## Preface

---

This documentation is organized under the following headings:

<b>Introduction</b>	What is the Natural Web I/O Interface?
<b>Installing and Configuring the Natural Web I/O Interface Server</b>	How to install and configure the Natural Web I/O Interface server in a Windows environment.
<b>Installing the Natural Web I/O Interface Client</b>	How to install the Natural Web I/O Interface client on an application server or in a servlet container so that it can be used with the Natural Web I/O Interface server.
<b>Configuring and Administering Clients</b>	How to define the information that is to appear in the logon page.

**Note:** This documentation only explains how to install the Natural Web I/O Interface server in a Windows environment. For information on how to install it in a mainframe or Linux environment, see the Natural documentation for the appropriate platform.

# 1

## About this Documentation

---

■ Document Conventions .....	2
■ Online Information and Support .....	2
■ Data Protection .....	3

## Document Conventions

---

Convention	Description
<b>Bold</b>	Identifies elements on a screen.
Monospace font	Identifies service names and locations in the format <i>folder.subfolder.service</i> , APIs, Java classes, methods, properties.
<i>Italic</i>	Identifies:  Variables for which you must supply values specific to your own situation or environment. New terms the first time they occur in the text. References to other documentation sources.
Monospace font	Identifies:  Text you must type in. Messages displayed by the system. Program code.
{ }	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the   symbol.
[ ]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [ ] symbols.
...	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...).

## Online Information and Support

---

### Product Documentation

You can find the product documentation on our documentation website at <https://documentation.softwareag.com>.

### Product Training

You can find helpful product training material on our Learning Portal at <https://learn.software-ag.com>.

### Tech Community

You can collaborate with Software GmbH experts on our Tech Community website at <https://tech-community.softwareag.com>. From here you can, for example:

- Browse through our vast knowledge base.
- Ask questions and find answers in our discussion forums.
- Get the latest Software GmbH news and announcements.
- Explore our communities.
- Go to our public GitHub and Docker repositories at <https://github.com/softwareag> and <https://hub.docker.com/publishers/softwareag> and discover additional Software GmbH resources.

## Product Support

Support for Software GmbH products is provided to licensed customers via our Empower Portal at <https://empower.softwareag.com>. Many services on this portal require that you have an account. If you do not yet have one, you can request it at <https://empower.softwareag.com/register>. Once you have an account, you can, for example:

- Download products, updates and fixes.
- Search the Knowledge Center for technical information and tips.
- Subscribe to early warnings and critical alerts.
- Open and update support incidents.
- Add product feature requests.

## Data Protection

---

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

# I Introduction

---

## 2 Introduction

---

■ What is the Natural Web I/O Interface? .....	8
■ Components of the Natural Web I/O Interface .....	8
■ Executing a Natural Application in a Web Browser .....	9
■ Client-Server Compatibility .....	10
■ Terminology .....	10
■ Differences in a SPoD Development Environment .....	11
■ Restrictions When Using the Natural Web I/O Interface with Natural Applications .....	11
■ Differences between the Natural Web I/O Interface Client and Terminal Emulation .....	13

This chapter describes the purpose and the functions of the Natural Web I/O Interface.

**Note:** This introduction mainly describes how the Natural Web I/O Interface works in a runtime (production) environment. The section [Differences in a SPoD Development Environment](#) briefly explains the special version that is used in a SPoD development environment.

## What is the Natural Web I/O Interface?

---

The Natural Web I/O Interface is used to execute Natural applications in a web browser. It fully supports the following:

- The display and input of Unicode characters. See *Unicode Input/Output Handling in Natural Applications* in the *Unicode and Code Page Support* documentation.
- Rich internet applications developed with Natural for Ajax.

## Components of the Natural Web I/O Interface

---

The Natural Web I/O Interface consists of a server and a client.

### Server

The Natural Web I/O Interface server enables you to use a browser as the I/O device for Natural applications. The server does the user authentication, creates the Natural session and handles the I/O between Natural and the client. The Natural Web I/O Interface server is installed on the same machine as the Natural application.

### Client

The client handles the communication between the user's web browser and the Natural Web I/O Interface server. It converts the output from the Natural application to web pages, and returns the user input to Natural.

Two types of client are supported:

- Natural Web I/O Interface client for displaying character-based applications in the web browser. Maps with GUI controls are not supported in this case.
- Natural for Ajax for displaying rich internet applications in the web browser. For further information on this type of client, see the Natural for Ajax documentation.

The client is installed on a web/application server. This can be done on any machine in the network.

## Executing a Natural Application in a Web Browser

The Natural Web I/O Interface receives data from a Natural application and delivers web pages to the user's web browser. This is illustrated in the following graphic:

The communication steps for executing a Natural application in the web browser are:

1. The user enters the address (URL) of a logon page in the web browser. The client then displays the logon page in the web browser.

**Note:** For information on how to invoke and configure the logon page, see *Configuring the Client*.

2. The user enters all required information for starting a Natural application into the logon page. This information is sent to the client.
3. The client asks the Natural Web I/O Interface server to start the requested Natural application for this user.
4. The Natural Web I/O Interface server checks the supplied user ID and password, creates a Natural session for the user and starts the Natural application.

5. The Natural application returns the first application screen which is then transferred via the Natural Web I/O Interface server to the client and finally as a web page to the web browser.

Different web browsers are supported. Note that cookies and JavaScript must be enabled in the web browser. For a list of the currently supported web browsers, see the browser prerequisites for the type of client that you are using.

## Client-Server Compatibility

---

The following rules apply:

- The Natural Web I/O Interface server can work with any client that has the same or a higher protocol version.

If the server detects that the client is using a version that is lower than the server version, the server replies that the client is too old and the connection is closed.

- The client can work with any server that has the same or a lower protocol version.

If the client detects that the server is using a version that is lower than the client version, the client switches to the server version. However, new client functionality is not supported in this case.

- The Natural Web I/O Interface server must have the same protocol version as the Natural process that is started by the server. If Natural detects that the server is using a different protocol version, an error message is sent to the user and the connection is closed.

## Terminology

---

On the different Natural platforms for which the Natural Web I/O Interface is supported, different techniques are used for implementing the server part of the Natural Web I/O Interface. On Natural for Linux, it is implemented as a daemon. On Natural for Windows, it is implemented as a service. On the mainframe, it is implemented as a server. In this documentation, the general term “server” is therefore used for all different kinds of implementation.

## Differences in a SPoD Development Environment

---

The previous sections of this introduction have described how the Natural Web I/O Interface works in a runtime (production) environment. This section briefly explains the differences in a SPoD development environment.

A special version of the Natural Web I/O Interface is used when working in a remote development environment with Natural for Windows (SPoD). In this case, the Natural Web I/O Interface is an integrated component which does not require a separate installation. The server is part of the Natural Development Server (NDV), and the client is part of Natural Studio. Other than in the runtime environment, the screen is not displayed in a browser but in a normal window. Rich GUI pages created by Natural for Ajax are not supported in the development environment.

It is important that I/O via the Natural Web I/O Interface has been enabled on the Natural host. Otherwise, the Natural Web I/O Interface cannot be invoked. See also *Unicode Input/Output Handling in Natural Applications* in the *Unicode and Code Page Support* documentation.

## Restrictions When Using the Natural Web I/O Interface with Natural Applications

---

There are several restrictions when using the Natural Web I/O Interface with Natural applications on Linux, mainframe or Windows hosts.

**Note:** The term “application” refers to application software. It does not refer to system software or software for development.

The following restrictions apply:

- **GUI controls**

GUI controls are not supported: dialogs, buttons, radio buttons, list boxes, list views, check boxes etc. The Natural Web I/O Interface only supports Natural applications developed without GUI controls.

- **File transfer**

File transfer (for example, with the `DOWNLOAD` statement) is not supported by the Natural Web I/O Interface.

- **Runtime errors**

This restriction applies to older Natural versions on Linux and Windows. As of version 6.3.3, this restriction no longer applies.

Runtime errors in Natural applications are not handled by the Natural Web I/O Interface. This leads to a loss of the session. Bypass: use the Natural system variable \*ERROR-TA to handle the error.

```
DEFINE DATA
LOCAL
1 ERR_INFO
  2 ERR_NR(N5)
  2 ERR_LINE(N4)
  2 ERR_STAT(A1)
  2 ERR_PNAM(A8)
  2 ERR_LEVEL(N2)
END-DEFINE
INPUT ERR_INFO
DISPLAY ERR_INFO
TERMINATE
END
```

#### ■ **Terminal commands**

Terminal commands are not supported. They do not work when entered in the Natural Web I/O Interface client.

#### ■ **Natural system variable \*INIT-ID**

When using the Natural Web I/O Interface client with Natural applications on Linux, mainframe or Windows hosts, the Natural system variable \*INIT-ID will not be filled with a value for the terminal type. On Linux and Windows, it will contain the value "notty". On mainframes, it will contain a session ID that is unique on that server.

The following restrictions apply to Natural on Linux and Windows hosts (the mainframe does not have these restrictions):

#### ■ **Return to the Natural main screen**

You must not use Natural applications that return to the Natural main screen as this leads to wrong screen display and a loss of the session.

#### ■ **Natural editors and utilities**

You must not use Natural utilities such as SYSMAIN or SYSDDM and editors such as the program editor as this leads to wrong screen display and a loss of the session.

#### ■ **Natural system commands**

You must not use any Natural system command such as CATALL, FIND, GLOBALS, HELP, KEY, LIST, RETURN, SCAN, SETUP or XREF as this leads to wrong screen display and a loss of the session.

## Differences between the Natural Web I/O Interface Client and Terminal Emulation

---

The Natural Web I/O Interface client runs as an HTML terminal emulator inside a browser control. The look and feel of the Natural Web I/O Interface client display is quite similar to that of the regular terminal (emulation), but there are some differences due to browser functionality:

- A double-click with the mouse pointer on any field simulates the ENTER key.
- It is not possible to position the cursor outside the range of input and output fields.
- The cursor can be moved with the left and right arrow keys within one input field. It is also possible to jump from one input field to another using the left, right, up and down arrow keys.
- The insert mode can be switched on and off using the INSERT key.
- For Unicode character sets (type U; for example, Chinese), one character may require more space than an ordinary alphanumeric character, because the Unicode character representation is proportional. The application design must take this into account, because Natural is based on characters with fixed width. For input fields it is possible to scroll within the field, but for output fields there may not be sufficient space to display the Unicode characters. The display length for a field can be controlled by the session parameter DL.
- Type-ahead mode is not supported.
- Paste in overwrite mode is not supported.
- Key schemes are fixed; keys such as the right CTRL key and the ENTER key on the numeric pad are no longer definable.
- Screen update is slower since the complete screen is sent rather than updates.
- The blink attribute is not supported in Internet Explorer.
- The keys PF1 through PF12 are simulated by the key combinations F1 through F12.
- The keys PF13 through PF24 are simulated by the key combinations SHIFT+F1 through SHIFT+F12.
- The keys PF25 through PF36 are simulated by the key combinations CTRL+F1 through CTRL+F12.
- The keys PF37 through PF48 are simulated by the key combinations ALT+F1 through ALT+F12.
- The program attention keys (PA1, PA2 and PA3) are simulated by the key combinations CTRL+SHIFT+F1, CTRL+SHIFT+F2, CTRL+SHIFT+F3.
- The clear key is simulated by CTRL+SHIFT+F4.

### IBM Mainframes Only

- The terminal screen size is controlled by the Natural profile parameter TMODEL. The default setting TMODEL=0 means 24 lines and 80 columns.
- There is no ATTN (attention interrupt) key, no RESET key and no EEOF (erase end of file) key.

### **VT Only**

The I/O occurs in block mode. Therefore, the Natural program will only react when a function key is pressed.

## **II**      Installing and Configuring the Natural Web I/O Interface **Server**

---

# 3 Installing and Configuring the Natural Web I/O Interface

## Server

---

■ Installing the Natural Web I/O Interface Service .....	18
■ Configuring the Natural Web I/O Interface Service on Windows .....	18
■ Logging Information .....	22
■ SSL Support .....	23

On Windows, the server part of the Natural Web I/O Interface runs in the background as a so-called service.

## Installing the Natural Web I/O Interface Service

---

The Natural Web I/O Interface service is installed with Natural for Windows if the corresponding option is set during the installation. See the *Installation* documentation for further information.

## Configuring the Natural Web I/O Interface Service on Windows

---

The Natural Web I/O Interface service is installed as a Windows service. In the Windows Services management console, the service is listed as **Software AG Natural *n.n* Web I/O Service**. It is started automatically at Windows startup. By default, the service listens on the port number 2900. You can choose a different port number during installation.

The configuration of the Natural Web I/O Interface service is stored in the Windows registry. If you do not want to use the default values with which the Natural Web I/O Interface service has been installed, you can modify the service configuration as described below to meet your requirements.

The following topics are covered below:

- [Natural Web I/O Interface Service Commands](#)
- [Example: Starting Natural Web I/O Interface Service with Your Own Configuration](#)
- [Batch File for Starting Natural](#)
- [Environment Variables](#)

### Natural Web I/O Interface Service Commands

The program *nwosvcd.exe*, which is stored in the Natural *bin* directory, is used to execute the service commands. The following service commands can be specified in the **Command Prompt** window of Windows:

Command	Description
<code>nwosvcd -help</code>	Shows all available Natural Web I/O Interface service commands and subcommands in a message box.
<code>nwosvcd -install</code>	Installs the Natural Web I/O Interface service.  The service is installed with the startup type <b>Automatic</b> .

Command	Description
	If you want to change the startup type, you must open the Windows Services management console. Open the properties for <b>Software AG Natural <i>n.n</i> Web I/O Service</b> and select the desired startup type.
<code>nwosvcd -start</code>	Starts the Natural Web I/O Interface service from the system.
<code>nwosvcd -stop</code>	Stops the Natural Web I/O Interface service from the system.
<code>nwosvcd -remove</code>	Removes the Natural Web I/O Interface service from the system.
<code>nwosvcd -console</code>	<p>Runs the Natural Web I/O Interface service as a Windows console application. In this case, an icon appears in the notification area of the taskbar. When you invoke the context menu for this icon, the following commands are provided:</p> <ul style="list-style-type: none"> <li>■ <b>About</b> Shows the version of the Natural Web I/O Interface service.</li> <li>■ <b>Exit</b> Invokes a dialog box, asking whether you want to stop the Natural Web I/O Interface service or not.</li> </ul>
<code>nwosvcd -show</code>	Shows the configuration of the Natural Web I/O Interface service.
<code>nwosvcd -config keys</code>	<p>Changes the configuration of the Natural Web I/O Interface service. The following keys can be specified:</p> <ul style="list-style-type: none"> <li><code>-host=hostname</code> The host name used.</li> <li><code>-port=nnnn</code> The port number.</li> <li><code>-logging=option</code> The amount of logging information that is to be reported. One of the following options can be specified:   E for errors.  W for warnings.  I for information.   See also <a href="#">Logging Information</a>.</li> <li><code>-ssl=[yes no]</code> Defines whether the SSL protocol is to be used. See also <a href="#">SSL Support</a>.</li> </ul>

**Note:** The service commands are not case-sensitive. They can be specified in both upper-case and lower-case.

### Example: Starting Natural Web I/O Interface Service with Your Own Configuration

This example explains how to create a new configuration with the port number 3344.

#### ➤ To start the Natural Web I/O Interface service with your own configuration

- 1 Open the Windows Services management console and stop the Natural Web I/O Interface service.
- 2 Invoke the **Command Prompt** window of Windows.
- 3 Go to the Natural *bin* directory which contains the file *nwosvcd.exe*.
- 4 Enter the following command to configure a new port number

```
nwosvcd -config -port=3344
```

- 5 Go back to the Windows Services management console and start the Natural Web I/O Interface service.

### Batch File for Starting Natural

In order to start a Natural session, the Natural Web I/O Interface service executes a batch file. The batch file prepares the environment for the Natural session and eventually starts Natural. It must therefore contain all environment settings needed to run the Natural session.

The batch file receives certain parameters from the Natural Web I/O Interface client. The parameters can either be evaluated by the batch file itself or passed on to Natural. A client who wants to start a Natural session can specify the batch file to be used. The section [Configuring the Client](#) describes where and how this is done.

A sample batch file with the name *nwo.bat* is contained in the Natural *bin* directory. It has the following content:

```
@echo off
set IPAddress=""
set ClientID=""
set Argument3=""
set Argument4=""
set NaturalParameters=""

if not (%1)==(null) set IPAddress=%~1
if not (%2)==(null) set ClientID=%~2
if not (%3)==(null) set Argument3=%~3
if not (%4)==(null) set Argument4=%~4
if not (%5)==(null) set NaturalParameters=%~5
```

```

echo IPAddress=%IPAddress% >nwo.log
echo ClientID=%ClientID% >>nwo.log
echo Argument3=%Argument3% >>nwo.log
echo Argument4=%Argument4% >>nwo.log
echo NaturalParameters=%NaturalParameters% >>nwo.log

natrt.exe %NaturalParameters% etid=$$

```

You can create your own batch files to start up Natural sessions. If you do so, you should make sure - as in the above sample batch file - to start Natural with *natrt.exe*. The above sample requires that the batch file is contained in the Natural *bin* directory. If this is not the case, you must specify an appropriate absolute or relative path to *natrt.exe*.

In order to refer to a specific batch file in the Natural Web I/O Interface client, you can specify either an absolute path or a relative path. If you specify a relative path, the batch file is searched according to the following rules:

1. In the directory where *nwosvcd.exe* is located. This is the Natural *bin* directory.
2. In the system directory. This is the directory that the system function `GetSystemDirectory` would deliver.
3. In the Windows directory. This is the directory that the system function `GetWindowsDirectory` would deliver.
4. In the directories that are listed in the `PATH` environment variable.

## Arguments

The batch file will receive the following arguments:

Order	Argument	Description
1	IPAddress	The client IP address from where the session is opened.  <b>Note:</b> If there is a proxy, this will not be the IP address of the client workstation. Instead, it will be the IP address of the proxy.
2	ClientId	The user name from the logon page is passed as the client ID.
3	Argument3	Reserved for future use.
4	Argument4	Reserved for future use.
5	NaturalParameters	These can be any Natural parameters. The parameters are either defined in the configuration file for the session, or they are entered in the logon page. The following is an example of the corresponding entry in the configuration file:  <natural_parameter>parm=nwoparm\ stack=(logon\ mylib;start-program;fin)<natural_parameter>

Order	Argument	Description
		The language that is selected in the logon page is added as the first element to the Natural parameters in the form "ulang=x".

Arguments 1 and 2 can be used to audit the client, to allow to run an application from a specific PC (identifying the IP address), to build statistics, to do special actions, etc.

## Environment Variables

In the batch file, several environment variables can be set for the Natural session that is started by the service:

**NWO\_ENABLE\_ACK**=["YES"|"NO"]

This environment variable is used for asynchronous screens (SET CONTROL N).

YES When asynchronous screens are sent to the client, Natural will wait to receive an ACK package before the next screen can be sent.

NO No waiting between asynchronous screens. Default value.

**NWO\_TIMEOUT**=[*number-of-seconds*]

The maximum time, in seconds, that Natural waits to receive any input from the client before it closes the session. If the number of seconds is "0", Natural waits infinitely (no timeout). The default value is "0".

Error NAT5466 is returned at timeout. In Natural, the application can handle this error and decide how to continue or terminate.

## Logging Information

---

The logging information system reports errors, warnings and/or session information, depending on the option that has been defined with the following [Natural Web I/O Interface service command](#):

```
nwosvcd -config -logging=option
```

*option* can be one of the following:

Option	Description
E	Error.  When this option is specified, the Natural Web I/O Interface service reports only errors.  In the case of an error, the service usually exits immediately.
W	Warning.

Option	Description
	When this option is specified, the Natural Web I/O Interface service reports errors and warnings for uncritical errors.  In the case of a warning, the service continues to run.
I	Information.  When this option is specified, the Natural Web I/O Interface service reports errors, warnings and information.  The information messages allow to check the session parameters, IP address, etc.

Help information, for example, on how to run, configure and install the Natural Web I/O Interface service is always provided. The messages which inform you when the service has been started or stopped are also part of the help information.

To find out which logging option is currently active, enter the following Natural Web I/O Interface service command:

```
nwosvcd -show
```

The logging messages are saved in the Windows Event Viewer.

## SSL Support

SSL is used for a secure connection between the Natural Web I/O Interface server and the Natural Web I/O Interface client or Natural for Ajax. Server authentication cannot be switched off. A certificate and a private key is always required on the server.

To establish an SSL connection, you have to proceed as described in the following topics:

- [Creating an SSL Certificate and a Private Key](#)
- [Configuring the Service](#)
- [Configuring the Client](#)

### Creating an SSL Certificate and a Private Key

To create and use an SSL certificate and a private key on the server, proceed as described below.

1. Adapt the example configuration file *openssl.cnf* to your needs.

**Note:** *openssl.cnf* is delivered in *<install-dir>\common\security\openssl* and *openssl* is delivered in *<install-dir>\common\security\openssl\bin*.

2. Set the environment variable so that it points to the file *openssl.cnf*:

```
set OPENSSL_CONF=<install-dir>\common\security\openssl\openssl.cnf
```

### 3. Generate a certificate signing request:

```
openssl req -new > server.cert.csr
```

### 4. Generate a private RSA key:

```
openssl rsa -in privkey.pem -out server.cert.key
```

### 5. Generate a self-signed certificate:

```
openssl x509 -in server.cert.csr -out server.cert.crt -req -signkey ↵  
server.cert.key -days 365
```

It is important that the name of the generated certificate is *server.cert.crt* and that the name of the generated private key is *server.cert.key*.

**Note:** The certificate can be self-signed or it can be signed by a CA (Certificate Authority) such as VeriSign.

### 6. Put the generated files into the same directory as the scripts which start the Natural Web I/O Interface server.

## Configuring the Service

After you have created an SSL certificate and a private key as described above, proceed as follows:

### 1. Change the configuration of the Natural Web I/O Interface service using the following command:

```
nwosvcd -config -ssl=yes
```

### 2. Restart the Natural Web I/O Interface service.

See also [Configuring the Natural Web I/O Interface Service on Windows](#).

## Configuring the Client

After you have configured the service as described above, you have to import the generated *server.cert.crt* file to a truststore on the client. For information on how to do this for the Natural Web I/O Interface client, see [Configuring SSL](#). If you are using Natural for Ajax as the client, see [Configuring SSL](#) in the Natural for Ajax documentation.

# III

## Installing the Natural Web I/O Interface Client

---

This part explains how to install the Natural Web I/O Interface client on Tomcat so that it can be used with the server part of the Natural Web I/O Interface that is running in a Natural for z/OS, Natural for Linux or Natural for Windows runtime environment.

The following topics are covered:

### [Prerequisites](#)

### [Installing the Natural Web I/O Interface Client on Apache Tomcat](#)

### [Migrating the Natural Web I/O Interface Client from IIS to Apache Tomcat](#)

# 4

## Prerequisites

---

■ Servlet Container .....	28
■ Natural for z/OS .....	28
■ Natural for Linux .....	28
■ Natural for Windows .....	29
■ Browser Prerequisites .....	29

## Servlet Container

---

The following servlet container is supported. The servlet container is not delivered with the Natural Web I/O Interface. It can be obtained from the location indicated below, according to its license terms.

- Apache Tomcat 9 and 10 (see <http://tomcat.apache.org/>).

## Natural for z/OS

---

If you want to use the Natural Web I/O Interface client with Natural for z/OS, the following must be installed:

- Natural for z/OS Version 8.2.5 or above, and
- the Natural Web I/O Interface server.

For detailed information, see:

- the *Installation* documentation for the different operating systems which is provided for Natural for z/OS;
- the section *Installing and Configuring the Natural Web I/O Interface Server* in the version of this *Natural Web I/O Interface* documentation which is provided for Natural for z/OS.

## Natural for Linux

---

If you want to use the Natural Web I/O Interface client with Natural for Linux and Cloud, the following must be installed:

- Natural on Linux and Cloud Version 9.2.1 or above, and
- the Natural Web I/O Interface server and daemon.

For detailed information, see:

- the *Installation* documentation which is provided for Natural for Linux;
- the section *Installing and Configuring the Natural Web I/O Interface Server* in the version of this *Natural Web I/O Interface* documentation which is provided for Natural for Linux.

## Natural for Windows

---

If you want to use the Natural Web I/O Interface client with Natural for Windows, the following must be installed:

- Natural for Windows Version 9.2.1 or above, and
- the Natural Web I/O Interface server and service.

For detailed information, see:

- the *Installation* documentation which is provided for Natural for Windows;
- the section [Installing and Configuring the Natural Web I/O Interface Server](#) in the version of this *Natural Web I/O Interface* documentation which is provided for Natural for Windows.

## Browser Prerequisites

---

Supported browsers in this version are:

Microsoft Edge (Chromium)

Mozilla Firefox Extended Support Release 115<sup>(1)</sup>

Google Chrome <sup>(2)</sup>

### Notes:

<sup>(1)</sup> Only the Extended Support Releases of Mozilla Firefox are explicitly supported. Due to frequent upgrades of the Mozilla Firefox consumer release, the compatibility of Natural Web I/O Interface client with future versions of Mozilla Firefox cannot be fully guaranteed. Possible incompatibilities will be removed during the regular maintenance process of Natural Web I/O Interface client.

<sup>(2)</sup> The Google Chrome support is based on Google Chrome Version 127. Due to frequent version upgrades of Google Chrome, compatibility of Natural Web I/O Interface client with future versions of Google Chrome cannot be fully guaranteed. Possible incompatibilities will be removed during the regular maintenance process of Natural Web I/O Interface client.

**Important:** Cookies and JavaScript must be enabled in the browser.

# 5      Installing the Natural Web I/O Interface Client on Apache

## Tomcat

---

■ Installation Steps .....	32
■ Installation Verification .....	33

If you want to use the Natural Web I/O Interface client with Apache Tomcat, you must proceed as described in this chapter.

## Installation Steps

---

The Natural Web I/O Interface client is installed using the Tomcat Manager.

The following is assumed:

- `<install-dir>` is the path to Software AG's main installation directory. By default, this is `C:\SoftwareAG` on Windows and `/opt/softwareag` on Linux.
- `<host>` is the name of the machine on which Apache Tomcat is installed.
- `<port>` is the name of the port where Apache Tomcat is installed. In a default installation, this is port 8080.
- `<tomcat>` is the path to the directory in which Apache Tomcat is installed.

The following topics are covered below:

- [First-time Installation](#)
- [Update Installation](#)

### First-time Installation

#### ➤ To install the Natural Web I/O Interface client

- 1 Natural for Windows and Linux: Copy the complete contents of the `<install-dir>/natural/INSTALL/nwoclient/tomcat` directory to a directory of your choice on your hard disk.
- 2 Make sure that Apache Tomcat is running.
- 3 Open your web browser and enter the following URL:

```
http://<host>:<port>/manager/html
```

This opens the Tomcat Manager.

- 4 Deploy the web application file `natuniweb.war`:
  - Under **Select WAR file to upload** select the path to the file `natuniweb.war`.
  - Choose **Deploy**.
- 5 In the Tomcat Manager, look for the application **Natural Web I/O Interface Client** and choose **Reload**.

## Update Installation

### ➤ To update the Natural Web I/O Interface client

- 1 Natural for Windows and Linux: Copy the complete contents of the `<install-dir>/natural/INSTALL/nwoclient/tomcat` directory to a directory of your choice on your hard disk.

Or:

Download the Natural Web I/O Interface client for Apache Tomcat from Empower (<https://empower.softwareag.com/>) and unzip the contents to a directory of your choice on your hard disk.

- 2 Shut down Apache Tomcat.
- 3 Create a backup copy of your `sessions.xml` file, which is located in `<tomcat>/webapps/natuniweb/WEB-INF`.
- 4 Start Apache Tomcat.
- 5 Open your web browser and enter the following URL:

```
http://<host>:<port>/manager/html
```

This opens the Tomcat Manager.

- 6 Select `natuniweb.war` in the list of installed applications.
- 7 Choose **Undeploy**.
- 8 Deploy the new version of the Natural Web I/O Interface client as in a first-time installation.
- 9 Restore the `sessions.xml` file that you have backed up previously.

## Installation Verification

---

It is assumed that `http://<host>:<port>` is the URL of your application server.

To verify the installation, enter the following URL in your web browser:

```
http://<host>:<port>/natuniweb/natural.jsp
```

For example:

```
http://myhost:8080/natuniweb/natural.jsp
```

The Natural Web I/O Interface client is now started in your browser. The entries which appear in the resulting logon page depend on the settings in your configuration file. For further information, see [Configuring the Client](#).

# 6 Migrating the Natural Web I/O Interface Client from IIS to Apache Tomcat

---

■ Before You Install the Natural Web I/O Interface Client .....	36
■ Installing the Natural Web I/O Interface Client on Apache Tomcat .....	37
■ Configuring the Natural Web I/O Interface Client on Apache Tomcat .....	37

Microsoft Internet Information Services (IIS) is no longer supported. If you are currently using the Natural Web I/O Interface client on IIS, you have to move to Apache Tomcat.

**Note:** JBoss Application Server and Oracle GlassFish Server are also no longer supported. If you are currently using one of these application servers, you also have to move to Apache Tomcat. In this case, however, you can reuse your previous settings (that is, the URL for logon page and the configuration file *sessions.xml*).

The most simple solution is to migrate the Natural Web I/O Interface client from IIS to Apache Tomcat. Therefore, this chapter gives IIS administrators a quick introduction to a Tomcat installation and describes the migration steps.

## Before You Install the Natural Web I/O Interface Client

---

If Apache Tomcat is not yet installed, proceed as described in the topics below:

- [Installing Tomcat](#)
- [Installing Java](#)
- [Starting the Tomcat Server](#)

### Installing Tomcat

Go to <http://tomcat.apache.org/> and download Tomcat as a zip file.

For Microsoft Windows users: download either the 32-bit or the 64-bit Windows zip file.

Unzip the downloaded zip file to a directory of your choice.

### Installing Java

Tomcat is based on Java. Therefore, you have to make sure that a Java Runtime Environment (JRE) or a Java Development Kit (JDK) is installed. The version of the Java runtime should be at least Java 6 update 24. This is the minimum version that is required for the Natural Web I/O Interface client on Tomcat.

You can download the Java JRE or JDK from the Oracle website at <http://www.oracle.com/technetwork/java/javase/downloads/index.html>.

If Java is installed on your system, make sure that the environment variable `JAVA_HOME` is set to the Java home directory.

## Starting the Tomcat Server

When Tomcat and the appropriate Java version have been installed, you can start Tomcat.

To start Tomcat, execute the *startup.bat* file from the *bin* directory of your Tomcat installation. To check whether Tomcat is running, enter the following URL:

```
http://localhost:8080
```

This should display Tomcat's default home page.

## Installing the Natural Web I/O Interface Client on Apache Tomcat

---

When Apache Tomcat has been installed, install the Natural Web I/O Interface client as described in [Installing the Natural Web I/O Interface Client on Apache Tomcat](#).

## Configuring the Natural Web I/O Interface Client on Apache Tomcat

---

When the Natural Web I/O Interface client has been installed, proceed as described in the topics below:

- [Invoking the Logon Page](#)
- [Changing the Tomcat HTTP Port](#)
- [Using the Settings from Your IIS Configuration File](#)
- [Using the Configuration Tool](#)
- [Protecting the Configuration Tool Against Unauthorized Access](#)
- [Displaying the Logon Page by Default](#)

### Invoking the Logon Page

Enter the following URL to invoke the logon page (this is different from the URL that was used with IIS):

```
http://localhost:8080/natuniweb/natural.jsp
```

## Changing the Tomcat HTTP Port

IIS usually runs on the default port 80. If you want Tomcat to work with the same port, edit the file *server.xml* which is located in Tomcat's *conf* subdirectory and then search for the following text:

```
<Connector port="8080" protocol="HTTP/1.1"
```

Change the port number so that it looks as follows:

```
<Connector port="80" protocol="HTTP/1.1"
```

## Using the Settings from Your IIS Configuration File

With Tomcat, you can reuse the *settings.xml* configuration file of IIS, but you have to rename the file to *sessions.xml*. Proceed as follows:

1. Copy the *settings.xml* file from your IIS installation to the following directory of your Tomcat installation:  
*webapps/natuniweb/WEB-INF*
2. Either rename the *sessions.xml* file which comes with the Natural Web I/O Interface client installation on Tomcat (for example, to *sessions-original.xml*) or delete it.
3. Rename the *settings.xml* file to *sessions.xml*.

## Using the Configuration Tool

When the Natural Web I/O Interface client runs on Tomcat, it is no longer necessary to edit the configuration file manually. Instead, you can use the configuration tool. Using this tool has the advantage that it is not possible for you to create invalid XML code and thus damage the XML file. See [Using the Configuration Tool](#) for further information.

The IIS-specific entries in the renamed configuration file will be ignored. These are:

```
natural_parameter visible  
theme  
screen top  
screen left  
screen size  
screen pfkeypos
```

You can still edit the configuration file manually. However, this is no longer recommended.

## Protecting the Configuration Tool Against Unauthorized Access

It is possible to protect the configuration tool against unauthorized access. See [Configuring Container-Managed Security](#) for detailed information.

For detailed information on the necessary realm configuration for Tomcat, see <http://tomcat.apache.org/tomcat-6.0-doc/realm-howto.html>.

## Displaying the Logon Page by Default

When you enter the URL `http://localhost:8080/natuniweb`, Tomcat shows the default page of the Natural Web I/O Interface client which allows you to access either the **logon page** or the **configuration tool** of the Natural Web I/O Interface client.

**Note:** If you have defined a different port (for example, 80), make sure to use that port number in the URL.

This behavior is different from IIS which displays the logon page by default. If you also want Tomcat to display the logon page by default, edit the file `web.xml` which is located in Tomcat's `webapps\natuniweb\WEB-INF` directory and search for the following entry:

```
<welcome-file-list>
  <welcome-file>
    index.html
  </welcome-file>
</welcome-file-list>
```

Change the name of the welcome file to `natural.jsp` as shown in the following example:

```
<welcome-file-list>
  <welcome-file>
    natural.jsp
  </welcome-file>
</welcome-file-list>
```

# IV

## Configuring the Client

---

This part explains how to configure the Natural Web I/O Interface client so that it can be used in a Natural runtime environment. The following topics are covered:

[About the Logon Page](#)

[Natural Client Configuration Tool](#)

[Natural Web I/O Style Sheets](#)

[Multi-Language Management](#)

[Starting a Natural Application with a URL](#)

[Configuring Container-Managed Security](#)

[Configuring SSL](#)

[Configuring Single Sign-On \(SSO\)](#)

[Logging](#)

# 7

## About the Logon Page

---

■ Starting a Natural Application from the Logon Page .....	44
■ Examples of Logon Pages .....	44
■ Dynamically Changing the CICS Transaction Name, Host Name, and Port Number when Starting a Session .....	45
■ Specifying a Password in the Logon Page .....	46
■ Changing the Password in the Logon Page .....	46
■ Browser Restrictions .....	47

## Starting a Natural Application from the Logon Page

---

When you start the Natural Web I/O Interface client in the browser, a logon page appears. The entries in this logon page depend on the settings in your [Session Configuration](#).

In order to start a Natural application from the logon page, you enter the following URL inside your browser:

```
http://<host>:<port>/natuniweb/natural.jsp
```

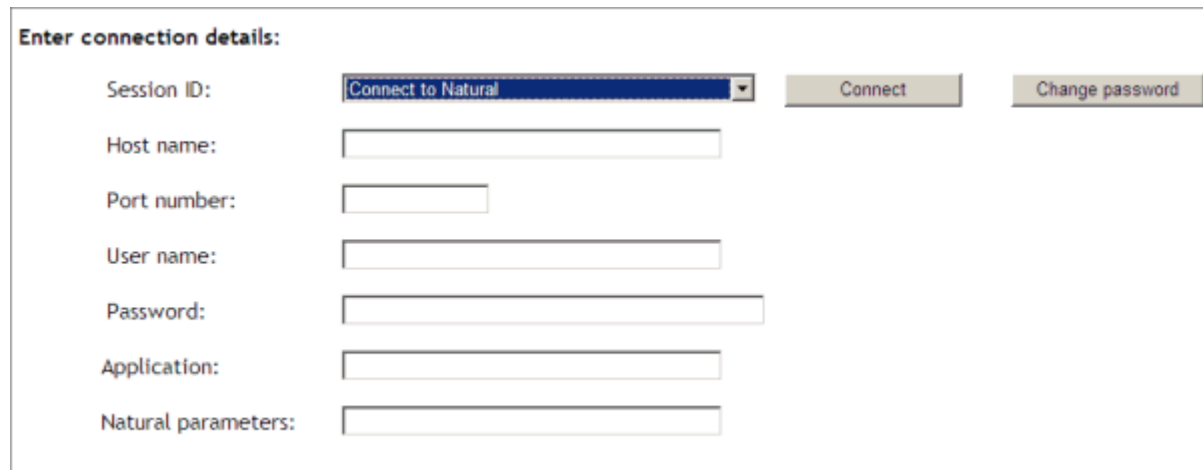

where *<host>* and *<port>* are the host name and port number of your application server.

## Examples of Logon Pages

---

For each session definition that has been configured in the configuration file, an entry appears on the logon page. If the user selects the corresponding entry, only those parameters that were not pre-configured in the configuration file need to be specified in the logon page in order to start the application. Usually, you will preconfigure all connection parameters except user name and password.

The following example shows part of a logon page which results from a configuration file in which no special entries are defined for a session:

Enter connection details:

Session ID: Connect to Natural Connect Change password

Host name:

Port number:

User name:

Password:

Application:

Natural parameters:

The following example shows part of a logon page which results from a configuration file in which many settings are already predefined (including user ID and password):

The screenshot shows a web form titled "Enter connection details:". Below the title, there is a label "Session ID:" followed by a dropdown menu. The dropdown menu currently displays "Demo Application (localhost 2900)". To the right of the dropdown menu is a button labeled "Connect".

To log on to a session, you have to specify all required information in the logon page (for example, you select a session from the corresponding drop-down list box). When you choose the **Connect** button, the screen for the selected session appears.

## Dynamically Changing the CICS Transaction Name, Host Name, and Port Number when Starting a Session

The following description applies if you want to switch to a different CICS transaction on a mainframe. It is also possible to select a different host and port number.

You specify the dynamic server parameters in the same text box in which you also specify the dynamic parameters for the Natural environment. So that the dynamic server parameters can be evaluated, it is important that you specify it before any Natural parameters, using the following syntax:

```
<TA_NAME=name TA_HOST=hostname TA_PORT=number>
```

### name

Can be 1 to 4 characters long. This must be the name of an existing CICS transaction which applies to a CICS Adapter. It will override the transaction name, currently defined in the configuration file for the CICS Adapter on the Natural Web I/O Interface server (NWO). Ask your administrator for further information.

### hostname

Can be 1 to 32 characters long. This must be the name, or the TCP/IP address of the host the desired CICS is running. It will override the hostname (RFE\_CICS\_TA\_HOST), currently defined in the configuration file for the CICS Adapter on the Natural Web I/O Interface server (NWO). Ask your administrator for further information.

### number

Can be a numeric value in the range from 1 to 65535. It is the TCP/IP port of the CICS-supplied listener. It will override the hostname (RFE\_CICS\_TA\_PORT), currently defined in the configuration file for the CICS Adapter on the Natural Web I/O Interface server (NWO). Ask your administrator for further information.

Make sure to put the entire definition in angle brackets. Dynamic server parameters can be separated by a comma or a blank character. Only the parameters to be overwritten must be specified. When this definition is followed by a Natural parameter, insert a blank before the Natural parameter.

### Example:

```
<TA_NAME=NA82 TA_HOST=HOST.LOCAL.NET TA_PORT=1898> STACK=(LOGON SYSCP)
```

If one of the dynamic server parameters is incorrect, an error message occurs, and the session cannot be started.

If an incorrect CICS transaction id is specified, the error message `EZY1315E 09/03/24 15:17:46 INVALID TRANID=G PARTNER INET ADDR=ip-address` occurs.

If an incorrect hostname or port number is specified, the error message `NAT9939 Open socket connection failed` occurs.

**Note:** The above definition of dynamic server parameters can also be specified in the configuration tool, in the same place where you also specify the Natural parameters, and together with the [URL parameter](#) `natparam`.

## Specifying a Password in the Logon Page

---

The following information applies when the field for entering a password appears on the logon page. This field does not appear when a password has already been defined in the configuration file.

Under Windows and Linux, you always have to enter the operating system password, even if Natural Security is active.

On the mainframe, this is different: When Natural Security is not active, you have to enter the operating system password. When Natural Security is active, you have to enter the Natural Security password.

## Changing the Password in the Logon Page

---

Currently, this functionality is only available for Natural for Linux and Natural for Windows.

The following information applies when the fields for entering a user ID and a password appear on the logon page. These fields do not appear when user ID and password have already been defined in the configuration file; in this case, it is not possible to change the password in the logon page.

When your password has expired, you are automatically asked for a new password. When you try to log on with your current password, an error message appears and input fields for changing the password are shown.

➤ **To change the password**

- 1 Choose the **Change password** button in the logon page.

The name of this button changes to **Don't change password** and the following two input fields are shown in the logon page:

- **New password**
- **Repeat new password**

- 2 Enter your user ID and your current password as usual.
- 3 Enter the new password in the two input fields.
- 4 Choose the **Connect** button to change the password.

Or:

If you do not want to change your password, choose the **Don't change password** button. The two input fields will then disappear.

## Browser Restrictions

---

The browser's "Back" and "Forward" buttons do not work with the Natural Web I/O Interface client and should therefore not be used.

If you want to run two Natural sessions in parallel, you have to start a new instance of the browser (for example, by choosing the corresponding icon in the Quick Launch toolbar of Windows). You must not use the browser's "New Window" function. This would result in one session running in two browsers, which is not allowed.

# 8

## Natural Client Configuration Tool

---

■ Invoking the Configuration Tool .....	50
■ Session Configuration .....	51
■ Logging Configuration .....	59
■ Logon Page .....	59
■ Logout .....	59

## Invoking the Configuration Tool

The Natural Web I/O Interface client offers a configuration tool. The configuration tool is used to create the session configurations which are then available in the logon page. It can also be used for logging purposes in case of problems; however, this should only be done when requested by Software AG support.

The configuration tool is automatically installed when you install the Natural Web I/O Interface client .

### ➤ To invoke the configuration tool

- Enter the following URL in your browser:

```
http://<host>:<port>/natuniweb/conf_index.jsp
```

where *<host>* and *<port>* are the host name and port number of your application server.

**Note:** You might wish to protect the configuration tool against unauthorized access. See [Configuring Container-Managed Security](#) for information on how to restrict the access to sensitive areas of the application server environment. If you have restricted access to the configuration tool, an authentication dialog appears. The appearance of this dialog depends on the authentication model you have chosen.

The configuration tool appears.

The configuration tool has two frames.

The home page of the configuration tool is initially shown in the right frame. It provides brief descriptions for the links provided in the left frame. It also provides links to several Software AG pages on the web.

When you have invoked a function (for example, when you are currently viewing the session configuration), you can always choose the **Home** link in the left frame to return to the home page of the configuration tool.

The functions that are invoked by the other links in the left frame are described below.

## Session Configuration

---

This section explains how to manage the content of the configuration file for the sessions. It covers the following topics:

- [Invoking the Session Configuration Page](#)
- [Global Settings](#)
- [Adding a New Session](#)
- [Editing a Session](#)
- [Overview of Session Options](#)
- [Duplicating a Session](#)
- [Deleting a Session](#)
- [Adding a New User](#)
- [Saving the Configuration](#)

### Invoking the Session Configuration Page

The content of the configuration file for the sessions is managed using the **Session Configuration** page.

To invoke the **Session Configuration** page, choose the **Session Configuration** link in the frame on the left.

The **Session Configuration** page appears in the right frame. It shows the global settings and lists all sessions and users that are currently defined. For a session, some of the configuration file information is shown. Example:

## Session Configuration

Save Configuration

### Global Settings

Last activity timeout (n seconds):

Trace directory:

SSL trust file path:

SSL trust file password:

### Sessions

Session ID	Host Name	Port Number	Application	Natural Parameters	Edit	Duplicate	Delete
Connect to Natural					Edit	Duplicate	Delete
localtestserver	localhost	6640			Edit	Duplicate	Delete

Add New Session

### Users

User ID	Edit	Duplicate	Delete
user1	Edit	Duplicate	Delete

Add New User

## Global Settings

The global settings apply for all defined sessions. You can define the following global settings in the configuration file:

Option	Description
<b>Last activity timeout (n seconds)</b>	The number of seconds that the client waits for the next user activity. When the defined number of seconds has been reached without user activity, the session is closed. The default is 3600 seconds.
<b>Trace directory</b>	<p>Optional. Location of a different trace directory.</p> <p>When a different trace directory is not defined, the trace files are written to the default trace directory. By default, the trace files are written to the directory which has been set by the Java property <code>java.io.tmpdir</code>. On Windows, this is normally the environment variable <code>TMP</code> for the user who started the application server. On Linux, this is normally <code>/tmp</code> or <code>/var/tmp</code>.</p> <p>You can also set this property in the start script for the application server.</p>

Option	Description
	Tracing can be enabled individually for each session (see <a href="#">Overview of Session Options</a> below). However, it should only be enabled when requested by Software AG support.
<b>SSL trust file path</b>	Optional. The path to your trust file. See <a href="#">Configuring SSL</a> for further information.
<b>SSL trust file password</b>	<p>If your trust file is password-protected, you have to specify the appropriate password.</p> <p>When you do not specify the password for a password-protected trust file, the trust file cannot be opened and it is thus not possible to open an SSL session.</p> <p>When your trust file is not password-protected, you should not specify a password.</p>

## Adding a New Session

You can add a new session to the configuration file.

### ➤ To add a new session

- 1 Choose the **Add New Session** button.

The **Edit Session** page appears.

- 2 Specify all required information as described below in the section [Overview of Session Options](#).
- 3 Choose the **OK** button to return to the **Session Configuration** page.

The new session is not yet available in the configuration file.

- 4 Choose the **Save Configuration** button to write the new session to the configuration file.

## Editing a Session

You can edit any existing session in the configuration file.

### ➤ To edit a session

- 1 Choose the **Edit** link that is shown next to the session that you want to edit.

The **Edit Session** page appears.

- 2 Specify all required information as described below in the section [Overview of Session Options](#).
- 3 Choose the **OK** button to return to the **Session Configuration** page.

The modifications are not yet available in the configuration file.

- 4 Choose the **Save Configuration** button to write the modifications to the configuration file.

## Overview of Session Options

The **Edit Session** page appears when you

- **add** a new session, or
- **edit** an existing session.

Example:

### Edit Session

Session ID:	<input type="text"/>
Type:	Undefined ▾
Host name:	<input type="text"/>
Port number:	<input type="text"/>
Use SSL	<input type="radio"/> Yes <input checked="" type="radio"/> No
User name:	<input type="text"/>
User name in upper case:	<input type="radio"/> Yes <input checked="" type="radio"/> No
Password:	<input type="text"/>
Application:	<input type="text"/>
Natural parameters:	<input type="text"/>
Double-click behavior:	Enter ▾
Screen rows:	<input type="text" value="24"/>
Screen columns:	<input type="text" value="80"/>
Show function key numbers:	<input type="radio"/> Yes <input checked="" type="radio"/> No
Check for numeric input:	<input checked="" type="radio"/> Yes <input type="radio"/> No
Trace:	<input type="radio"/> Yes <input checked="" type="radio"/> No
Timeout (in seconds):	<input type="text" value="60"/>
Filler character:	<input type="text"/>
<div><input type="button" value="OK"/> <input type="button" value="Cancel"/></div>	

The **Edit Session** page provides the following options:

Option	Description
<b>Session ID</b>	Mandatory. A session name of your choice. On the logon page, the session name is provided in a drop-down list box.
<b>Type</b>	<p>The platform on which user ID and password are authenticated. You can select the required setting from the drop-down list box.</p> <ul style="list-style-type: none"> <li>■ <b>Undefined</b> Default. User ID and password can have a maximum of 32 characters. See also the description for Natural for Windows or Linux below.</li> <li>■ <b>Natural for z/OS</b> User ID and password can have a maximum of 8 characters.</li> <li>■ <b>Natural for z/OS with Natural Security</b> User ID and password can have a maximum of 8 characters. The user ID must comply with the Natural naming conventions for library names .</li> <li>■ <b>Natural for Windows or Linux</b> User ID and password can have a maximum of 32 characters. When a domain is required, you have to specify it together with the user ID (in the form "<i>domain \ user-ID</i>").</li> </ul>
<b>Host name</b>	The name or TCP/IP address of the server on which Natural and the Natural Web I/O Interface server are running. When this is specified, the corresponding field does not appear on the logon page.
<b>Port number</b>	The TCP/IP port number on which the Natural Web I/O Interface server is listening. When this is specified, the corresponding field does not appear on the logon page.
<b>Use SSL</b>	<p>If set to <b>Yes</b> , a secure connection is established between the Natural Web I/O Interface client on the application server and the Natural Web I/O Interface server.</p> <p><b>Important:</b> If you want to use SSL with Natural for z/OS, one of the corresponding mainframe types must be selected; the type must not be <b>Undefined</b> or <b>Natural for Windows or Linux</b> . The other way around, if you want to use SSL with Natural for Windows or Linux, you must not select one of the mainframe types; the type may also be <b>Undefined</b> in this case.</p>
<b>User name</b>	Optional. A valid user ID for the current machine. When this is specified, the corresponding field does not appear on the logon page.
<b>User name in upper case</b>	If selected, the input field for the user ID is in upper-case mode.
<b>Password</b>	<p>Optional. A valid password for the above user ID.</p> <p>Under Windows and Linux, this is always the operating system password of the user, even if Natural Security is active.</p> <p>On the mainframe, this is different: When Natural Security is not active, this is the operating system password of the user. When Natural Security is active, this is the Natural Security password.</p>

Option	Description
	When a password is specified, the corresponding field does not appear on the logon page. The configuration tool saves the password in encrypted form.
<b>Application</b>	<ul style="list-style-type: none"> <li>■ <b>Natural for z/OS</b> The name of the Natural program or a command sequence that starts your application as you would enter it on the NEXT prompt. Example:  TEST01 data1,data2</li> <li>■ <b>Natural for Linux</b> The name of the Linux shell script for starting the Natural application (a file similar to <i>nwo.sh</i> ).</li> <li>■ <b>Natural for Windows</b> The name of the Windows command file ( <i>.bat</i> ) for starting the Natural application.</li> </ul> <p>When this is specified, the corresponding field does not appear on the logon page.</p>
<b>Natural parameters</b>	<p>Optional. Parameters for starting the Natural application. This can be stack parameters, a parameter file/module or other Natural-specific information.</p> <ul style="list-style-type: none"> <li>■ <b>Natural for z/OS</b> Used to pass dynamic Natural profile parameters to the session, for example:  SYSPARM=(MYPARMS) STACK=(LOGON MYAPPL)</li> </ul> <p><b>Note:</b> It is recommended to specify the Natural program that starts the application with the option <b>Application</b> instead of passing it with the profile parameter STACK .</p> <ul style="list-style-type: none"> <li>■ <b>Natural for Linux and Natural for Windows</b> Used when the above shell script (Linux) or command file (Windows) uses the parameter \$5 after "natural" , for example:  PARM=MYPARM STACK=(LOGON MYLIB;MENU)</li> </ul>
<b>Double-click behavior</b>	<p>The key that is to be simulated when double-clicking an output field. By default, this is the ENTER key.</p> <p>It is possible to disable the double-click behavior, or to define a function key ( PF1 through PF12 ).</p> <p>You can select the required setting from the drop-down list box.</p> <p><b>Tip:</b> When context-sensitive help has been defined for the output fields, it may be useful to define PF1 . The help function will then be invoked when the user double-clicks an output field.</p>
<b>Screen rows</b>	<p>The number of rows in the output window. Possible values: minimum 24, no upper limit. Default: 24.</p> <p>Not used by Natural for z/OS which uses the profile parameter TMODEL instead.</p>

Option	Description
<b>Screen columns</b>	The number of columns in the output window. Possible values: minimum 80, no upper limit. Default: 80.  Not used by Natural for z/OS which uses the profile parameter <code>TMODEL</code> instead.
<b>Show function key numbers</b>	If set to <b>Yes</b> , the PF key numbers are shown next to the PF keys.
<b>Trace</b>	Should only be set to <b>Yes</b> when requested by Software AG support.
<b>Check for numeric input</b>	If set to <b>Yes</b> (default), numeric input fields are validated. In this case, only the following characters are allowed in numeric input fields (in addition to the numbers "0" through "9"):  <i>blank</i> + (plus) - (minus) _ (underscore) , (comma) . (period) ? (question mark)  If set to <b>No</b> , numeric input fields are not validated.
<b>Timeout (in seconds)</b>	The number of seconds that the client waits for a response after an updated page was sent to the Natural session. When the defined number of seconds has been reached without response, the session is closed. The default is 60 seconds. Normally, you need not change this value.
<b>Filler character</b>	Optional. The filler character that is to be removed from the input fields. An application can define, for example, an underscore ( <code>_</code> ) as the filler character. Trailing filler characters will be removed from the input fields, and leading filler characters will be replaced with blanks.

## Duplicating a Session

You can add a copy of any existing session to the configuration file.

### ➤ To duplicate a session

- 1 Choose the **Duplicate** link that is shown next to the session that you want to duplicate.

A new entry is shown at the bottom of the list of sessions. Its name is "Copy of *session-ID*". The duplicated session is not yet available in the configuration file.

- 2 **Edit** and save the duplicated session as described above.

## Deleting a Session

You can delete any existing session from the configuration file.

### ➤ To delete a session

- 1 Choose the **Delete** link that is shown next to the session that you want to delete.

The session is deleted from the list of sessions. It is not yet deleted in the configuration file.

- 2 Choose the **Save Configuration** button to delete the session from the configuration file.

## Adding a New User

You can predefine Natural users and their passwords in the configuration file.

When a Natural page is opened with a URL that specifies a user in the URL parameter `natuser`, the specified user is matched against the list of users in the configuration file. When the specified user is defined in the configuration file, the corresponding password is used to authenticate the user when the Natural session is started. See also [Starting a Natural Application with a URL](#).

Example - when the following URL is used, the password defined for "user1" is used:

*`http://myhost:8080/natuniweb/natural.jsp?natuser=user1...`*

### ➤ To add a new user

- 1 Choose the **Add New User** button.

The **Edit User** page appears.

- 2 Specify a user name and password
- 3 Choose the **OK** button to return to the **Session Configuration** page.

The new user is not yet available in the configuration file.

- 4 Choose the **Save Configuration** button to write the new user to the configuration file.

**Note:** You edit, duplicate and delete a user in the same way as a session (see the corresponding descriptions above).

## Saving the Configuration

When you choose the **Save Configuration** button, all of your changes are written to the configuration file. The server picks up the new settings automatically the next time it reads data from the configuration file.

**Caution:** If you do not choose the **Save Configuration** button but log out instead or leave the configuration tool by entering another URL, the new settings are not written to the configuration file.

## Logging Configuration

---

The content of the configuration file for logging is managed using the **Logging Configuration** page. See the section [Logging](#) for detailed information.

## Logon Page

---

The configuration tool provides the following link in the left frame:

- **Natural Web I/O Interface Logon**

This link opens the logon page in the right frame.

The logon page uses the current settings in the configuration file. When you select a session from the drop-down list box, you can check whether the connection details are shown as desired. If not, you can go back to the session configuration and modify the settings of the corresponding session.

See also [About the Logon Page](#) .

## Logout

---

When the configuration tool is protected against unauthorized access and you log out of the configuration tool, you make sure that no other user can change the client configuration when you leave your PC unattended for a while.

➤ **To log out**

- In the frame on the left, choose the **Logout** link.

When the configuration tool is protected against unauthorized access, the authentication dialog is shown again.

When it is not protected, the home page is shown again.

# 9

## Ajax Configuration

---

■ Ajax Configuration Editor .....	62
■ General cisconfig.xml Parameters .....	62
■ Directory for Performance Traces .....	75
■ Central Class Path Extensions for Development .....	75

The following topics are covered below:

## Ajax Configuration Editor

---

The Ajax Configuration Editor is part of the *Natural for Ajax Runtime Tools*. It's available in every Natural for Ajax web archive. When started, it opens the active ajax configuration file *user\_cisconfig.xml*. If the configuration file doesn't exist, it opens the *cisconfig.xml* file in the <subfolder>/cis/config.

In NaturalONE, to open a *cisconfig.xml* file of your User Interface Component with the Ajax Configuration Editor: Right-click on the *cisconfig.xml* file and choose **Open with > Ajax Configuration Editor**.

## General cisconfig.xml Parameters

---

- [Control Behavior – All Controlsets](#)
- [Control Behavior – Non-Responsive Controlset](#)
- [Logging and Error Handling](#)
- [Sessions, Buffers and Caches](#)
- [Styles, Languages and Encoding - All Pages](#)
- [Styles, Languages and Encoding - Responsive Pages](#)
- [Page Behavior - Non-Responsive Pop-Ups](#)
- [Page Behavior - Natural](#)
- [Special Functions](#)
- [Developing and Testing](#)

The *cisconfig.xml* file contains some general control information. The following is a very basic example:

```
<cisconfig startmonitoringthread="true"
  requestclienthost="false"
  debugmode="false"
  loglevel="EWI"
  logtoscreen="false"
  sessiontimeout="3600"
  xmldatamanager="com.softwareag.cis.xmldata.filebased.XMLDataManager"
  useownclassloader="true"
  browserpopuponerror="false"
  framebuffersize="3"
  ↵
onlinehelpmanager="com.softwareag.cis.onlinehelp.projectbased.FrameHelpOHManager"
  textencoding="UTF-8"
```

```
enableadapterpreload="true">
</cisconfig>
```

## Control Behavior – All Controlsets

Parameter	Description
buttonctrlenter	<p>Default false.</p> <p>If set to true &lt;ctrl&gt;&lt;enter&gt; on a focused button will trigger the button method.</p>
completedateinput	<p>Default: true.</p> <p>By default, partial input in the DATEINPUT control is automatically completed.</p> <p>When you set this parameter to "false", no automatic completion will be done, thus forcing end-users to always enter the complete date.</p> <p>Values: true/false.</p>
completedateinputrange	<p>Default: 999</p> <p>If the setting completedateinput is set to false, the completedateinputrange is ignored.</p> <p>Valid values:</p> <p>999 : Compatibility with versions before 932. For a two-digit year value 00 - 49, the current century is set. For a two-digit year value 50 - 99, the previous century is set.</p> <p>0 : For a two-digit year value, the current century is set.</p> <p>1 : 99 Same behavior as the Natural YSLW profile parameter. For details, see <i>Parameter Reference &gt; YSLW - Year Sliding or Fixed Window</i> in the Natural documentation.</p> <p>1582-2600 : Same behavior as the Natural YSLW profile parameter. For details, see <i>Parameter Reference &gt; YSLW - Year Sliding or Fixed Window</i> in the Natural documentation.</p>
customdates	<p>You can specify several customdates (YYYY-MM-DD) separated by a semi-colon. Entering a custom date in the browser doesn't display a validation error.</p>
displayallowtab	<p>Default: true</p> <p>Defines if tabbing into DISPLAY input controls is possible.</p>
accessibilityroles	<p>Default: true</p> <p>Defines for controls and container that corresponding role attributes for accessibility are generated.</p>
fieldnumerictypesrightaligned	<p>Default: false.</p>

Parameter	Description
	<p>Set this parameter to "true" in order to right-align text within the FIELD control when using the data type <code>int</code>, <code>long</code> or <code>float</code>.</p> <p>Values: true/false.</p>
<code>flushreceivespreviousfocused</code>	<p>Default: false.</p> <p>By default, during a flush event the adapter gets as focus information the input control that <i>received</i> the focus. Set this parameter to "true" if during a flush event your application relies on getting as focus information the input control that <i>lost</i> the focus.</p> <p>For Natural applications this means: By default, the Natural system variable <code>*CURS-FIELD</code> contains during the flush event the value of the Natural system function <code>POS</code> for the input control that received the focus.</p> <p>Values: true/false.</p>
<code>suppressfocusmanagement</code>	<p>Default: false.</p> <p>If you set this parameter to "true", no focus management in the client will be done after a server round trip. This means: The focus will not be set to focus-requesting controls such as "EDIT" fields with "ERROR" status after a server round trip.</p> <p>Usually, you do not set this parameter. If you need to suppress focus management for specific server round trips, you usually do this from within your adapter code for these specific server round trips. See also the <code>focusmgtp</code> in the NATPAGE control. Only set this parameter to "true" if your application needs to do it vice versa: Suppress focus mangement for nearly all server round trips and only explicitly activate focus management for some specific server round trips from within your adapter code.</p> <p>Values: true/false.</p>

## Control Behavior – Non-Responsive Controlset

Parameter	Description
<code>animatecontrols</code>	<p>Default: true.</p> <p>Defines how Application Designer handles the animation of controls. There are several controls that can be rendered in an animated way and in a standard way.</p> <p>Setting this parameter to "false" can help to improve performance, especially if you are not using the newest hardware.</p> <p>Values: true/false.</p>

Parameter	Description
maxitemsinfieldcombo	<p>Default: 100.</p> <p>The FIELD control provides for a predefined pop-up method <code>openIdValueComboOrPopup</code>. Depending on the size of the list of valid values, the list is either shown in a combo box or in a pop-up. Use this parameter to control the maximum number of entries that are to be shown in the combo box.</p> <p>Value: integer number.</p>
takeoutfieldpopupicon	<p>Default: false.</p> <p>Set this parameter to "true" in case you are using right-aligned FIELD controls with value help. This will avoid overlapping of the right-aligned text and the corresponding drop-down icon.</p> <p>Values: true/false.</p>
valuehelpkeys	<p>You can specify your own keys to open the value help pop-up and/or combo box in a FIELD control. The keys are specified in the same way as hot keys. Example:</p> <pre>valuehelpkeys = "ctrl-65;ctrl-alt-66"</pre>
resetstatusbarbefore	<p>Default: false.</p> <p>When set to true, the status bar messages are reset in the browser before a server roundtrip is done.</p> <p>Values: true/false.</p>
resetstatuspropfocus	<p>Default: false.</p> <p>If set to "true", statusprop values FOCUS and FOCUS_NO_SELECT will automatically be reset to the default value; statusprop value ERROR will be reset to ERROR_NO_FOCUS. The reset is done before the next server round-trip to Natural, so that the Natural program will receive the changed value. This way, the focus is set only once without having to actively reset the statusprop value in the next server round-trip. The Natural for Ajax runtime will take care of the reset.</p>
clientsideerrorinstatusbar	<p>Default: false.</p> <p>By default, client-side error messages are displayed as pop-ups.</p> <p>When you set this parameter to "true", client-side error messages are displayed in the status bar.</p> <p>Values: true/false.</p>
usemessagepopup	<p>Default: false.</p>

Parameter	Description
	<p>Set this parameter to "true" in order to show status messages as message pop-ups.</p> <p>Values: true/false.</p>
<code>itinlineDisplay</code>	<p>Only set this if you notice rounding issues with pixel-sizing in ITRs while zooming the page in Google Chrome and/or Edge Chromium.</p>

## Logging and Error Handling

Parameter	Description
<code>browserpopuponerror</code>	<p>Default: false.</p> <p>Defines how Application Designer handles it if the application behind an Application Designer page throws an error.</p> <p>By default (false), the browser switches to an error screen. In the screen, the user can only abort the current function. This is the default way in which any kind of inconsistency is automatically omitted.</p> <p>When you set <code>browserpopuponerror</code> to "true", the browser opens a pop-up window in which the error is output. This setting should only be used during development because it may cause inconsistencies in the application.</p> <p>Values: true/false.</p>
<code>debugmode</code>	<p>Default: false.</p> <p>A log is written permanently into Application Designer's <i>log</i> directory. When <code>debugmode</code> is set to "true", a lot of information which normally is not required is written to the log.</p> <p>Be aware that you can also set the debug mode dynamically within your running system. Application Designer provides a monitoring tool in which you can switch the debug mode on and off.</p> <p>Values: true/false.</p>
<code>errorreactionadapter</code>	<p>In case of an unhandled application error, the Application Designer runtime navigates to an error page. The class name specified in <code>errorreactionadapter</code> is the Java adapter for this error page.</p> <p>If an error reaction adapter is not specified, a default adapter is used which shows the error's stack trace.</p> <p>The Application Designer framework contains a second error reaction adapter with the class name <code>com.softwareag.cis.server.SecureErrorReactionAdapter</code>. For security reasons, this adapter does not show a stack trace but only an error message.</p>

Parameter	Description
	<p>You can write your own error reaction adapter and create your own error page. An error reaction adapter must implement one of the interfaces <code>com.softwareag.cis.server.ISecureErrorReactionAdapter</code> or <code>com.softwareag.cis.server.IErrorReactionAdapter</code>. For more information, see the corresponding Java documentation.</p>
<code>loglevel</code>	<p>Default: EWI.</p> <p>Defines the message types that are to be logged. Values:</p> <p>E (error)  W (warning)  I (information)  D (debug)  N (no logging)</p> <p>You can specify any combination of message types by concatenating the message types.</p> <p>Example: "EW" logs all error and warning messages. "EWI" additionally logs information messages.</p> <p>Specify "N" (no logging) to switch off writing log messages to a logfile.</p> <p><b>Caution:</b> When having set <code>debugmode</code> to "true", the <code>loglevel</code> filter is automatically bypassed and all messages are logged. <code>debugmode</code> is stronger than <code>loglevel</code>.</p>
<code>logtoscreen</code>	<p>Default: false.</p> <p>If this parameter is set to "true", all Application Designer log information is also output to the command screen from which you started Application Designer. This parameter should only be set to "true" if running in development mode.</p> <p>Values: true/false.</p>
<code>maxserverlogage</code>	<p>Default: -1 (log files are not automatically deleted).</p> <p>When setting <code>maxserverlogage</code> to a value <math>&gt; 0</math>, <code>ServerLog*.log</code> files, which are older than the set number of days, are automatically deleted.</p> <p>For example, if <code>maxserverlogage</code> is set to 3, all <code>ServerLog*.log</code> files, which are older than 3 days are automatically deleted.</p> <p>If <code>startmonitoringthread</code> is set to false, this parameter has no effect.</p>
<code>monitoringthreadinterval</code>	<p>Default: 5000.</p> <p>The interval in milliseconds for the wake-up of the monitoring thread. If <code>startmonitoringthread</code> is set to false, this parameter has no effect.</p>
<code>startmonitoringthread</code>	<p>Default: true.</p>

Parameter	Description
	<p>If set to "true", a monitoring thread is opened which by default wakes up every 5 seconds. You can customize this value by setting the parameter <code>monitoringthreadinterval</code>. The thread performs the following activities:</p> <ol style="list-style-type: none"> <li>1. It initiates a garbage collection periodically (every two minutes).</li> <li>2. It writes all log information into a log file (every <math>n</math> milliseconds. Where <math>n</math> represents the interval length defined in the <code>monitoringthreadinterval</code> parameter).</li> <li>3. It calls the clean up of sessions which are timed out (every two minutes)</li> <li>4. It checks for user interface component updates, which need to be deployed.</li> </ol> <p>What happens if the monitoring thread is not started?</p> <ol style="list-style-type: none"> <li>1. No garbage collection will be triggered by Application Designer. This is then the task of the servlet container around.</li> <li>2. The log is not automatically written to the file location specified in the <i>web.xml</i> file, but is written to the servlet container's logging.</li> <li>3. Timing out sessions is not done every two minutes but every thousand requests.</li> <li>4. No user interface deployment will be done.</li> </ol> <p><b>Caution:</b> Some servlet containers do not allow to let the web application start new threads (for example, the Sun reference implementations do so). For these containers, the parameter must be set to "false".</p> <p>Values: true/false.</p>
<code>licwarningsfor</code>	<p>Semicolon separated list of hostnames. When the web application is called with an URL containing one of these hostnames and the license is in the expiration period of 40 days, an alert box with a license warning is shown once per day.</p>

## Sessions, Buffers and Caches

Parameter	Description
<code>createhttpsession</code>	<p>Default: false.</p> <p>Internally, Application Designer does not require HTTP session management that is provided by the servlet container. Some application servers (especially in clustered scenarios in which Application Designer runs in several nodes) require an explicit HTTP session ID to be used in order to route requests from a browser client always to the right application server node in the cluster. Set <code>createhttpsession</code> to "true" in this case.</p> <p>Values: true/false.</p>

Parameter	Description
<code>sessiontimeout</code>	<p>Default: 3600 (1 hour).</p> <p>Application Designer sessions are timed out according to the value defined with this parameter. This is the definition of the timeout phase in seconds. By default, 3600 is defined in the configuration file. If no parameter is specified in the configuration file, 7200 is used.</p> <p>Value: integer number.</p>
<code>urlsessiontimeout</code>	<p>When Application Designer times out a session (see the <code>sessiontimeout</code> parameter) and the user tries to continue to work with the session, a page will be displayed inside the user's browser, indicating that a timeout happened with the user's session. By default, this page is an Application Designer page that you might not want to show to your application users.</p> <p>Value: the URL of the page that is to be shown instead of the default page.</p>
<code>sessionidasthreadname</code>	<p>Default: true.</p> <p>On start of each page request processing, the Application Designer runtime calls the method <code>Thread.setName</code> with the current session ID (default).</p> <p>You can set this parameter to "false" to instruct the Application Designer runtime not to touch the thread's name.</p> <p>Values: true/false.</p>
<code>enableadapterpreload</code>	<p>Default: true.</p> <p>By default, the server sends all required responses at once to the client, even if different adapters are involved.</p> <p>If set to "false", a separate data transfer occurs for each involved adapter.</p>
<code>framebuffersize</code>	<p>Default: 3.</p> <p>Each page in the browser client runs inside a surrounding page. This surrounding page offers a couple of internal functions, one of them to buffer contained Application Designer pages: if a user opens the first page and then navigates to a second page, the first page is internally kept inside a frame buffer. If returning to the first page later on, the browser does not have to build up the first page from scratch but just switches to the buffered page.</p> <p>The <code>framebuffersize</code> defines the number of buffered pages. Increasing the <code>framebuffersize</code> means that more resources are used on the client (browser) side. When changing this value, you should test the memory consumption on the client side before rolling out the change to productively running implementations.</p> <p>Value: integer number.</p>
<code>maxworkplaceactivities</code>	<p>Default: -1 (unlimited).</p> <p>The maximum number of workplace activities in a workplace application.</p>

## Styles, Languages and Encoding - All Pages

Parameter	Description
defaulttcss	<p>You can set your own default style sheet for your entire application. For example:</p> <pre>../cis/styles/MY_STYLE.css</pre>
defaultlanguage	<p>Default: en (English).</p> <p>Defines the language that is to be used by default when starting Application Designer. If not set, "en" is used.</p>
multilanguagemanager	<p>Internally, Application Designer uses an interface to retrieve the translation information for a certain text ID and a certain language. A default implementation is available that stores the corresponding language information in files that are part of the web application.</p> <p>Value: the name of the class that supports Application Designer's multi-language interface.</p>
onlinehelpmanager	<p>Application Designer accesses a certain URL when the user presses F1 on certain controls (for example, fields, check boxes and others). Application Designer transfers a corresponding help ID that is defined with the control into a URL and opens this URL in a pop-up window. If you have your own mechanisms for defining this URL, you can implement a corresponding Application Designer Java interface (<code>com.softwareag.cis.onlinehelp.IOHManager</code>).</p> <p>Value: the name of the interface.</p>
textencoding	<p>Default: UTF-8.</p> <p>By default, Application Designer reads and writes text files in UTF-8 format. You can tell Application Designer to use a different format (for example, for writing XML layout definitions). But be very careful and very aware of what you are doing.</p>

## Styles, Languages and Encoding - Responsive Pages

Parameter	Description
uselatestbootstrap	<p>If set to true Bootstrap 4 is used. If set to false Bootstrap 3 is used. When changing this setting you need to regenerate you page layouts.</p> <p>Default: true. Bootstrap 4 is used.</p> <p>Values: true/false.</p>
defaulttbmobilecss	<p>Set your Natural for Ajax specific responsive stylesheet for the whole application (Bootstrap 3).</p> <p>See the documentation of <i>Natural for Ajax &gt; Responsive Natural Page Layout &gt; Styling a Responsive Page</i>.</p>

Parameter	Description
defaultbmobilecss4	<p>Set your Natural for Ajax specific responsive stylesheet for the whole application (Bootstrap 4).</p> <p>See the documentation of <i>Natural for Ajax &gt; Responsive Natural Page Layout &gt; Styling a Responsive Page</i>.</p>
defaultresponsivecss	<p>Set your Bootstrap stylesheet for the whole application (Bootstrap 3).</p> <p>See the documentation of <i>Natural for Ajax &gt; Responsive Natural Page Layout &gt; Styling a Responsive Page</i>.</p>
defaultresponsivecss	<p>Set your Bootstrap stylesheet for the whole application (Bootstrap 4).</p> <p>See the documentation of <i>Natural for Ajax &gt; Responsive Natural Page Layout &gt; Styling a Responsive Page</i>.</p>
defaultresponsivecss	<p>Set your DataTables Theme (Bootstrap 3).</p> <p>See the documentation of <i>Natural for Ajax &gt; Responsive Natural Page Layout &gt; Styling a Responsive Page</i>.</p>
defaultdatatablescss4	<p>Set your DataTables Theme (Bootstrap 4).</p> <p>See the documentation of <i>Natural for Ajax &gt; Responsive Natural Page Layout &gt; Styling a Responsive Page</i>.</p>

## Page Behavior - Non-Responsive Pop-Ups

Parameter	Description
usepagepopup	<p>Default: false.</p> <p>Set this parameter to "true" in order to open Natural for Ajax pop-ups as page pop-ups instead of browser pop-ups.</p> <p>Values: true/false.</p>
pagepopupenterhotkey	<p>Default: false.</p> <p>By default, the <code>reactOnPagePopupEnterKey</code> event is not triggered when ENTER is pressed in the page pop-up.</p> <p>When setting this parameter to "true", the event <code>reactOnPagePopupEnterKey</code> is triggered when ENTER is pressed in the page pop-up. This event can be processed in the Natural program.</p> <p>Values: true/false.</p>
pagepopuphorizontal	<p>Use this to automatically adapt the size of a page pop-up if it does not fit to its parent because the parent width is not big enough. Supported values are "zoom" and "resize". If set to "resize" the width of a page pop-up is reduced. If set to "zoom" the page pop-up will automatically be zoomed in.</p> <p>Values: resize/zoom.</p>

Parameter	Description
pagepopupvertical	<p>Use this to automatically adapt the size of a page pop-up if it does not fit to its parent because the parent height is not big enough. Supported values are "zoom" and "resize". If set to "resize" the height of a page pop-up is reduced. If set to "zoom" the page pop-up will automatically be zoomed in.</p> <p>Values: resize/zoom.</p>
pagepopuponresize	<p>Default: false.</p> <p>If set to true an open page pop-up is resized when it's parent is resized.</p> <p>Values: true/false.</p>
popupparentdisabled	<p>Default: false.</p> <p>When setting this parameter to "true", the parent page of a page pop-up is rendered disabled while the pop-up is open. It only applies to page pop-ups.</p> <p>Values: true/false.</p>

## Page Behavior - Natural

Parameter	Description
natuppercase	<p>Default: false.</p> <p>Set this parameter to "true" if your Natural program only allows Latin upper-case characters. This is the case, for example, if your Natural program uses the Hebrew codepage CP803.</p> <p><b>Important:</b> Set the parameter <code>natuppercase="true"</code> <i>before</i> you implement your main program with Natural for Ajax. If you set this parameter after the implementation, you will have to change all Latin lower-case characters to upper-case manually.</p> <p>Values: true/false.</p>
notifyparentonpopupclosed	<p>Default: true.</p> <p>If this parameter is set to "false", no <code>nat:page.default</code> will be sent to the parent Natural program after a pop-up is closed. Otherwise the parent Natural program will receive a <code>nat:page.default</code> event after a pop-up is closed.</p> <p>Values: true/false.</p>

## Special Functions

Parameter	Description
<code>urlopenstreetmapgeocoder</code>	<p>URL used to access the third party geocoder for the OPENSTREETMAP controls.</p> <p>You usually do not have to specify this parameter. However, if the URL of the server of this third party geocoder changes, you can adapt the URL here correspondingly.</p>
<code>urlbackbuttonpressed</code>	<p>When the browser back button is pressed, in some cases the page is not synchronized with the server anymore and the session has to be closed. In these cases a default page is displayed. Instead of this default page you can define a URL to a custom page.</p> <p>Value: the URL of the page that is to be shown instead of the default page.</p>
<code>reloadpageonbackbutton</code>	<p>Default: false.</p> <p>If set to true, the Ajax framework tries to reload the page when the back button is pressed. A corresponding message box is displayed to inform the end-user about the reload.</p>
<code>requestclienthost</code>	<p>Default: false.</p> <p>If a client sends an HTTP request, it is determined for the first request from which client this request is coming. This operation is sometimes quite expensive. For this reason, you can switch it off. If switched off, there is no disadvantage in normal operation, besides in the monitoring tool you cannot identify which session belongs to which client.</p> <p>Values: true/false.</p>
<code>requestdataconverter</code>	<p>Application Designer allows to pass each value that is input by the user through an explicit data converter on the server side, prior to passing this value to the application. In the data converter, you can implement certain security checks, for example, you can prevent users from inputting string sequences containing inline JavaScript or SQL scripting. See the interface <code>com.softwareag.cis.server.IRequestDataConverter</code> for more information.</p> <p>Value: name of a class that implements the interface <code>com.softwareag.cis.server.IRequestDataConverter</code>.</p>
<code>sdofullpath</code>	<p>Default: false</p> <p>The default setting enables the product's XSLT processor implementation. If switched to true, the 3rd party Xalan implementation is used instead of the product's functionality. Should you decide to use Xalan, download Xalan 2.7.2 from the Apache download sites.</p> <p><b>Note:</b> Xalan 2.7.2 contains a vulnerable.</p>

Parameter	Description
xmlDataManager	This parameter defines the file name of the class which implements the <code>com.softwareag.cis.xmldata.IXMLDataManager</code> interface. You can specify an own class here. The <code>com.softwareag.cis.xmldata.XMLDataManagerFactory</code> creates an instance using a constructor without any parameter.
workplacehotkeys	<p>You can specify hot keys with which you can switch back and forth between the activities in a workplace.</p> <p>The first entry defines the key for forward switching and the second entry defines the key for backward switching. The following example defines CTRL page up and CTRL page down as corresponding hotkeys:</p> <pre>workplacehotkeys = "ctrl-34;ctrl-33"</pre>

## Developing and Testing

Parameter	Description
htmlgeneratorlog	<p>Default: false.</p> <p>By default <i>.protocol</i> files are written during the HTML generation. If set to "true", an additional <i>.log</i> file is written for each layout.</p> <p>Only set this to "true", if you cannot resolve generation errors via the Layout Painter error marking. It reduces generation performance.</p>
designtimeclassloader	<p>By default, Application Designer uses an own class loader for accessing adapter classes at design time. (You can switch this off by specifying <code>useownclassloader="false"</code>.)</p> <p>With the <code>designtimeclassloader</code>, you can explicitly select a class loader class that Application Designer is to use. This allows you to use class loaders that offer special functions such as reading encrypted class files.</p> <p>Value: the name of a class loader class.</p>
useownclassloader	<p>Default: true.</p> <p>If set to "true", Application Designer uses its own class loader to load application classes.</p> <p>This parameter may be set to "false" in certain environments, for example, if you use Application Designer inside an environment which requires all application classes to run in the environment's own class loader environment.</p> <p><b>Caution:</b> The Application Designer class loader automatically searches for classes in certain directories (<code>&lt;project&gt;/appclasses/classes</code> and <code>&lt;project&gt;/appclasses/lib</code>). If you do not use the Application Designer class loader, you have to set up your environment accordingly.</p>

Parameter	Description
	Values: true/false.
zipcontent	<p>Default: true.</p> <p>Between the browser and the server, data content is exchanged. By default, Application Designer zips the content before sending a response from the server to the browser client.</p> <p>Sometimes you may want to actually “see” what is being sent (maybe you have a test tool that captures the HTTP protocol). Set <code>zipcontent</code> to "false" if you do not want Application Designer to zip the data content returned to the client.</p> <p>Values: true/false.</p>
testtoolidhtml4	<p>Default: false.</p> <p>If set to "true", the HTML attribute generated for the test tool IDs has the name "testtoolid". Otherwise, the name is "data-testtoolid". See also the information on standards mode and HTML5 in the Natural for Ajax documentation.</p>

## Directory for Performance Traces

The `requestrecording` section of the `cisconfig.xml` file indicates the directory in which recorded performance traces are stored.

```
<cisconfig ...>
  <requestrecording recordrequests="false"
                    recorddirectory="c:/temp/traces/">
  </requestrecording>
</cisconfig>
```

## Central Class Path Extensions for Development

If you want to use your own class path extension, you may add a subsection to the `cisconfig.xml` file in which you extend the class path of the Application Designer class loader at development time:

```
<cisconfig ...>
  <classpathextension path="c:/development/centralclasses/classes"/>
  <classpathextension path="c:/development/centralclasses/libs/central.jar"/>
</cisconfig>
```

Each class path extension is listed with a reference to its physical path.

# 10

## Design Time Mode and Runtime Mode

---

■ When to Use which Mode .....	78
■ Setup .....	78
■ Class Loader Considerations .....	79
■ File Access Considerations .....	79

Application Designer may run in two different modes:

### Design Time Mode

All resource files which are required by Application Designer are read from the file system using the `cis.home` parameter value inside the *web.xml* configuration file.

The Application Designer class loader may be used. This means you can use the feature to dynamically reload application classes without having to restart the web application all the time.

### Runtime Mode

All resource files are read internally via mechanisms of the servlet container, by which a web application can access its resource files.

The Application Designer class loader must not be used.

## When to Use which Mode

---

The design time mode is typically used in the following scenarios:

- During development.
- With productive installations, if they are not clustered.

The runtime mode is used in the productive installations which are distributed by the servlet container or application server on several cluster nodes.

The design time mode has the advantage that all resources are read from the file system, and are not blocked after access. This means that you can recreate and change these resources without restarting the web application. This simplifies the development a lot.

## Setup

---

The switch from design time mode and runtime mode is configured in the *web.xml* file:

- If the `cis.home` parameter is set, the design time mode is switched on.

```
<init-param id="CISHOME">  
  <param-name>cis.home</param-name>  
  <param-value>REALPATH</param-value>  
</init-param>
```

- If the `cis.home` parameter is not set, the runtime mode is switched on.

```
<!--  
<init-param id="CISHOME">  
  <param-name>cis.home</param-name>  
  <param-value>REALPATH</param-value>  
</init-param>  
-->
```

## Class Loader Considerations

Application Designer may use its own class loader below the web application's class loader. The purpose of this class loader is to dynamically replace classes during development in order to run newly compiled versions of your software without having to restart the web application all the time. Both, "own" and standard runtime class loaders expect classes to be located at different locations. As a consequence, you have to copy classes accordingly in order to bring your application from design time mode to runtime mode.

In the configuration file [cisconfig.xml](#), you can switch this possibility on or off.

## File Access Considerations

In design time mode (having a defined *cis.home* directory), classes and Application Designer resources (multi-language files) are read from the file system. The reason is that classes can be re-loaded without restarting the web application. In runtime mode, this is not done anymore: classes are read by the web application class loader, resources are read via the servlet context.

Consequence: there is no dependency from any file access to a predefined directory - Application Designer is completely clusterable.

# 11

## Natural Web I/O Style Sheets

---

■ Name and Location of the Style Sheets .....	82
■ Editing the Style Sheets .....	82
■ Modifying the Position of the Main Output and of the PF Keys .....	82
■ Modifying the Font Size .....	83
■ Modifying the Font Type .....	84
■ Defining Underlined and Blinking Text .....	85
■ Defining Italic Text .....	86
■ Defining Bold Text .....	86
■ Defining Different Styles for Output Fields .....	87
■ Modifying the Natural Windows .....	87
■ Modifying the Message Line .....	88
■ Modifying the Background Color .....	88
■ Modifying the Color Attributes .....	89
■ Modifying the Style of the PF Key Buttons .....	90
■ JavaScript and XSLT Files .....	91

## Name and Location of the Style Sheets

---

Several aspects on a page (such as font, font style or color) are controlled by a style sheet (CSS file).

The Natural Web I/O Interface client is delivered with the style sheet *3270.css* , which is located in:

`../natuniapp.ear/natuniweb.war/resources`

**Note:** For more information on style sheets, see <http://www.w3.org/Style/CSS/> .

## Editing the Style Sheets

---

It is recommended that you have a basic understanding of CSS files.

You can edit the predefined style sheets or create your own style sheets.

It is recommended that you work with backup copies. When a problem occurs with your style sheet, you can thus always revert to the original state.

To see your changes in the browser, you have to

1. delete the browser's cache, and
2. restart the session.

## Modifying the Position of the Main Output and of the PF Keys

---

Applies when only the named PF keys are displayed. This feature cannot be used when all PF keys are displayed, since they are always displayed at the same position. See also [Overview of Session Options](#) .

The following elements are available:

Element Name	Description
.mainlayer	Controls the position of the main output in the output window. Used for languages that are written from left-to-right (LTR).
.mainlayer_rtl	Controls the position of the main output in the output window. Used for languages that are written from right-to-left (RTL).
.pfkeydiv	Controls the position of the PF keys in the output window. Used for languages that are written from left-to-right (LTR).
.pfkeydiv_rtl	Controls the position of the PF keys in the output window. Used for languages that are written from right-to-left (RTL).

The \*\_rtl elements are only used if Natural sends the web I/O screen with a right-to-left flag ( SET CONTROL 'VON' ). In the browser, the screen elements are then shown on the right side (instead of the left side).

For web I/O in applications where only the left-to-right orientation is used, the \*\_rtl elements are not required.

If the PF keys are to appear at the bottom, define the elements as shown in the following example:

```
/* Defines the main screen position */ .mainlayer { top: 5px;
  left: 0px;
  height: 550px; } /* Defines the main screen position for right-to-left */ ↵
.mainlayer_rtl { top: 5px;
  right: 30px;
  height: 550px; } /* Defines the PF keys screen position */ .pfkeydiv { height: ↵
70px;
  left: 0px;
  top: 580px; width: 100%; } /* Defines the PF keys screen position for ↵
right-to-left */ .pfkeydiv_rtl { height: 70px;
  right: 30px;
  top: 580px; width: 100%; }
```

## Modifying the Font Size

Depending on the screen resolution, one of the following style sheets for defining the font size is used in addition to the default style sheet:

- *model2.css*
- *model3.css*
- *model4.css*
- *model5.css*

These style sheets are located in the *tmodels* subdirectory of the *resources* directory in which all style sheets are located.

Depending on what comes closest to the standard 3270 screen model, the corresponding style sheet from the *tmodels* subdirectory is automatically used. It is selected according to the following criteria:

Standard 3270 Screen Model	Criteria	Style Sheet
Model 2 (80x24)	30 rows or less.	<i>model2.css</i>
Model 3 (80x32)	Between 31 and 40 rows.	<i>model3.css</i>
Model 4 (80x43)	41 rows or more.	<i>model4.css</i>
Model 5 (132x27)	30 rows or less, and more than 100 columns.	<i>model5.css</i>

The font sizes in the above style sheets can be adjusted. Example for *model4.css* :

```
body { font-size: 10px; }
```

The default font sizes for the above 3270 screen models are:

Standard 3270 Screen Model	Default Font Size
Model 2	16px
Model 3	14px
Model 4	10px
Model 5	12px

## Modifying the Font Type

---

As a rule, you should only use monospace fonts such as Courier New or Lucida Console. With these fonts, all characters have the same width. Otherwise, when using variable-width fonts, the output will appear deformed.

If you want to define a different font type, you should define the same font type for the body, the output fields and the input fields as shown in the following example:

```
body {  
    background-color: #F3F5F0;  
    font-family: Lucida Console;  
}  
  
.OutputField {  
    white-space:pre;  
    border-width:0;  
    font-family: Lucida Console;
```

```

    font-size: 100%;
}

.InputField {
    background-color: white;
    font-family: Lucida Console;
    border-width: 1px;
    font-size: 100%;
    border-color: #A7A9AB;
}

```

Use the CSS at-rule `@font-face` to specify a custom font with which to display text.

For example, Arabic fonts to be used with `InputFields` for the presentation of "Arabic-Indic numerals" instead of "European numerals":

```

@font-face {
    font-family: CustomFont;
    src: url( CustomFont.woff );
}

```

## Defining Underlined and Blinking Text

The following elements are available:

Element Name	Description
<code>.natTextDecoUnderline</code>	Defines underlined text.
<code>.natTextDecoBlinking</code>	Defines blinking text.
<code>.natTextDecoNormal</code>	Defines normal text (no underline, no blinking).

Example:

```

/* Text decoration */
.natTextDecoUnderline { text-decoration:underline; }
.natTextDecoBlinking {text-decoration:blink; }
.natTextDecoNormal {text-decoration:normal;}

```

Blinking text is not supported by the Internet Explorer.

## Defining Italic Text

---

The following elements are available:

Element Name	Description
<code>.natFontStyleItalic</code>	Defines italic text.
<code>.natFontStyleNormal</code>	Defines normal text (no italics).

Example:

```
/* font style */
.natFontStyleItalic {font-style:italic;}
.natFontStyleNormal {font-style:normal;}
```

## Defining Bold Text

---

The following elements are available:

Element Name	Description
<code>.natFontWeightBold</code>	Defines bold text.
<code>.natFontWeightNormal</code>	Defines normal text (not bold).

```
/* Font weight */
.natFontWeightBold {font-weight:bolder;}
.natFontWeightNormal {font-weight:normal;}
```

When you define bold text ( `{font-weight:bolder;}` ) for the default font Courier New, your text always has the same width as with normal text ( `{font-weight:normal;}` ).

However, when you define bold text for Courier or Lucida Console, the bold text will be wider than the normal text and your output may thus appear deformed. It is therefore recommended that you switch off bold text for Courier and Lucida Console:

```
.natFontWeightBold {font-weight:normal;}
```

## Defining Different Styles for Output Fields

The following elements are available:

Element Name	Description
.FieldVariableBased	Defines the style for output fields that are based on a variable.
.FieldLiteralBased	Defines the style for output fields that are based on a literal.

Example:

```
.FieldVariableBased {
    /* font-style:italic; */
}

.FieldLiteralBased {
    /* font-style:normal; */
}
```

**Note:** In the above example, as well as in the standard CSS files delivered by Software AG, the variable-based output fields are defined as italic, but are commented out.

## Modifying the Natural Windows

The following elements are available:

Element Name	Description
.naturalwindow	Controls the rendering of the Natural windows.
.wintitle	Controls the rendering of the titles of the Natural windows.

Example:

```
.naturalwindow {
    border-style: solid;
    border-width: 1px;
    border-color: white;
    background-color: black;
}

.wintitle {
    left: 0px;
    top: 1px;
    height: 17px;
}
```

```
width: 100%;
color: black;
font-size: 100%;
font-weight: bold;
background-color: white;
text-align: center;
font-family: Verdana;
border-bottom-style: solid;
border-bottom-width: 2px;
}
```

**Note:** In a mainframe environment, you have to set the Natural profile parameter `WEBIO` accordingly to enable this feature. See *WEBIO - Web I/O Interface Screen Rendering* in the *Parameter Reference* which is provided with Natural for z/OS.

## Modifying the Message Line

---

The rendering of the message line is controlled by the `.MessageLine` element.

Example:

```
.MessageLine {
    color: blue;
}
```

**Note:** In a mainframe environment, you have to set the Natural profile parameter `WEBIO` accordingly to enable this feature. See *WEBIO - Web I/O Interface Screen Rendering* in the *Parameter Reference* which is provided with Natural for z/OS.

## Modifying the Background Color

---

The background color is defined in the `body` element.

Example:

```
body {
    background-color: #F3F5F0;
    font-family: Lucida Console;
}
```

## Modifying the Color Attributes

---

You can define different colors for all Natural color attributes. These are:

Red  
Green  
Blue  
Yellow  
White  
Black  
Pink  
Turquoise  
Transparent

You can define these color attributes for input fields and output fields, and for normal output and reverse video.

The following examples show how to define the color attribute “Red” .

Define the color for a normal output field:

```
.natOutputRed {color: darkred;}
```

Define the foreground and background colors for an output field with reverse video:

```
.reverseOutputRed {background-color: darkred; color:#F3F5F0;}
```

Define the color for a normal input field:

```
.natInputRed {color: darkred;}
```

Define the foreground and background colors for an input field with reverse video:

```
.reverseInputRed {background-color: darkred; color:#F3F5F0;}
```

## Modifying the Style of the PF Key Buttons

---

The following elements are available:

Element Name	Description
.PFButton	Controls the style for normal rendering.
.PFButton: hover	Controls the style that is used when the mouse hovers over a PF key button.

Example:

```
.PFButton {
    text-align: center;
    width: 90px;
    border-style: ridge;
    border-width: 3px;
    padding: 2px;
    text-decoration: none;
    font-family: Verdana;
    font-size: 12px;
    height: 22px;
}

.PFButton: hover {
    color: #FFFF00;
    background-color: #222222;
}
```

**Note:** In a mainframe environment, you have to set the Natural profile parameter `WEBIO` accordingly to enable this feature. See *WEBIO - Web I/O Interface Screen Rendering* in the *Parameter Reference* which is provided with Natural for z/OS.

## JavaScript and XSLT Files

In addition to the CSS files described above, the Natural Web I/O Interface client uses XSLT files with specific names for the conversion of the Natural Web I/O Interface screens from the internal XML format to HTML. The HTML also contains calls to JavaScript. For Web I/O screens the following conversion is done:

- Input text is placed into the HTML element `<input>`.
- Output text is placed into the HTML element `<input>` (with attribute `readonly="readonly"`).
- A message line is placed into the HTML element `<span>`.
- PF keys are embedded in an XML island and then rendered with JavaScript.
- Window elements are embedded in an XML island and then rendered with JavaScript.

The conversion is done at runtime by the following product files of your web application:

1. `<mywebapp>/WEB-INF/transuni.xml`
2. `<mywebapp>/scripts/natuniscript.js`

The XSLT file *transuni.xml* is only read once when the server is started.

**Important:** Do not change the above files. Software AG may change the functionality of these files in new versions or service packs of the product, which would overwrite your changes.

### Customizing JavaScript

You can copy your own JavaScript file with extended JavaScript functionality into the directory `<mywebapp>/scripts`. This file must have the name *usernatunicscript.js*. Define your new functionality in this JavaScript file.

If a *usernatunicscript.js* is found when the server is started, it is read additionally to the JavaScript file *natunicscript.js*.

For the new JavaScript functionality to be executed, you may also need to [customize the XSLT file](#).

## Customizing XSLT

Make a copy of `<mywebapp>/WEB-INF/transuni.xml` and save it as `<mywebapp>/WEB-INF/usertransuni.xml`. Modify the XSL elements to your needs.

After making changes to `usertransuni.xml` user file, you have to restart the server so that your changes become effective. If a `usertransuni.xml` file is found when the server is started, it is read instead of the default XSLT file.

## Customizing Overwrite / Insert mode in Input fields

Up to NJX 9.1.1, Internet Explorer always used “overwrite” mode whereas all other browsers used “insert” mode. With NJX 9.1.2 this inconsistency was fixed. The default behavior is now “overwrite” mode for all browsers. This reflects the default behavior of Natural applications.

If you prefer “insert” mode, do the following:

1. Copy the file `WEB-INF/transuni.xml` to `WEB-INF/usertransuni.xml` – refer to the section [customize the XSLT file](#) above.
2. Open `usertransuni.xml` in a text editor. Search for the following line:

```
<xsl:attribute name="onkeypress">handleKeyPress(this.name, this);</xsl:attribute>
```

3. Remove this line and save the file.

## Packaging Customized Files in Natural for Ajax WAR Files

When using the *Deployment Wizard for Web Applications* of NaturalONE to deploy your Natural for Ajax `.war` file, you can automatically package a custom `usertransuni.xml` in the `.war` file for deployment:

- Add a `webconfig` directory to your NaturalONE project as described in the documentation *NaturalONE > Natural for Ajax > Deploying the Application > Content of the Sample webconfig Directory*.
- Copy your `usertransuni.xml` to the `webconfig/web-inf` folder of your NaturalONE project.

# 12

## Multi-Language Management

---

■ Writing Multi-Language Layouts .....	94
■ Creating the Translation File .....	95
■ Tools for Translating Text IDs .....	96
■ Tool for Creating Languages .....	96
■ Unicode .....	96

The multi-language management is responsible for changing the text IDs into strings that are presented to the user.

There are two translation aspects:

- All literals in the GUI definitions of a layout are replaced by strings which are language-specific.
- Literals you output within your adapter code (e.g. status messages) must be translated.

The multi-language management is internally kept cleanly behind an internal interface. This means that in the future a different implementation will be available to provide a solution to find a string for a given text ID. In this, the default implementation which simply uses comma separated value files is described.

The information provided in this is organized under the following headings:

## Writing Multi-Language Layouts

---

When defining properties of controls inside a layout definition, there are always two options to specify fix labels: either use property `name` or property `textid`. In case your pages support multi-language ability, you only have to use the `textid` property. At runtime, the corresponding labels are found in the following way:

- Each PAGE has the property `translationreference`. This property may be the name of the HTML file - or it may be a logical name, used by different HTML pages.
- Inside Application Designer, there are defined directories and files in which the text information is stored: each application project is represented by a directory under the web application directory of Application Designer. Inside the project directory, there is a directory `/multilanguage/`. Under this directory, each language is represented by its own directory, e.g. by the directory `/multilanguage/de/` for German translations.
- Inside each language directory, there is one comma separated value (CSV) file for each page name. The name of the file is `<pagename>.csv` (for example, `Login.csv`).
- Inside the CSV file, each line contains the text ID, a semicolon and the label text, e.g. "Label1;Login name".

- [Example](#)

## ■ Page Name Strategy

### Example

Let us assume you have defined an application project "accountmgmt". Inside the application project, there is a layout definition *account.xml* that points via the `translationreference` property of PAGE to "account". The file structure inside your application project directory now looks as follows:

```
<webapp-directory>/
  accountmgmt/
    account.html           // generated HTML file
    multilanguage/
      de/
        account.csv       // German text
      en/
        account.csv       // English text
    xml/
      account.xml         // layout definition
```

### Page Name Strategy

The previous section explained how a translation file is found for a certain HTML page. Basically, the translation reference is used to link the layout definition and the Application Designer multi-language management.

In general, there are two strategies for using this translation reference, and a mixture of both:

- Specify one central page name for a couple of pages. Therefore, all pages share the same multi-language information (i.e. the same *.csv* file).
- Specify one page name for each page. Therefore, every page has its own *.csv* file.

For larger projects, it makes sense to combine different literal information into one file - in order to keep consistency and to avoid redundancy. Of course, you have to synchronize the naming of text IDs for each page.

## Creating the Translation File

The translation file (*account.csv* in the [example](#) of the previous section) is a simple comma separated file with the following format:

```
textid1;text1  
textid2;text2  
textid3;text3
```

If your text itself contains a semicolon, then write "\;".

You can either create the file by using a text editor or you can use Application Designer's Literal Assistant which is integrated in the Layout Painter.

Pay attention: when using text editors of your own, you must configure your editor to store the text using UTF-8 character encoding. Otherwise, any characters that are not "ASCII characters < 128" will not be properly displayed. Make sure that your editor is UTF-8 capable.

## Tools for Translating Text IDs

---

There are two tools. One is the Literal Assistant that is part of the Layout Painter. The other is the Literal Translator.

## Tool for Creating Languages

---

Application Designer comes with two languages: "en" for English and "de" for German. When creating a new language abbreviation, you have to take care of the following:

- You have to create language directories in your projects.
- You have to copy certain files in which Application Designer holds text information that is language dependent.

The Language Manager automates the creation of language abbreviations.

## Unicode

---

Pay attention to the fact that Application Designer is fully based on Unicode and its UTF-8 format. All multi-language files must be in UTF-8 format. Especially pay attention when maintaining CSV files with programs like MS Excel.

# 13

## Starting a Natural Application with a URL

---

The connection parameters available in the configuration file for the session and on the logon page can also be specified as URL parameters of the logon page URL. This allows bookmarking the startup URL of a Natural application or starting an application by clicking a hyperlink in a document.

The URL parameters overrule the definitions in the configuration file, with the exception described in the table below.

The following URL parameters are available for the logon page:

URL Parameter	Corresponding Option in the Session Configuration
natsession	<b>Session ID</b>
natserver	<b>Host name</b>
natport	<b>Port number</b>
natuser	<b>User name</b>
natprog	<b>Application</b>
natparam	<b>Natural parameters</b>
natparamext	<b>Natural parameters</b>  The URL parameter <code>natparamext</code> extends an existing Natural parameter definition in the configuration file. The extension works in the following way: the Natural parameters defined in the configuration file come first. Then, the Natural parameters defined in the URL parameter <code>natparamext</code> are added, separated by a space character.  If you want to overrule the definition in the configuration file, use the URL parameter <code>natparam</code> instead.
nattimeout	<b>Timeout (n seconds)</b>

**Important:** All parameter values must be URL-encoded.

Example: In order to start the Natural program `dump` , while your application server is running on *myhost:8080* and your Natural Web I/O Interface server is running on *myserver1:4811* , you can use the following URL:

*`http://myhost:8080/natuniweb/natural.jsp?natserver=myserver1&natport=4811&natprog=dump&natuser=my-username`*

# 14

## Configuring Container-Managed Security

---

■ General Information .....	100
■ Name and Location of the Configuration File .....	100
■ Activating Security .....	100
■ Defining Security Constraints .....	101
■ Defining Roles .....	101
■ Selecting the Authentication Method .....	102
■ Configuring the UserDatabaseRealm .....	102

## General Information

---

The Natural Web I/O Interface client comes as a Java EE-based application. For the ease of installation, the access to this application is by default not secured. You might, however, wish to restrict the access to certain parts of the application to certain users. An important example is the **configuration tool**, which enables you to modify the Natural session definitions and the logging configuration of the Natural Web I/O Interface client. Another example is the Natural logon page.

This section does not cover the concepts of JAAS-based security in full extent. It provides, however, sufficient information to activate the preconfigured security settings of the Natural Web I/O Interface client and to adapt them to your requirements.

## Name and Location of the Configuration File

---

Security is configured in the file *web.xml*. This file is located in the following directory:

```
<tomcat-install-dir>/webapps/natuniweb/WEB-INF
```

## Activating Security

---

Great care must be taken when editing and changing the configuration file *web.xml*. After a change, the application server must be restarted.

Edit the file *web.xml* and look for the section that is commented with "Uncomment the next lines to add security constraints and roles.". Uncomment this section by removing the comment marks shown in boldface below:

```
<!-- Uncomment the next lines to add security constraints and roles. -->
<!--
<security-constraint>
  <web-resource-collection>
    <web-resource-name>Configuration Tool</web-resource-name>
    <url-pattern>/conf_index.jsp</url-pattern>
    <url-pattern>/faces/*</url-pattern>
  </web-resource-collection>
  ...
<security-role>
  <description>Administrator</description>
  <role-name>nwoadmin</role-name>
</security-role>
-->
```

## Defining Security Constraints

The security constraints defined by default are just examples. A `<security-constraint>` element contains a number of `<web-resource-collection>` elements combined with an `<auth-constraint>` element. The `<auth-constraint>` element contains a `<role-name>`. The whole `<security-constraint>` element describes which roles have access to the specified resources.

Example - the following definition specifies that only users in the role "nwoadmin" have access to the configuration tool:

```
<security-constraint>
  <web-resource-collection>
    <web-resource-name>Configuration Tool</web-resource-name>
    <url-pattern>/conf_index.jsp</url-pattern>
    <url-pattern>/faces/*</url-pattern>
  </web-resource-collection>
  <auth-constraint>
    <role-name>nwoadmin</role-name>
  </auth-constraint>
</security-constraint>
```

In the following section, you will see where and how the roles are defined.

## Defining Roles

A few lines below in the file *web.xml*, there is a section `<security-role>`. Here, the roles that can be used in `<security-constraint>` elements are defined. You can define additional roles as needed. The assignment of users to roles is done outside this file and will often be done in a user management that is already established at your site.

Example:

```
<security-role>
  <description>Administrator</description>
  <role-name>nwoadmin</role-name>
</security-role>
```

## Selecting the Authentication Method

---

In the file *web.xml*, there is a section `<login-config>`. The only element that should possibly be adapted here is `<auth-method>`. You can choose between the authentication methods "FORM" and "BASIC". Form-based authentication displays a specific page on which users who try to access a restricted resource can authenticate themselves. Basic authentication advises the web browser to retrieve the user credentials with its own dialog box.

Example:

```
<login-config>
  <auth-method>FORM</auth-method>
  ...
</login-config>
```

## Configuring the UserDatabaseRealm

---

In the *tomcat-users.xml* file (which is located in the *conf* directory), specify the role "nwoadmin" for any desired user name and password. For example:

```
<user username="pepe" password="pepe123" roles="nwoadmin"/>
```

For detailed information on the necessary realm configuration for Tomcat, see <http://tomcat.apache.org/tomcat-6.0-doc/realm-howto.html#UserDatabaseRealm>.

## Configuring SSL

---

■ General Information .....	104
■ Creating Your Own Trust File .....	104
■ Defining SSL Usage in the Configuration File .....	105

## General Information

---

Trust files are used for a secure connection between the Natural Web I/O Interface server and the Natural Web I/O Interface client . Server authentication cannot be switched off. A trust file is always required.

A trust file contains the certificates that you trust. These can be certificates of a CA (Certificate Authority) such as VeriSign, or self-signed certificates.

For information on the steps that are required on the Natural Web I/O Interface server and how to generate a self-signed certificate which needs to be imported to the client, see *SSL Support* .

To establish a secure connection, you have to proceed as described in the topics below.

## Creating Your Own Trust File

---

To create your own trust file, you can use, for example, Sun's keytool utility which can be found in the *bin* directory of the Java Runtime Environment (JRE). Here are some helpful examples:

- Create an empty, password-protected trust file:

```
keytool -genkey -alias foo -keystore truststore.jks -storepass "your-password"
keytool -delete -alias foo -keystore truststore.jks
```

- Import a certificate:

```
keytool -import -alias "name-for-ca" -keystore truststore.jks -storepass ↵
"your-password" -file server.cert.crt
```

You should use a meaningful name for the alias.

- List the certificates in a trust file:

```
keytool -list -v -keystore truststore.jks
```

- Delete a certificate from a trust file:

```
keytool -delete -alias "name-for-ca" -keystore truststore.jks
```

When you modify the trust file or its password, you have to restart the application server so that your modification takes effect.

## Defining SSL Usage in the Configuration File

---

Invoke the [configuration tool](#) and proceed as follows:

1. In the global settings for all defined sessions, define the **SSL trust file path** and, if required, the **SSL trust file password** . See also [Global Settings](#) in *Natural Client Configuration Tool* .

With the server authentication, the Natural Web I/O Interface client checks whether the certificate of the Natural Web I/O Interface server is known. If it is not known, the connection is rejected.

When a trust file is not defined in the configuration tool, the Natural Web I/O Interface client tries to read the file *calist* from the *lib/security* directory of the Java Runtime Environment (JRE). The default password for this file is "changeit" .

2. Define a session and set the session option **Use SSL** to **Yes** . See also [Overview of Session Options](#) in *Natural Client Configuration Tool* .

# 16

## Configuring Single Sign-On (SSO)

---

■ General Information .....	108
■ SSL/TLS Configuration .....	108
■ Configuring OpenID Connect Usage on the Client .....	109

## General Information

---

**Note:** Single Sign On is not supported by Natural for Mainframes.

Natural for Ajax supports SSO with OpenID Connect. OpenID Connect is now the leading standard for single sign-on on the Internet. The user authentication is delegated to a central Identity Provider (IdP) service. This can be a public IdP like Google and Microsoft or an enterprise internal IdP.

When starting a Natural for Ajax application, Natural for Ajax will redirect the user to the IdP. In case the user is already logged in at the IdP, no login screen will appear. If the user is not yet logged in at the IdP, the IdP will open a corresponding login dialog. For Natural for Ajax it is absolutely transparent how the users are authenticated, it is all up to the IdP. In case of a successful authentication, Natural for Ajax will receive a valid token from the IdP. This token is used for the login to the Natural server.

Prerequisite is a Natural server environment, which supports SSO with OpenID Connect. For the corresponding Natural versions and configuration requirements see the Natural documentation.

As described above, a token is used for the login to the Natural server. Among other information, the token contains claims about the user such as email. In the Natural for Ajax **Session Configuration** you need to specify which of the claims should be used as a Natural username. This claim must be included in the token. Therefore, you may also want to configure which claims should be part of the token. These include the claims Natural for Ajax should request from the IdP and the details for how Natural for Ajax should request the claims. You can configure all this in the global settings of the session configuration. For details about claims please see the list of [Standart Claims](#) and the documentation of your IdP.

## SSL/TLS Configuration

---

OpenID Connect requires the usage of SSL/TLS. You must provide a trustfile with a valid certificate for the connection between the Natural for Ajax client and the Natural Web I/O Interface server as described in the [Configuring SSL](#) documentation.

For OpenID Connect, you must also put the certificate of your IdP into the same trustfile.

## Configuring OpenID Connect Usage on the Client

---

### To configure the OpenID Connect:

1. Invoke the Natural for Ajax runtime tools and choose **Session Configuration**.
2. Define the OpenID Connect settings for your IdP in the global settings for all defined sessions.

You can only configure one IdP per Natural for Ajax application but the single sessions may be a mix of sessions which use OpenID Connect and sessions which don't use OpenID Connect.

### To enable OpenID Connect for a single session:

1. Switch on **SSL** in the **Natural Connection** tab.
2. Switch on **OpenID Connect (OIDC)** in the **Authentication** tab.

### Configuring your Identity Provider (IdP)

Your IdP requires you to set valid redirect URIs for your application. These are the allowed URIs to which a browser can redirect after a successful login at the IdP. In case the URI for your web application is `https://mywebapplication` you need to set the following URIs as valid redirect URIs in your IdP:

- `https://mywebapplication/servlet/OpenidConnectRequest`
- `https://mywebapplication/servlet/OpenidConnectRequest?subpage=true`

When using the Natural for Ajax subpage or workplace functionality, you also need to allow the following CORS origin in your IdP:

*`https://mywebapplication`*

## Logging

---

■ General Information .....	112
■ Name and Location of the Configuration File .....	112
■ Invoking the Logging Configuration Page .....	112
■ Overview of Options for the Output File .....	114

## General Information

---

The Natural Web I/O Interface client uses the Java Logging API. In case of problems with the Natural Web I/O Interface client, you can enable logging and thus write the logging information to an output file. This should only be done when requested by Software AG support.

You configure logging using the [configuration tool](#).

**Note:** Some logging information is also written to the console, regardless of the settings in the configuration file. The console shows the information which is normally provided by the logging levels SEVERE, WARNING and INFO.

## Name and Location of the Configuration File

---

The name of the configuration file is *natlogger.xml*, which is located in: .

`<application-server-install-dir> server/default/deploy/naturalunicode.rar/log`

## Invoking the Logging Configuration Page

---

The content of the configuration file *natlogger.xml* is managed using the **Logging Configuration** page of the [configuration tool](#).

➤ **To invoke the Logging Configuration page**

- 1 In the frame on the left, choose the **Logging Configuration** link.

The **Logging Configuration** page appears in the right frame. Example:

### Logging Configuration

Specify the output log file characteristics.

- `"/"` : The local pathname separator
- `"%t"`: The system temporary directory
- `"%h"`: The value of the "user.home" system property
- `"%g"`: The generation number to distinguish rotated logs
- `"%u"`: A unique number to resolve conflicts
- `"%%"`: Translates to a single percent sign `"%"`

File pattern name:

File type:

File size (in Kbytes; 0=unlimited):

Number of files:

File enabled: ☒ Yes ☐ No

Append mode: ☐ Yes ☒ No

Specify log levels for individual modules. The available settings are:

- SEVERE: Events that interfere with normal program execution
- WARNING: Warnings, including exceptions
- INFO: Messages related to server configuration or server status, excluding errors
- CONFIG: Messages related to server configuration
- FINE: Minimal verbosity
- FINER: Moderate verbosity
- FINEST: Maximum verbosity

Communication:

Resource adapter:

Session beans:

Message beans:

Configuration file:

Logging:

Utilities:

Natural Web I/O Interface pages:

- 2 Specify the characteristics of the output file as described below in the section [Overview of Options for the Output File](#) .
- 3 Specify the log levels for individual modules by selecting the log level from the corresponding drop-down list box.

A brief description for each log level is provided on the **Logging Configuration** page.

- 4 Choose the **Save Configuration** button to write the modifications to the configuration file.

**Caution:** When you do not choose the **Save Configuration** button but log out instead or leave the configuration tool by entering another URL, your modifications are not written to the configuration file.

## Overview of Options for the Output File

---

The following options are provided for specifying the characteristics of the output file:

Option	Description
<b>File pattern name</b>	<p>The pattern for generating the output file name. Default: "%h/nwolog%g.log" .</p> <p>The default value means that an output file with the name <i>nwolog &lt;number&gt; .log</i> will be created in the home directory of the user who has started the application server.</p> <p>For detailed information on how to specify the pattern, see the Java API documentation .</p>
<b>File type</b>	<p>The format of the output file. Select one of the following entries from the drop-down list box:</p> <ul style="list-style-type: none"><li>■ <b>Text format</b> Output in simple text format (default).</li><li>■ <b>XML format</b> Output in XML format.</li></ul> <p>The corresponding formatter class is then used.</p>
<b>File size</b>	<p>The maximum number of bytes that is to be written to an output file. Zero (0) means that there is no limit. Default: "0" .</p>
<b>Number of files</b>	<p>The number of output files to be used. This value must be at least "1" . Default: "10" .</p>
<b>File enabled</b>	<p>If set to <b>Yes</b> (default), the file handler is enabled. If set to <b>No</b> , the file handler is disabled.</p>
<b>Append mode</b>	<p>If set to <b>Yes</b> , the logging information is appended to the existing output file. If set to <b>No</b> (default), the logging information is written to a new output file.</p>
