

Tracing

This chapter covers the following topics:

- About the Tracing Tools
 - Recording a Performance Trace
 - Executing a Performance Trace
-

About the Tracing Tools

The tracing tools can be used to test the performance of a web application. First, you record a performance trace (that is, your interaction with the server), and then you execute the recorded performance trace in order to determine the amount of time that is required for processing the server requests.

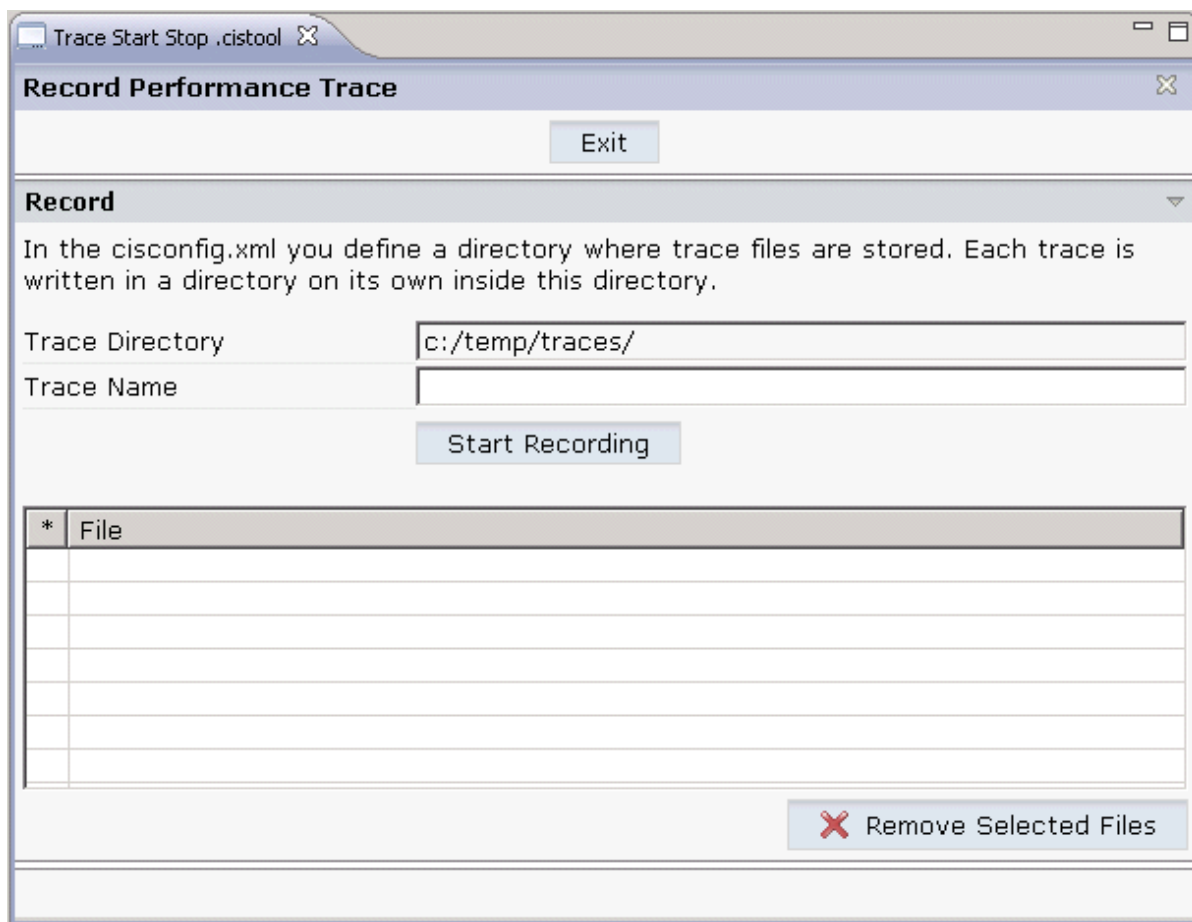

Recording a Performance Trace

Performance traces are recorded using the **Trace Start/Stop** command.

To record a performance trace

1. In the **Navigator** view, select the project for which you want to record a performance trace.
2. Invoke the context menu and from the **Ajax Developer** menu, choose **Trace Start/Stop**.

The following editor appears.

The **Trace Directory** text box indicates the directory in which the traces will be stored. The name of this directory is defined in the file *cisconfig.xml*.

Each trace is written into a separate subdirectory of the trace directory. The name of the subdirectory is determined by your specification in the **Trace Name** text box.

Note:

Make sure that the trace directory is available at the specified location. Otherwise, traces will not be written.

3. Enter the name of a subdirectory in the **Trace Name** text box.
4. Choose the **Start Recording** button.

Additional information is now shown in the editor.

Record

In the cisconfig.xml you define a directory where trace files are stored. Each trace is written in a directory on its own inside this directory.

Trace Directory: c:/temp/traces/

Trace Name: MyTrace

Stop Recording

Next Request's Comment: [] Set

5. In the **Next Request's Comment** text box, enter a comment name for the current trace.

Using comment names, you can subdivide the trace into several sections. The comment name is used in the names of the files that are created for your server requests (see below).

6. Choose the **Set** button.

The comment name that you specified is shown below the **Next Request's Comment** text box.

7. Initiate an interaction with the server.

For example, open the Layout Painter, and then return to the trace editor.

All requests (interactions with the server) that you initiate are recorded.

8. Choose the **Stop Recording** button.

The files that have been created for your requests are shown in the dialog. The comment name that you specified is part of the file name.

Start Recording

* File
<input type="checkbox"/> R0006_MyComment.request
<input type="checkbox"/> R0007_MyComment.request
<input type="checkbox"/> R0008_MyComment.request
<input type="checkbox"/> R0009_MyComment.request

Remove Selected Files

If you want to remove one or more files from the list, select the file(s) and choose the **Remove Selected Files** button.

You can add further requests to this trace by repeating the above steps.

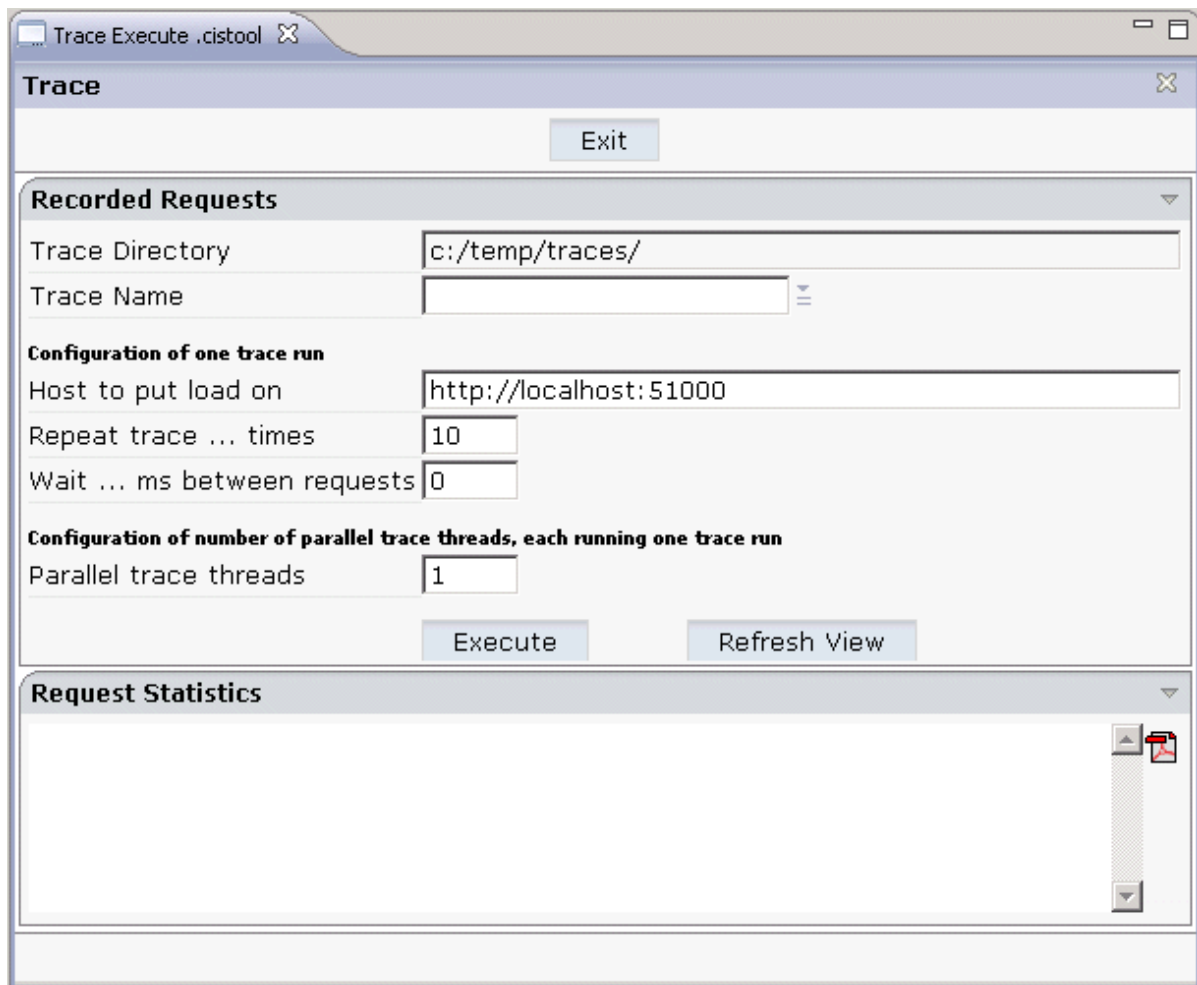

Executing a Performance Trace

Recorded performance traces are executed using the **Trace Execute** command.

▶ To execute a performance trace

1. In the **Navigator** view, select the project for which you want to execute a performance trace.
2. Invoke the context menu and from the **Ajax Developer** menu, choose **Trace Execute**.

The following editor appears.

The **Trace Directory** text box indicates the directory in which the tool looks for the recorded traces.

3. Specify the following information:

Trace Name

Select the name of the subdirectory which contains the recorded traces for your server requests.

Host to put load on

Enter the URL of the host on which you want to execute the trace.

Repeat trace ... times

Enter the number of times that the trace is to be repeated.

For all defined repetitions, the average process time (in milliseconds) will be shown in the request statistics (see below). The more repetitions you define, the more conclusive is the resulting average value.

Wait ... ms between requests

Enter the waiting time between the requests in milliseconds.

Parallel trace threads

Enter the number of parallel trace threads. This simulates the number of users that access the web application at the same time.

4. Choose the **Execute** button.
5. Choose the **Refresh View** button to display the request statistics at the bottom of the dialog.

Information on the requests is now shown in the **Request Statistics** section:

Request Statistics						
Trace Threads						
Working			Finished			
1			0			
Overview						
Request	Calls	OK	ERR	Duration	Min	Max
Trace file name: c:/temp/traces//MyTrace/traceresults_20090911173928292.csv						

The first small table indicates the current number of unfinished and finished trace threads.

The second table provides a statistical evaluation of the executed requests. The following information is provided for each request: the number of calls, the number of successful executions, the number of errors, the average process time for all calls (duration), the minimum process time for a call, and the maximum process time for a call. The times are given in milliseconds.

In the case of an error, an additional table is shown which provides details on the error.

You can choose the following button in the **Request Statistics** section to display the request statistics in PDF:

The trace result is stored in a CSV file. The path to this file is indicated at the bottom of the dialog.
