly Pass/Fail summary from every unit test executed within a selected range of dates.

Use the Dependencies View

When a generated module is open in the editor view, the **Dependencies** view displays dependencies between business service and Natural unit tests and the business services and Natural subprograms they execute. This section describes the nodes contributed to the view for these resources. The following topics are covered:

- Business Service Unit Test Resources
- Natural Subprogram Unit Test Resources

Notes:

- 1. Select $\downarrow_{\mathbb{Z}}^{a}$ to sort the resources alphabetically.
- 2. Select d to export a textual representation of the visible nodes in the view to a file.
- 3. When a supporting resource cannot be found locally using the project steplib chain and project references, "<Unknown>" is displayed with the name of the resource. If the unknown module(s)

is not shipped with the Construct runtime project, either manually download it from the server or create it locally. If the module(s) is shipped with the Construct runtime project, add the project. For information, see NaturalONE's *Code Generation* documentation.

4. For more information about the **Dependencies** view, see the description of the source editor in *Using NaturalONE*.

Business Service Unit Test Resources

When a business service unit test is open in the editor view, the root node displays the name of

the business service unit test. In caller mode (), no child nodes are displayed because no other **Dependencies** view objects depend on this business service unit test file. For example:

In callee mode (), the child nodes display the name of the business service that the unit test executes, along with the names of the supporting business service resources and the names of the libraries and projects in which they are located. For example:

Natural Subprogram Unit Test Resources

When a Natural subprogram unit test is open in the editor view, the root node displays the name of the unit test. In caller mode (), no child nodes are displayed because no other **Dependencies** view objects depend on a unit test file; in callee mode (), the child node displays the name of the Natural subprogram that the unit test executes, along with the names of the supporting Natural resources and the names of the libraries and projects in which they are located. For example:

	×		N R (1	∎ ↓ <mark>a</mark>	⊿	
E 🗟 Acustn E 🚮 Demo	TEST:ACL	JSTN				

7 Create an External Data Unit Test

Create the Unit Test	8	6
Configure Column Mappings and Sample Data	9	1

This section describes how to create a unit test that accepts input and/or validations from a CSV file (file extension *.csv*). You can create a unit test once and then provide a data file containing different input or validations to run iterations of the test. The wizard creates a unit test file that accepts data from the CSV file.

Note: Similar to other unit tests, external data unit tests can be run from the unit test Ant script. For information, see *Creating Ant Scripts to Run Unit Tests*.

Create the Unit Test

> To create an external data unit test

1 Select **Testing > Create External Data Unit Test** for a project in the **Navigator** view.

Or:

Select **Testing-Suites > Create External Data Unit Test** in the **Navigator** view.

Or:

Select **Testing-Suites**> *SubfolderName* > **Create External Data Unit Test** in the **Navigator** view.

The Define External Data Unit Test Details panel is displayed. For example:

🚪 New External Data Unit Test						
Define External Data Unit Test Details Enter the settings for a new external data unit test.						
Target	Target					
Project:	NewProject	Browse				
Parent suite:	CalculatorTests	Browse				
Test name:						
Source unit te O Create new O Use existin Source data f O Create new O Use existin	Display generated file(s) st details w test g test (CSV) details w file g file	Browse				
?	< Back Next > Finish	Cancel				

Using this panel, you can:

Task	Procedure
Change the name of the project in which to create the external data unit test.	Type the name of the Natural project in Project or select Browse to display a window listing the existing projects for selection. Note: The project must currently exist.
Provide the name(s) of a subfolder(s) in which to save the external data unit test. If the folder does not currently exist, it will be created for you.	Type the name of the folder in Parent suite or select Browse to display a window listing the available folders for selection. By default, the unit test is stored in the Testing-Suites folder in the current project. If you specify a suite folder name, it becomes a subfolder in the Testing-Suites folder and the unit test will be stored in that folder.

- 2 Type the name of the external data unit test in **Test name**.
- 3 Select an existing business service or Natural unit test in the **Source unit test details** section.

The selected unit test will be executed for each row in the data file. To display the available unit test files for selection, select **Browse** for **Use existing test**. Optionally you can create a new business service or Natural unit test. For information, see *Create a New Unit Test*.

4 Select an existing data file in the **Source data file (CSV) details** section.

To display the available CSV data files for selection, select **Browse** for **Use existing file**. Optionally you can create a new data file. For information, see *Create a New Data File*.

- **Note:** A wizard is available to record the sample data used to test a business service or subprogram directly and then export the data to a CSV file. For information, see *Export Test Data to a CSV File*.
- 5 Select Finish.

The external data unit test file is generated into the **Testing-Suites** folder (or subfolder) and listed in the **Navigator** view. For example:

The *.exttst* file is also displayed in the editor view.

Note: The .csv file and/or the .nattst/.bsrvtst files may also be created.

6 Define the configuration settings for the unit test in the editor view.

For information, see Configure Column Mappings and Sample Data.

7 Select the **Connection** tab and define the connection settings for the unit test.

For information, see *Define Connections*.

8 Save the settings.

Create a New Unit Test

> To create a new unit test

- 1 Select **Create new test** in the **Source details** section on the **Define External Data Unit Test Details** panel.
- 2 Select Next.

The Define New Unit Test Details panel is displayed. For example:

🖥 New External Data Unit Test
Define New Unit Test Details Enter the settings for a new unit test.
Test details New test name: (/Testing-Suites/ExternalSuite) Source details Object type: • Subprogram • Business service Object path: Browse
Cancel

- 3 Type the name of the unit test in **New test name**.
- 4 Select the object type for the source unit test in **Object type**.

You can select either **Subprogram** (the default) or **Business service**. When **Business service** is selected, an additional field is added to the panel. For example:

🔀 New Externa	l Data Unit Test
Define New Uni Enter test name	it Test Details
Test details	
New test name:	
	(/Testing-Suites/ExternalSuite)
Source details -]
Object type:	◯ Subprogram
Object path:	Browse
Object method:	▼
?	<pre></pre>

5 Select **Browse** in **Object path**.

A list of available business service or subprogram unit test files is displayed. Select the unit test to use for the external data unit test and select **OK**.

- 6 For a business service unit test, select the method to test in **Object method**.
- 7 Select **Finish** to create the external data unit test and new unit test.

Or:

Select **Next** to create a new data file.

Note: This option is only available when **Create new file** is selected on the **Define Ex-ternal Data Unit Test Details** panel.

Create a New Data File

- > To create a new data file
- 1 Select **Create new file** in the **Source data file (CSV) details** section on the **Define External Data Unit Test Details** panel.
- 2 Select Next.

The **Define New Data File Details** panel is displayed. For example:

🚪 New External Data	a Unit Test	
Define New Data File Enter the settings for a r	e Details new data file (CSV).	N ¹
Data file (CSV) details - New data file name:	./Testing-Suites/ExternalSuite)	
Row details Delimiter: ,	e All Select All Deselect All	
?	< Back Next > Finish	Cancel

Note: If **Create new test** on the **Define External Data Unit Test Details** panel is also selected, the **Define New Unit Test Details** panel is displayed before this panel.

3 Type the name of the data file in **New data file name**.

Using this panel, you can:

-

Task	Procedure
Change the character used to separate entries in the first row of the CSV file.	Type a new character in Delimiter .
Reserve the first row in the CSV file for the field names.	Select First row contains field names . At runtime, the first row in the CSV file is reserved for field names.
	Note: When selecting fields for the first row in a CSV file, you cannot specify the number of occurrences of an array to include. By default, a maximum of five occurrences of each array will be included. To add and/or remove occurrences from the generated CSV file, you must edit the file manually.
Display fields that can be selected for the first row of the CSV file.	Select Expand All . To close the tree view, select Collapse All .
Select fields to be included in the first row of the CSV file.	Select Select All and then deselect the fields you do not want to include in the CSV file. To deselect all fields, select Deselect All .

4 Select **Finish** to create the external data unit test, a new data file, and optionally, a new unit test.

Configure Column Mappings and Sample Data

This section describes how to map columns in the CSV file (file extension *.csv*) to fields in the PDA used by the business service or subprogram unit test. The following CSV file was used for examples:

```
#FUNCTION, INPUT-DATA.#FIRST-NUM, INPUT-DATA.#SECOND-NUM, INPUT-DATA.#SUCCESS-CRITERIA, OUTPUT-DATA.#RESULT, OUTPUT-DATA.#SUCCESS
Add, 1, 2, 3, 3, FALSE
Add, 1, 9, 10, 10, TRUE
```

> To configure column mappings and sample data

1 Select the **Configuration** tab in the editor for the external data unit test.

For example:

									-
ontigur	atior	1							Q = (
General									
Init test file	:: E	xternalSuite/CALC.n	attst						Browse
Data file (CSV): ExternalSuite/calculator.csv						Browse			
	No	ote: file paths are rela	ative to the Te:	sting-S	uites ro	ot folder.			
First row	contain:	s field names		-					
olumn delir	niter: ,								
Column	Mappin	gs							
Column	Field I	Name		Index		Validator		Criteria	Add
1	INPUT	-DATA.#FUNCTION							Edit
2	INPUT-DATA.#FIRST-NUM								
3	INPUT-DATA.#SECOND-NUM							Delet	
4 5	OUTPUT-DATA #PESULT								
6	OUTPL	JT-DATA.#SUCCESS							
-									
						-			
Sample	Data								
1: #FUNC	TION	2: INPUT-DAT	3: INPUT-D/	ΑT	4: IN	PUT-DAT	5: OUTPUT-DA	6: OUTPUT-DA	Refres
Add		1	2		4		4	FALSE	Map
Add		1	9		10		10	TRUE	_ map

2 Select Add in the Column Mappings section.

The Edit Mapping window is displayed. For example:

🔀 Edit Mappi	ng 🛛 🗙
Edit Mapping Configure mapp	ing entry settings
Column number:	þ
Field name:	×
Index:	
Validator:	×
Criteria:	✓
?	OK Cancel

The number of the first unmapped column is displayed in **Column number**. You can change this number to define the mapping for another column.

- 3 Select the name of the field to use for this column in **Field name**.
- 4 Type the index position in **Index** (used when the field is an array).
- 5 Select the type of validator to use for the field in **Validator**.

The type of validator to use depends on the type of data in the field. The available validators are:

- BooleanValidator
- ByteValidator
- ComparisonValidator (displays a combo box with the options: ">", "<", "=", "<=", ">=")
- DateValidator
- DecimalValidator
- IntegerValidator
- RegexValidator (creates regular expressions to validate the contents of a field)
- StringValidator
- TimeValidator
- 6 Select OK.

The new column mapping is added to the list of mappings on the **Configuration** tab.

- 7 Continue adding column mappings until all columns used for the test have been added.
 - To revise a mapping, select the mapping in Column Mappings and select Edit. The Edit Mapping window is displayed to change the mapping.

To remove a mapping, select the mapping in Column Mappings and select Delete. The mapping is removed from Column Mappings.

Optionally, you can use the **Configuration** tab to:

Task	Procedure			
Change the name and/or location of the unit test file used for the external data unit test.	Type the name of the unit test in Unit test file or select Browse to display a window listing the existing unit test files for selection.			
	Note: The unit test must currently exist.			
Change the name and/or location of the CSV file containing field names	Type the name of the CSV file in Data file or select Browse to display a window listing the existing CSV files for selection.			
and input for the external data unit test.	Note: The CSV file must currently exist.			
Reserve the first row in the CSV file for the field names.	Select First row contains field names . At runtime, the first row in the CSV file is reserved for field names.			
	Note: When selecting fields for the first row in a CSV file, you			
	cannot specify the number of occurrences of an array to include.			
	By default, a maximum of five occurrences of each array will be included. To add and/or remove occurrences from the generated CSV file, you must edit the file manually.			
Change the delimiter character used to separate columns in the CSV file.	Type a new delimiter character in Column delimiter .			
Retrieve sample data from the CSV file.	Select Refresh in the Sample Data section. The first 20 rows in the CSV file are retrieved.			
	Tip: To apply changes to the external data file to the unit test,			
	use this option with the Map option.			
Map new sample data to the columns.	Select Map (enabled when the First row contains field names option is selected). A confirmation window is displayed, indicating that all current column mappings will be removed. Select Yes to delete the old mappings and apply the new mappings.			

8 Save the configuration settings.

8 Create a Sequence Unit Test

Create the Unit Test	. 97
Use the Sequence Unit Test Editor	100
Use the Dependencies View	109

This section describes how to create a sequence unit test (file extension *.seqtst*), a type of unit test that executes a sequence of test steps in a specified order. Each test step executes a business service or Natural unit test and, optionally, copies data between steps, applies field overrides, defines validation overrides. and/or applies method overrides (business service unit tests only). These overrides do not physically change the existing unit test files; the values are only changed in memory prior to execution of the files.

For example, a sequence test can have the following two steps:

- 1. Invoke a unit test for a Construct-generated object-maintenance subprogram and attempt to retrieve (GET) a data record.
- 2. Re-invoke the same test, but apply a field override that attempts to update the record. In addition, copy all data from Step 1 and pre-configure each input field.

There are several methods you can use to create a sequence unit test, depending on your requirements. These methods include:

Create one generic business service or Natural unit test and then create a sequence unit test containing several test steps that reference the same generic unit test, but use a different field override.

For example, you can create a generic Natural unit test called WAREHOUSE.nattst and then create a unit test that reference a sequence of unit tests to override the value of WARE-HOUSE.#FUNCTION, such as WAREHOUSE_GET.nattst, WAREHOUSE_NEXT.nattst, etc.

Create several business service and/or Natural unit tests that reference the same subprogram/PDA and then create a sequence unit test that references each unit test in a specified sequence.

For example, you can create a unit test for each warehouse function, such as WARE-HOUSE_GET.nattst, WAREHOUSE_NEXT.nattst, etc., and then create a unit test that invokes these tests in a specified sequence.

- Create several business service and/or Natural unit tests that reference different subprograms/PDAs and then create a sequence unit test that references each unit test in a specified sequence and copies data from one test to the next.
- Create a sequence unit test and one or more unit tests to use for the test.

Create the Unit Test

This section describes how to use the wizard to create a sequence unit test.

> To create a sequence unit test

- 1 Open the context menu for one of the following items in the **Navigator** view:
 - Project folder
 - **Testing-Suites** folder or subfolder
 - One or more business service and/or Natural unit test files (using standard selection techniques). The tests can reference the same subprogram/PDA or different subprograms/PDAs. The wizard will create one test step in the generated sequence unit test for each unit test selected in the Navigator view.
- 2 Select **Testing > Create Sequence Unit Test**.

The **Define Sequence Unit Test Details** panel is displayed. For example:

🖥 New Sequence Unit Test						
Define Sequence Unit Test Details Enter the settings for a new sequence unit test.						
Target						
Project:	NewProject	Browse				
Parent suite:		(default) Browse				
Test name:						
	✓ Display generated file(s)					
?		Finish Cancel				

3 Type the name of the sequence unit test in **Test name**.

Optionally, you can:

Task	Procedure
Change the name of the project in which to create the sequence unit test.	Type the name of the Natural project in Project or select Browse to display a window listing the existing projects for selection. Note: The project must currently exist.
Provide the name(s) of a subfolder(s) in which to save the sequence unit test. If the folder does not currently exist, it will be generated for you.	Type the name of the folder in Parent suite or select Browse to display a window listing the available folders for selection. By default, the unit test is stored in the Testing-Suites folder in the current project. If you specify a suite folder name, it becomes a subfolder in the Testing-Suites folder and the unit test will be stored in that folder.

4 Select Finish.

The sequence unit test file is generated into the **Testing-Suites** folder (or subfolder) and listed in the **Navigator** view. For example:

The *.seqtst* file is also displayed in the editor view. For example:

😰 CustomerUpdate.seqtst 🛛	
Configuration	9 ₂ 🔳 🕐
Test Steps Define test steps and optional overrides.	Test Step Details Set the properties for the selected step or override.
Configuration Connection	

If one unit test file was selected in the **Navigator** view, a default test step is created for that file. For example:

😰 CustomerUpdate.seqtst 🛛			- 8
Configuration			9. 🔳 🕐
Test Steps Define test steps and optional overrides. Tests/MCUSTN.nattst)	Add	Test Step Details Set the properties for the selected step or over Name: Step 1	ride.
	Remove Up Down	Unit test file: Customer Tests/MCUSTN.nattst	Browse
		Copy data Copy the data from a previous step Step name:	V

If several unit test files were selected in the **Navigator** view, one test step is created for each test. For example:

😰 CustomerMaint.seqtst 🛛			- 8
Configuration			9 🔳 🕐
Test Steps Define test steps and optional overrides. Step_2 (Customer_GET.bsrvtst) Step_3 (Customer_GET.bsrvtst) Step_4 (Customer-ByCUSTOMER-NUMBER-BACKWARDS.bsrvtst) Step_5 (Customer-ByCUSTOMER-NUMBER.bsrvtst) Step_7 (Customer-ByNAME-BACKWARDS.bsrvtst) Step_7 (Customer-ByNAME-WAREHOUSE.bsrvtst)	Add Remove Up Down	Test Step Details Set the properties for the selected step or override. Name: Step_1 Description:	Browse
Configuration Connection		Copy data Copy the data from a previous step Step name:	×

Use the Sequence Unit Test Editor

This section describes how to use the sequence unit test editor. The following topics are covered:

- Add Test Steps
- Copy Data from a Previous Step
- Add an Input Override
- Add a Validation Override
- Add a Method Override
- Notes:

- 1. For information about the **Connections** tab, see *Define Connections*.
- 2. For general information about using the test editors, see Features of the Test Editors

Add Test Steps

This section describes how to add test steps to execute business service and/or Natural unit tests in a specified order. Each test step executes one existing unit test and, optionally, copies data between steps, applies field overrides, and/or defines validation overrides. In the following example, the sequence unit test is generated from the context menu for a project and no steps are created. For example:

shingar actorn			
Test Steps		Test Step Details	
Derine test steps and optional overrides.	Add Remove Up Down	Set the properties for the selected step of override.	

Note: To resize the editor sections, select the sash and move it left or right.

> To add test steps

1 Select Add.

The **Test Step Details** section is displayed. For example:

😰 *CustomerUpdate.seqtst 🛛		- 8
Seconfiguration Test step 'Step_1': Unit test file path is empty.		9 = 0
Test Steps Define test steps and optional overrides. Add Remove Up Down	Test Step Details Set the properties for the selected step or overrid Name: Step_1 Description:	le.
Configuration Connection	Copy data Copy the data from a previous step Step name:	×

2 Select **Browse** for **Unit test file**.

The **Select Unit Test** window is displayed. Select the unit test file and **OK**. The unit test details are displayed in the **Test Steps** section and the selected unit test file is displayed in **Unit test file**. For example:

🙀 *CustomerUpdate.seqtst 🛛		
Configuration	Q. 🔳 🤅)
Test Steps Define test steps and optional overrides. Step_1 (Customer_GET.bsrvtst) Add Remove Up Down	Test Step Details Set the properties for the selected step or override. Name: Step_1 Description: Image: Customer_GET.bsrvtst Unit test file: Customer_GET.bsrvtst	
	Copy data Copy the data from a previous step Step name:	

Or:

Select New for Unit test file.

The **Select Unit Test Type** panel is displayed. For example:

🐕 New Unit Test	
Select Unit Test Type Select the type of unit test to create.	N ¹
Business Service Unit Test	
(?) < Back Next > Finish	Cancel

Select one of the following options:

Business Service Unit Test

The **Define Business Service Unit Test Details** panel is displayed. For information, see *Create a Unit Test for a Business Service*.

Natural Unit Test

The **Define Natural Unit Test Details** panel is displayed. For information, see *Create a Unit Test for a Subprogram*.

Note: When accessing these panels from the sequence unit test editor, the project name defaults to the name of the project containing the sequence unit test and is read-only. The unit test file specified for each test step must contain a relative path to the Testing-Suites folder in the project containing the sequence unit test.

After defining the unit test and selecting **Finish**, the unit test details are displayed in the **Test Steps** section and the newly created unit test file is displayed in **Unit test file**.

3 Select Add.

The second test step is displayed in **Test Steps** and the **Copy data** section is enabled. For example:
😭 *CustomerUpdate.seqtst 🛛	
Configuration	9. 🗏 🤊
Test Steps Define test steps and optional overrides. Step_1 (Customer_GET.bsrvtst) Add Remove Up Down	Test Step Details Set the properties for the selected step or override. Name: Step_2 Description: Unit test file: Customer_GET.bsrvtst Browse New Copy data
	Step name:
Configuration Connection	Copy data Copy the data from a previous step Step name:

4 Select or create the unit test for the second test step.

Repeat steps 1 and 2 until all test steps have been added. Optionally, you can use this editor to:

Task	Procedure
Provide a description of this test step.	Type a description of the test step in Description (maximum of 250 characters). The first 60 characters are displayed as the tool tip for the test step in Test Steps .
Copy data from a previous step.	See Copy Data from a Previous Step.
Delete a test step.	Select the test step in Test Steps and select Remove or open the context menu for the test step and select Delete .
Reorder the test steps.	Select the test step in Test Steps and select Up or Down .
Provide a name for the test step.	Type the step name in Name .
Define an input override for a field used in a test step.	See Add an Input Override.
Define a validation override for a field used in a test step.	See Add a Validation Override.
Define a method override for a method used in a test step (business service unit tests only).	See Add a Method Override.

5 Save the settings.

Copy Data from a Previous Step

This section describes how to copy data from a previous test step. When the generated sequence test is run, the test step will attempt to copy the data from the specified test step. If the test steps share the same Natural unit test file, the entire data structure from the previous test step is copied. If the test steps use different Natural unit test files, each field is copied by name and the level 1 name (if present) is compared to the field name.

Caution: All values are copied, even when the Natural formats are different. This may result in conversion errors (for example, when alpha values are placed in numeric fields).

> To copy data from a previous test step

- 1 Select the test step to which you want to copy the data.
- 2 Select Copy data from a previous step.
- 3 Select the test step from which you want to copy the data in **Step name**.

You can select any previous test step in the list. Only previous test steps are listed, as data cannot be copied from a test step that has not been run.

Note: When defining input or validation overrides, you can also select the field from which to copy the data.

Add an Input Override

This section describes how to add an input override for a field. This value will override any input value defined for an input field with the same name in the original unit test file. For example, if the original unit test file has an input field and value of FUNCTION=GET and you add an override to a test step that sets FUNCTION=UPDATE, then FUNCTION=UPDATE will be used.

> To add an input override

- 1 Open the context menu for the test step in **Test Steps**.
- 2 Select **New > Input Override**.

The field details are displayed in **Test Step Details**. For example:

🚯 *CustomerUpdate.seqtst 🛛			- 6
Configuration			Q. 🔳 🕐
Test Steps Define test steps and optional overrides. Image: Step_1 (Customer Tests/MCUSTN_GET.nattst) Image: Step_2 (Customer Tests/MCUSTN_NEXT.nattst) Image: Step_2 (Customer Tests/MCUSTN_NEXT.nattst)	Add Remove Up Down	Test Step Details Set the properties for the selected step or override. Field name: CUSTOMER.CUSTOMER-NUMBER Index:	
coninguration connection			

3 Type the override value in **Value**.

The input override is displayed in Test Steps. For example:

😰 *CustomerUpdate.seqtst 🛛	- B
Configuration	9 = ?
Test Steps Define test steps and optional overrides. Step_1 (Customer Tests/MCUSTN_GET.nattst) CUSTOMER.CUSTOMER-NUMBER ('111') Step_2 (Customer Tests/MCUSTN_NEXT.nattst) Up Down	Test Step Details Set the properties for the selected step or override. Field name: CUSTOMER.CUSTOMER.NUMBER Index: Index: Value: 111 Copy data Copy the data from a previous step Step name: Image:
Configuration Connection	

In this example, an override value for the CUSTOMER-NUMBER field has been added.

Notes:

6

- 1. For information about the input parameters, see *Configure Input Parameters*.
- 2. You can copy the field data from a previous step. For information, see *Copy Data from a Previous Step*.
- 3. To remove an input override, either select the override in **Test Steps** and select **Remove** or open the context menu for the override and select **Delete**.

Add a Validation Override

This section describes how to add an override value for a field validation. This value will override any validation defined for an input field with the same name in the original unit test file. For example, if the original unit test file has a field validation of $\#MSG \iff ERROR$ and you add a validation override of $\#MSG \iff WARNING$, then both validations will be used (i.e., the wizard will ensure that the message is not equal to both ERROR and WARNING).

> To add a validation override

- 1 Open the context menu for the test step in **Test Steps**.
- 2 Select **New > Validation Override**.

The validation details are displayed in **Test Step Details**. For example:

🚯 *CustomerUpdate.seqtst 🛛	- 8
Configuration Test Steps Define test steps and optional overrides. CUSTOMER.CUSTOMER.NUMBER ('111') CUSTOMER.CUSTOMER.NUMBER ('111') CUSTOMER.CUSTOMER.NUMBER ('') CUSTOMER.CUSTOMER.NUMBER ('') CUSTOMER Tests/MCUSTN_NEXT.nattst) Up Dow	Test Step Details Set the properties for the selected step or override. Field name: CUSTOMER.CUSTOMER-NUMBER ve Index: Validator: StringValidator Value:
Configuration Connection	

- 3 Select the field name in **Field name**.
- 4 Select the override value in **Validator**.

The validation override is displayed in **Test Steps**. For example:

😭 *CustomerUpdate.seqtst 🛛				- 0
Configuration				Q. 🔳 🕐
Test Steps Define test steps and optional overrides. Image: Step_1 (Customer Tests/MCUSTN_GET.nattst) Image: CustomER.customER.numBER (111') Image: Customer Tests/MCUSTN_MER.timestramp (May 11, 2012 06:11:33.900 PM) Image: Customer Tests/MCUSTN_NEXT.nattst)	Add Remove Up Down	Test Step D Set the prop Field name: Index: Validator: Value:	Petails erties for the selected step or override. CUSTOMER.CUSTOMER-TIMESTAMP ImmeValdator Date: 5/11/2012 Time: 6:11:33 PM Fraction: 9	
Connigaration Connection				

In this example, an override validation for the CUSTOMER-TIMESTAMP field has been added.

- 1. For information about the validation parameters, see *Define Validations*.
- 2. You can copy the validation data from a previous step. For information, see *Copy Data from a Previous Step*.
- 3. To remove a validation override, either select the override and select **Remove** or open the context menu for the override and select **Delete**.

Add a Method Override

This section describes how to add a method override value for a business service unit test. This value will override the method name in the original business service unit test. For example, if the original unit test has a method value of "BROWSE" and you add a method override value "EXISTS" to a test step, then the sequence unit test will execute the "EXISTS" method.

\gg To add a method override

- 1 Open the context menu for the test step in **Test Steps**.
- 2 Select New > Method Override.

The method details are displayed in **Test Step Details**. For example:

🛐 *CustomerMaintenance.seqtst 🛛			- 8
Configuration			9 🗏 🖗
Test Steps Define test steps and optional overrides. Step_1 (Customer Tests/MCUSTN_EXISTS.nattst) Step_2 (Customer Tests/MCUSTN_GET.nattst) Step_3 (Customer Tests/MCUSTN_INITIALIZE.nattst) Step_4 (Customer Tests/MCUSTN_INITIALIZE.nattst) Step_5 (Customer-ByCUSTOMER-NUMBER-BACKWARDS.bsrvtst) Step_5 (Customer-ByCUSTOMER-NUMBER.bsrvtst) Step_6 (Customer-ByNAME-BACKWARDS.bsrvtst) Step_7 (Customer-ByNAME-WAREHOUSE.bsrvtst) Step_7 (Customer-ByNAME-WAREHOUSE.bsrvtst)	Add Remove	Test Step Details Set the properties for the selected step or override. Method: BROWSE	V

3 Type the override value in **Method**.

The method override is displayed in **Test Steps**. For example:

😰 *CustomerMaintenance.seqtst 🛛			- 8
Configuration			9 <mark>.</mark> 🔳 🤊
Test Steps Define test steps and optional overrides. Step_1 (Customer Tests/MCUSTN_EXISTS.nattst) Step_2 (Customer Tests/MCUSTN_GET.nattst) Step_3 (Customer Tests/MCUSTN_INITIALIZE.nattst) Step_4 (Customer-ByCUSTOMER-NUMBER-BACKWARDS.bsrvtst) Step_5 (Customer-ByCUSTOMER-NUMBER.bsrvtst) Step_6 (Customer-ByCUSTOMER-NUMBER.bsrvtst) Step_7 (Customer-ByNAME-BACKWARDS.bsrvtst) Step_7 (Customer-ByNAME-WAREHOUSE.bsrvtst)	Add Remove	Test Step Details Set the properties for the selected step or override. Method: EXISTS	~
Configuration Connection			

In this example, an override value of METHOD=EXISTS has been added.

- 1. For information about business service methods, see NaturalONE's *Business Services* documentation.
- 2. To remove a method override, either select the override in **Test Steps** and select **Remove** or open the context menu for the override and select **Delete**.

Use the Dependencies View

When a generated module is open in the editor, the **Dependencies** view displays dependencies between a sequence unit test and the unit tests executed for each test step. This section describes the nodes contributed to the view for these resources. The following topics are covered:

- Sequence Unit Test Resources
- Business Service Unit Test Resources
- Natural Unit Test Resources
- Notes:
- 1. Select $\downarrow_{\mathbb{Z}}^{a}$ to sort the resources alphabetically.
- 2. Select d to export a textual representation of the visible nodes in the view to a file.
- 3. When a supporting resource cannot be found locally using the project steplib chain and project references, "<Unknown>" is displayed with the name of the resource. If the unknown module(s) is not shipped with the Construct runtime project, either manually download it from the server or create it locally. If the module(s) is shipped with the Construct runtime project, add the project. For information, see NaturalONE's *Code Generation* documentation.
- 4. For more information about the **Dependencies** view, see the description of the source editor in *Using NaturalONE*.

Sequence Unit Test Resources

When a sequence unit test is open in the editor view, the root node displays the name of the se-

quence unit test. In caller mode ((), no child nodes are displayed because no other **Dependencies** view objects depend on this sequence unit test file. For example:

In callee mode (\square), the child nodes display one business service or Natural unit test for each test step in the sequence unit test. For example:

Business Service Unit Test Resources

In callee mode (), the child node displays the name of the business service that the unit test executes, along with the names of the supporting Natural resources and the names of the libraries and projects in which they are located. For example:

Natural Unit Test Resources

When a Natural unit test is open in the editor view, the root node displays the name of the unit test. In caller mode ((), one child node is displayed for each sequence unit test that includes this unit test in one of its test steps. For example:

In callee mode (\square), the child node displays the name of the Natural subprogram that the unit test executes, along with the names of the supporting Natural resources and the names of the libraries and projects in which they are located. For example:

9 Test an External Subroutine

Access the Subroutine Tester	114
Test with a Program	115
Test with a Subprogram	116

This section describes how to test an external subroutine. The tester can test the subroutine using either a subprogram or a program that calls a subprogram. The following tables describes which option to use:

External Subroutine Features	Test Using
No parameters and screen input/output	Program (Natural for Ajax provides the screen input/output)
Parameters and no screen input/output	Subprogram (then you can use the subprogram tester to create scripts so the tests can be run again)
	Note: If there are parameters and no screen input/output, it is easier
	to test the routine as a subprogram because the subprogram tester can handle the variety of parameters.

Regardless of which option you use, temporary Natural objects are created to perform the tests and then deleted when the Natural for Ajax page or subprogram tester is closed.

Note: If you intend to use the temporary subprograms to create a unit (batch) test for the subroutine, save the files locally before closing the tester.

Access the Subroutine Tester

> To access the subroutine tester

- 1 Open the context menu for the subroutine in the **Navigator** view.
- 2 Select **Testing**.

1

The test options for external subroutines are displayed. For example:

🔁 Navigator 🛛		
(- 🔄 📲 🖧 🏹	
ConstructRuntime->natural-run MewProject->daef.hq.sag-7307 J	time (1) 7 (1)	
 Inaturalone Isettings Isetti	New Open Open With Copy Paste Paste Move Rename Move Rename Rename Rename Rename	
	NaturalONE	•
	Testing Code Generation	 Test Subroutine with Program Test Subroutine with Subprogram
	Lipload Build Project	
	Predict Description and Generation Validate Run As Debug As Profile As Team Compare With Replace With Properties	> > > >

Test with a Program

> To test an external subroutine using a program

- 1 Open the context menu for the subroutine in the **Navigator** view.
- 2 Select **Testing > Test Subroutine with Program**.

The subroutine is tested and the results are displayed in the Natural I/O view. For example:

𝚱 Natural I/O 🖂	- 8
Natural Web I/O Output	
Hello	
Style Sheet	▼

Test with a Subprogram

> To test an external subroutine using a subprogram

- 1 Open the context menu for the subroutine in the **Navigator** view.
- 2 Select **Testing > Test Subroutine with Subprogram**.

The tester creates a temporary subprogram file to test the subroutine. For example:

R T501508T 🛛		- 8		
#A ->	Property	Value		
	🖃 Misc			
	IDL	#A (A3) InOut		
	Name	#A		
	🖃 Value			
	Value			
Run Stop Reset				
Data Connection				

Note: This editor functions in the same way as the editor used to test a subprogram. For information on using this editor, see *Features of the Test Editors* and *Test a Subprogram Directly*.

10 Test a Natural Map

This section describes how to test a Natural map in NaturalONE. The tester allows you to test a map as you would on the server (i.e., pressing PF4 in the map editor).

Note: The map must be available locally. If the map is not available locally, download it from the server.

To test a Natural map

- 1 Open the context menu for the map in the **Navigator** view.
- 2 Select **Testing**.

For example:

Ra-Navigator X			
	New	•	
NCMAIN.NSP	Open		
	Open With	•	
	T Paste		
	🔀 Delete		
	Move		
	Rename		
	- 4 Evport		
	Export		
	🗞 Refresh		
	Nah walong		
	NaturalONE		
	Testing	•	📲 Test Map
	Testing Code Generation		🏭 Test Map
	Testing Code Generation		Fie Test Map
	Testing Code Generation		Test Map
	Testing Code Generation Image: Second Secon		Test Map
	Testing Code Generation Upload Build Project Predict Description and Generation Validate		Test Map
	Testing Code Generation Upload Build Project Predict Description and Generation Validate Run As	• • •	Test Map
	Testing Code Generation Code Generation Upload Build Project Predict Description and Generation Validate Run As Debug As		Test Map
	Testing Code Generation Image: Display and the state of the st		Test Map
	Testing Code Generation Image: Display and the state of the st		Test Map
	Testing Code Generation Image: Description and Generation Predict Description and Generation Validate Run As Debug As Profile As Team Compare With		Test Map
	Testing Code Generation Upload Build Project Predict Description and Generation Validate Run As Debug As Profile As Team Compare With Replace With		Test Map
	Testing Code Generation Image: Description and Generation Predict Description and Generation Validate Run As Debug As Profile As Team Compare With Replace With Convert Map		Test Map
	Testing Code Generation Upload Build Project Predict Description and Generation Validate Run As Debug As Profile As Team Compare With Replace With Convert Map JPA Tools		Test Map

3 Select **Test Map**.

The output of the map is displayed. For example:

Watural I/O X	- 8
Natural Web I/O Output	
DICESS THE	
Code Subsystem Code: Cod	
Direct Command:	
Enter-Ff1Ff2Ff3Ff5Ff6Ff8Ff9Ff10Ff11Ff12	
Style Sheet	⊳

In addition to testing the output of the map, you can also test all code within the map. For example, you can enter "?" in an input field to display the available help information (if help has been attached to the map).

You can also apply a different style sheet to the map by selecting *b* in **Style Sheet**. For example:

🥹 Natural I/O 🛛	- 8
Natural Web I/O Output	
10CM9-1100	
Code Subsystem C Customer T Table Order P Relp P Code: P Direct Command: P	
Enter-FF1FF2FF3FF4FF5FF8FF3FF10FF11FF12	
Style Sheet	∇
Web I/O style sheet: natural.css Apply	

In this example, the default style sheet *natural.css* has been used. If you would like to see the same colors in the output window as in the map editor, you can use the style sheet *natural_mapeditor.css* instead of the default style sheet.

To change style sheets, select the file in **Web I/O style sheet** and select **Apply**. The map is redisplayed with the selected style sheet.

Setting Preferences for Application Testing

Showing the Preferences for Application Testing	122
Set Logging Preferences for Unit Tests	123
Set Server Synchronization Preferences	123

This section describes how to set preferences for the supplied test function.

Showing the Preferences for Application Testing

The preferences for Application Testing are set in the **Preferences** dialog box of Eclipse.

> To show the preferences for Application Testing

- 1 From the **Window** menu, choose **Preferences**.
- 2 In the tree of the resulting dialog box, expand the **Software AG** node and then select the **Testing** node.

The **Testing** page is displayed.

🔀 Preferences		
type filter text		Testing $\Leftrightarrow \bullet \bullet \bullet \bullet \bullet$
	^	Unit test preferences
En Ank		Log unit tests
Data Management		Upload resource(s) when they are not in sync with server
⊞-Help		
🕀 Java EE

Business Services		
Code Generation		
Predict Description and Concretion		
Request Document		
Testing		
- IDDI Registries		
Web Services Stack	~	Restore Defaults Apply
?		OK Cancel

Set Logging Preferences for Unit Tests

> To set logging preferences

- 1 Display the **Testing** page as described above.
- 2 Select Log unit tests.

Unit test log files will be created automatically each time a unit test is executed. The log files are stored in the **Testing-History** folder within the NaturalONE project in which the unit test was executed and include a *.tstlog* file extension. For example:

Note: If this option is not selected, the log files will not be created.

3 Select **OK** to save the preferences.

Set Server Synchronization Preferences

When testing a subprogram, a message may be displayed indicating that a local resource has not been uploaded to the server and synchronized with the server resource. You can set preferences for this option.

To set server synchronization preferences

- 1 Display the **Testing** page as described above.
- 2 Select one of the options listed in **Upload resource(s) when they are not in sync with server**.

These options are:

Option	Description
Always	Resource(s) are always uploaded to the server when not in sync.
Never	Resource(s) are never uploaded to the server when not in sync.
Prompt	A window is displayed to select an option.

3 Select **OK** to save the preferences.

12 Creating Ant Scripts to Run Unit Tests

Set Up the Environment	126
Generate the Ant Script and Command Files	126
Define the testsuite Ant Task	130

You can use the Ant script wizard to create XML-based Ant scripts to run unit test files (file extension *.bsrvtst, .exttst, .nattst,* and *.seqtst*). You can run the Ant script from within NaturalONE or use the external command file to execute tests via a command line. The wizard generates the following files:

- *build.xml* (contains the Ant script)
- *run.cmd* (contains the DOS command file to run the script)

For information on creating unit test files, see:

- Create a Unit Test for a Business Service
- Create a Unit Test for a Subprogram
- Create an External Data Unit Test
- Create a Sequence Unit Test

Set Up the Environment

If you use an RPC environment connection ID, the ID must be setup before running the wizard. For information, refer to the EntireX documentation.

Generate the Ant Script and Command Files

This section describes how to create the *build.xml* and *run.cmd* files.

> To create the Ant script

1 Select **New > Other** on the **File** menu.

The **Select a wizard** panel is displayed.

2 Select Software AG > Testing > Natural Unit Test Ant Script.

For example:

The New	
Select a wizard	
Wizards:	
type filter text	
Software AG Business Services Code Generation Code Generation Code Generation Service Unit Test Service Unit Test Service Unit Test Natural Unit Test Natural Unit Test Service Stack	
Rext > Finish	Cancel

3 Select Next.

The **Ant information** panel is displayed. For example:

🚪 New Natural Un	it Test Ant Script	
Ant information Enter in details to create an Ant script for Natural unit test(s)		
Eclipse root: Workspace root: Output container:	E:/SoftwareAG82/eclipse/v36/ E:/Workspaces/NaturalONE82	Browse Browse Browse
Broker connection ID: Generate .cmd file:	Natural RPC Mainframe 💌	
?	<back next=""> Finish</back>	Cancel

Using this panel, you can:

Task	Procedure
Change the location of the default root folder in Eclipse.	Select a new folder in Eclipse root .
Change the location of the default workspace folder.	Select a new folder in Workspace root .
Change the Broker connection ID.	Select a new ID in Broker connection ID .
Suppress the generation of the <i>run.cmd</i> file containing the DOS command file that runs the script.	Deselect Generate .cmd file.

- 4 Type the name of the Natural project in **Output container** or select **Browse** to display a list of available projects for selection.
- 5 Select **Next**.

The Item Selection panel is displayed. For example:

📕 New Natural Unit Test	Ant Script		
Item Selection Select items to generate			N
Fileset: Sample business service: 🗹 Sample subprogram: 🗹			Browse
?	< Back	Next > Finish	Cancel

Using this panel, you can:

Task	Procedure
Suppress the generation of a sample business service.	Deselect Sample business service.
Suppress the generation of a sample subprogram.	Deselect Sample subprogram.

6 Select the location of the default fileset folder (the workspace root folder and the output container folder) in **Fileset**.

7 Select Finish.

The generated *build.xml* and *run.cmd* files are displayed in the **Navigator** view. For example:

The *build.xml* file is displayed in the editor view. For example:

8 Refine the parameters for the testsuite Ant task as desired.

Define the testsuite Ant Task

This section describes the parameters for the testsuite Ant task in the generated *build.xml* file. The following topics are covered:

- Description
- Parameters
- Parameters Specified as Nested Elements

Description

Represents the set of Natural unit tests to be run.

It is assumed that all necessary resources to run the tests are contained within a NaturalONE project. To run subprogram tests, a local copy of the subprogram file (*.nsn file*) must be in the correct Natural Library folder. To run business service tests, the folder must contain the domain file, steplib file associated with the domain, and all subprogram file(s) referenced by the business service.

Each testsuite contains a connection node that defines how the tests will connect the Natural server.

There are three ways to run Natural unit tests:

- Create the units tests in NaturalONE using one of the Unit test wizards and then add a fileset subnode that will load the generated .bsrvtst, .exttst, or .nattst files
- Add a subprogram node to test a specific subprogram
- Add a businessService node to test a specific business service

Parameters

Attribute	Description	Required
failureProperty	Name of the Ant property that will be set to "true" when one or more unit tests fail.	No
haltOnFailure	Value indicating whether to halt the Ant script by throwing an Ant build exception upon receiving the first unit test failure. Valid values are "true" (halt the Ant script upon first failure) or "false" (run all unit tests regardless of failure). By default, this option is false.	No
logtests	Value indicating whether to log and save test history to the Testing-History folder. Valid values are "true" (save test history) or "false" (do not save test history). By default, this option is false.	No
name	Name used by the testsuite for output information in the test logs and Ant build log.	No

Attribute	Description	Required
setProjectSteplibs	Value indicating whether the steplibs from the Natural project are set in the RPC server environment.	No
	must always be accessible when the value is 0N (or when this property is not specified at all). The Natural Development Server is accessed to check the development mode settings for the steplib consolidation. These steplibs are then passed to the RPC server. In order to be compatible with older <i>build.xml</i> files, the default value is 0N when not specified.	

Parameters Specified as Nested Elements

This section describes parameters that are specified as nested elements. The following topics are covered:

- connection
- fileset
- subprogram
- businessService
- input
- validate

connection

Defines the connection settings to use to communicate with the Natural server.

Parameters:

Attribute	Description	Required
address	Broker address (when a broker ID is specified).	Mandatory when brokerID is used
brokerID	Broker ID for the connection.	Either brokerID or environmentName
environmentName	Name of an EntireX RPC connection configured in Eclipse.	Either environmentName or brokerID
logon	Whether a Natural logon is required.	Optional and only when brokerID is used
password	Password for the connection.	No
rpcUserID	RPC user ID for the connection.	Optional (used with secured Natural environments)
rpcPassword	RPC password for the connection.	Optional (used with secured Natural environments)
userID	User ID for the connection.	Mandatory when brokerID is used

fileset

Runs a set of unit test files.

Parameters:

Attribute	Description	Required
dir	Name of the folder/project containing the unit test files.	Yes

Parameters specified as nested elements:

Parameter	Description
include name	Name of the unit test(s) to run. For example, include name="**/*.bsrvtst" / will run
	all business service unit tests in the specified folder/project.

subprogram

Runs a single test against a subprogram.

Parameters:

Attribute	Description	Required
project	Name of the Eclipse Natural project containing the subprogram.	Yes
library	Natural library containing the subprogram.	Yes
name	Name of the subprogram to execute, excluding the file extension (.NSN).	Yes

Parameters specified as nested elements:

Parameter	Description
input	See <i>input</i> .
validate	See <i>validate</i> .

businessService

Runs a single test against a business service.

Parameters:

Attribute	Description	Required
project	Name of the Eclipse Natural project containing the business service.	Yes
domain	Name of the domain containing the business service.	Yes
name	Name of the business service to run.	Yes
version	Version of the business service to run.	Yes
method	Name of the method to test.	Yes

Parameters specified as nested elements:

Parameter	Description
input	See <i>input</i> .
validate	See <i>validate</i> .

input

Specifies the value for a field to be used for input.

Parameters:

Attribute	Description	Required
name	Fully qualified field name in the format: [level one].[name]	Yes
value	Value to assign to the field.	Yes

validate

Specifies the field to be validated when it is returned by the call to the server.

Parameters:

Attribute	Description	Required
name	Fully qualified field name in the format:	
	[level one].[name]	
type	Type of validator to use (see the following table).	Yes
value	Value to assign to the field.	Yes

Validators:

Туре	Description
BooleanValidator	Validates Boolean values. True values are: x, t , true, or 1.
ByteValidator	Compares an array of bytes.
ComparisonValidator	Compares values based on mathematical expressions (for example, ">", "<", "=", "<=", ">=").
DateValidator	Compares dates. The value is in the format: MON DD, YYYY (where MON is a 3-character abbreviation for a month name).
DecimalValidator	Compares decimal values.
IntegerValidator	Compares integer values. Decimals will be truncated.
RegexValidator	Verifies that the value in the field matches a regular expression.
StringValidator	Compares the value in the field against a string.
TimeValidator	Compares the value in the field against a time. Time is in the format: MMM d, yyyy hh:mm:ss.SSS.
