---

## Preface

---

This documentation describes the common specifications for the Natural Construct models and how to perform common development tasks. It is organized under the following headings:

<b>Common Fields on the Standard Parameters Panel</b>	Describes the common fields on the Standard Parameters panel.
<b>Set Up a Password File</b>	Describes how to set up a password file to implement password checking for generated modules.
<b>Change the Default Window Settings</b>	Describes how to change the default window settings for your generated modules, such as the size and position of the window and whether it uses a frame (border). Includes information on testing the new window settings.
<b>Determine Which Condition Codes are Set</b>	Explains how to verify which condition codes have been set for your generated module.

### Notes:

1. Although the screen examples used in this documentation are from a mainframe environment, the information applies to all server environments.
2. For information about the additional specification panels for a specific model, see the documentation in which that model is described.

---

# 1

## About this Documentation

---

■ Document Conventions .....	2
■ Online Information and Support .....	2
■ Data Protection .....	3

## Document Conventions

---

Convention	Description
<b>Bold</b>	Identifies elements on a screen.
Monospace font	Identifies service names and locations in the format <i>folder.subfolder.service</i> , APIs, Java classes, methods, properties.
<i>Italic</i>	Identifies:  Variables for which you must supply values specific to your own situation or environment. New terms the first time they occur in the text. References to other documentation sources.
Monospace font	Identifies:  Text you must type in. Messages displayed by the system. Program code.
{ }	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the   symbol.
[ ]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [ ] symbols.
...	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...).

## Online Information and Support

---

### Product Documentation

You can find the product documentation on our documentation website at <https://documentation.softwareag.com>.

In addition, you can also access the cloud product documentation via <https://www.software-ag.cloud>. Navigate to the desired product and then, depending on your solution, go to “Developer Center”, “User Center” or “Documentation”.

### Product Training

You can find helpful product training material on our Learning Portal at <https://knowledge.softwareag.com>.

## Tech Community

You can collaborate with Software AG experts on our Tech Community website at <https://tech-community.softwareag.com>. From here you can, for example:

- Browse through our vast knowledge base.
- Ask questions and find answers in our discussion forums.
- Get the latest Software AG news and announcements.
- Explore our communities.
- Go to our public GitHub and Docker repositories at <https://github.com/softwareag> and <https://hub.docker.com/publishers/softwareag> and discover additional Software AG resources.

## Product Support

Support for Software AG products is provided to licensed customers via our Empower Portal at <https://empower.softwareag.com>. Many services on this portal require that you have an account. If you do not yet have one, you can request it at <https://empower.softwareag.com/register>. Once you have an account, you can, for example:

- Download products, updates and fixes.
- Search the Knowledge Center for technical information and tips.
- Subscribe to early warnings and critical alerts.
- Open and update support incidents.
- Add product feature requests.

## Data Protection

---

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

## 2 Common Fields on the Standard Parameters Panel

---

The Standard Parameters panel is similar for all program models; it is the first and sometimes the only specification panel. The following example shows the Standard Parameters panel for the Object-Maint-Dialog model:

CUOMMA Sep 16	Object-Maint-Dialog Program Standard Parameters	CU--MA0 1 of 4
Module ..... _____		
System ..... CST82S_____		
Global data area ... CDGDA___ *		
With block ..... _____		
Title ..... Object Dialog..._____		
Description ..... This program is used to maintain the..._____		
_____		
_____		
_____		
First header ..... _____		
Second header ..... _____		
Command ..... _		
Message numbers .... _		
Password ..... _		
Enter-PF1---PF2---PF3---PF4---PF5---PF6---PF7---PF8---PF9---PF10--PF11--PF12---		
right help retrn quit		right main

**Note:** The Standard Parameters panel for other models may not contain all the fields shown.

The fields on the Standard Parameters panel include:

Field	Description
Module	<p>Name of the module (by default, the name specified in the Module name field on the Generation main menu). This is a required field.</p> <p>The module name must be alphanumeric, a maximum of eight characters in length, and cannot contain blanks.</p>
System	<p>Name of the system (by default, the name of the current library). This is a required field.</p> <p>The system name must be alphanumeric, not exceed 32 characters in length, and does not have to be associated with a Natural library ID. (The combination of the module name and system name is used as a key to access help information for the generated module.)</p>
Global data area	<p>Name of the global data area (GDA) used by the generated module. By default, CDGDA is displayed. This is a required field.</p> <p>To allow inter-program communication, generated modules require a small number of global variables. The CDGDA global data area contains the global variables required to test a generated module.</p> <p>Before creating a new application, copy this GDA from the SYSTEM library and rename it to match your naming conventions. Then add any additional global variables your application may require.</p>
With block	<p>Name of the GDA block used by the generated module. This is an optional field.</p> <p>To use a GDA block, you need only specify the lowest level block name; the corresponding path name is determined automatically. For more information about GDA blocks, see the Natural documentation.</p>
Title	Title for the generated module. The title is used internally to identify modules for the List Generated Modules function on the Generation main menu. This is a required field.
Description	Brief description of what the generated module does. This is an optional field and is used internally for documentation purposes.
First header	First header (heading) for the generated module. This header is centered at the top of the generated panel and intensified. This is a required field.
Second header	Second header (heading) for the generated module. This header is centered under the first header and intensified. This is an optional field.
Command	If this field is marked, the generated module supports direct command processing. If this field is blank, the generated module does not support direct commands.
Message numbers	<p>If this field is marked, the generated module uses message numbers rather than message text for all REINPUT and INPUT messages.</p> <p><b>Note:</b> Use the same technique consistently throughout your application, since passing messages between modules using different techniques will not always produce the desired results.</p>

Field	Description
Password	<p>If this field is marked, the generated module performs password checking. If this field is blank, the generated module does not perform password checking.</p> <p>To include password checking, you must set up a password file. For information, see <a href="#">Set Up a Password File</a>.</p>

## 3 Set Up a Password File

---

You can specify password checking for many of the generated modules. Natural Construct builds the mechanism for password checking into your module by including the CCPASSW copycode member. Within this copycode, the CDPASSW subprogram is invoked and passed the module and system names.

To include password checking, you must set up a password file. The file is keyed on the module name used to catalog the module and the system name used to generate the module.

The password file can be a view of any file with Natural-Construct-Password as the data definition module name. The view must contain the following fields:

Field	Format
PASSWORD-KEY	A40 (32-character system name, plus an 8-character module name)
PASSWORD	A8 (8-character password)

When a user attempts to invoke the module, the CDPASSW subprogram reads the password file. If the module/system name combination exists in the file and does not have a password, the user can invoke the module. If the module/system name combination exists and has a password, the user must enter the correct password before the module is invoked. If a user enters five incorrect passwords, execution is aborted.

If you specify password checking, you must modify the CDPASSW subprogram to include a valid password view and any final processing you want to perform and then catalog the modified subprogram. For more specific password checking, you can modify the CCPASSW copycode member (to call a different subprogram) or modify the CDPASSW subprogram (to refine your security standards).

# 4

## Change the Default Window Settings

---

■ Test the Modified Window Settings .....	13
---	----

> To change the default window settings for your generated module

1 Press PF5 (windw).

The Window Parameters window is displayed. For example:

```
CU--DWM      Natural Construct      CU--DWM0
Oct 21        Window Parameters      1 of 1

      Size ..... Height ..... ____
                        Width ..... ____

      Position ..... Line ..... ____
                        Column ..... ____

      Frame OFF .... _
Enter-PF1---PF2---PF3---PF4---PF5---PF6---PF7---PF8---
      help retrn quit test
```

2 Use the following fields to build the DEFINE WINDOW statement:

Field	Description
Size	<div><div>■ Height</div><div>Number of lines the window spans.</div><div>■ Width</div><div>Number of columns the window spans.</div></div>
Position	<div><div>■ Line</div><div>Number of lines from the top of the panel to the top of the window.</div><div>■ Column</div><div>Number of columns from the left side of the panel to the left side of the window. The line and column values form the top left corner of the window.</div></div>
Frame OFF	If this field is marked, the window is displayed without a border (frame).

3 Press Enter to confirm the changes.

## Test the Modified Window Settings

---

You can view a test version of the window with the characteristics specified in the Window Parameters window.

➤ **To test the modified window settings**

- Press PF4 (test) in the Window Parameters window.

# 5

## Determine Which Condition Codes are Set

### ➤ To determine which condition codes are set

- 1 Mark the `Condition codes` field in the `Optional Parameters` window.
- 2 Press PF2 (retrn).

The `Generation` main menu is displayed.

- 3 Generate the module.

After generation is complete, the `Condition Codes Trace` window is displayed, showing the condition codes set for the current module. For example:

CSGCTRAC		Natural Construct		CSGCTRC0	
Jan 13		Condition codes Trace		1 of 1	
Condition codes		Condition codes			
-----		-----			
1	X MULTIPLE-ENTITIES	14	DB2-TIMESTAMP		
2	X KEY-NOT-DEFINED-AS-UQ	15	CONFINED-KEY-PREFIX		
3	KEY-IS-ALPHA	16	RESET-REDEFINES		
4	KEY-IS-LOGICAL	17	LOGGING-UPDATES		
5	HOLD-FIELD-EQ-TIME	18	DB2-REFERENTIAL-INTEGRITY		
6	X PRIME-FILE-IS-ADABAS	19	DB2-INTRA-CASCADE-DELETE		
7	PRIME-FILE-IS-DB2	20	KEY-IS-REDEFINED		
8	CLAUSE-IS-DB2-SPECIFIC	21	DERIVED-DATA		
9	PRIME-FILE-IS-IMS	22	NAT-REFACTORING		
10	PRIME-FILE-IS-VSAM	23	X GET-BY-ISN		
11	KEY-IS-A-SUPER	24	X HASH-LOCKING		
12	X USE-MSG-NR	25	NAT4-OR-HIGHER		
13	KEY-IS-PRIME				

**Tip:** If the condition code is not marked, ensure that the code is being generated in a Natural V4 (Natural V6 on open systems) or higher environment and that the option is set to True

in the CSXDEFLT subprogram. CSXDEFLT is installed in the SYSCSTX library. To use the code, compile the subprogram in the SYSCST library and then copy the object code to the SYSLIBS library. For information on CSXDEFLT, see *Use CSXDEFLT Overrides* in *Natural Construct Administration and Modeling*.
