

Image Control

The CISFO:IMAGE2 control outputs an image. Use property `image` to enter the image's URL in a static way. In order to derive the URL at runtime, use property `valueprop`. In both cases, the URL can either be relative (URL points to an image that is kept within your web application) or absolute (absolute directory path). Do not use absolute URLs if you plan to deploy your web application within a cluster.

The Application Designer demo workplace contains a demo on image URLs. Choose **Release 1.3.0** and then **CISFO2 Image include**. You can call the development workplace via the following link (standard installation):

<http://localhost:51000/cis/HTMLBasedGUI/workplace/demo.html>

Properties

Basic			
<code>image</code>	The URL of the image.	Optional	
<code>valueprop</code>	The name of the property from that the URL is derived at runtime.	Optional	
<code>width</code>	The width of the image control.	Optional	1pt 12pt 0.5in 1in 1mm 5mm 1cm 1.5cm
<code>height</code>	The height of the image control.	Optional	1pt 12pt 0.5in 1in 1mm 5mm 1cm 1.5cm
