# 1 About this Documentation

Document Conventions	. 2
Online Information and Support	
Data Protection	

### **Document Conventions**

Convention	Description
Bold	Identifies elements on a screen.
Monospace font	Identifies service names and locations in the format folder.subfolder.service, APIs, Java classes, methods, properties.
Italic	Identifies:  Variables for which you must supply values specific to your own situation or environment.  New terms the first time they occur in the text.
	References to other documentation sources.
Monospace font	Identifies:  Text you must type in.  Messages displayed by the system.  Program code.
{}	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
I	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the   symbol.
[]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [] symbols.
	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis ().

# **Online Information and Support**

#### **Product Documentation**

You can find the product documentation on our documentation website at <a href="https://documentation.softwareag.com">https://documentation.softwareag.com</a>.

In addition, you can also access the cloud product documentation via <a href="https://www.software-ag.cloud">https://www.software-ag.cloud</a>. Navigate to the desired product and then, depending on your solution, go to "Developer Center", "User Center" or "Documentation".

#### **Product Training**

You can find helpful product training material on our Learning Portal at <a href="https://knowledge.soft-wareag.com">https://knowledge.soft-wareag.com</a>.

#### **Tech Community**

You can collaborate with Software AG experts on our Tech Community website at <a href="https://tech-community.softwareag.com">https://tech-community.softwareag.com</a>. From here you can, for example:

- Browse through our vast knowledge base.
- Ask questions and find answers in our discussion forums.
- Get the latest Software AG news and announcements.
- Explore our communities.
- Go to our public GitHub and Docker repositories at https://github.com/softwareag and https://hub.docker.com/publishers/softwareag and discover additional Software AG resources.

#### **Product Support**

Support for Software AG products is provided to licensed customers via our Empower Portal at <a href="https://empower.softwareag.com">https://empower.softwareag.com</a>. Many services on this portal require that you have an account. If you do not yet have one, you can request it at <a href="https://empower.softwareag.com/register">https://empower.softwareag.com/register</a>. Once you have an account, you can, for example:

- Download products, updates and fixes.
- Search the Knowledge Center for technical information and tips.
- Subscribe to early warnings and critical alerts.
- Open and update support incidents.
- Add product feature requests.

#### **Data Protection**

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

# 2 Setting up Broker Instances

Setting up TCP/IP Transport	6
Running Broker with SSL/TLS Transport	
Setting up Entire Net-Work/Adabas SVC Transport	
Starting and Stopping the Broker	
Tracing EntireX Broker	9
Protecting a Broker against Denial-of-Service Attacks	11

This chapter contains information on setting up the Broker under z/VSE. It assumes that you have completed the relevant steps described under *Installing EntireX under z/VSE*.

## **Setting up TCP/IP Transport**

The recommended way to set up the TCP/IP communicator is to define PORT=nnnn and optionally HOST=x.x.x.x| hos  $t_name$  under TCP/IP-specific Attributes.

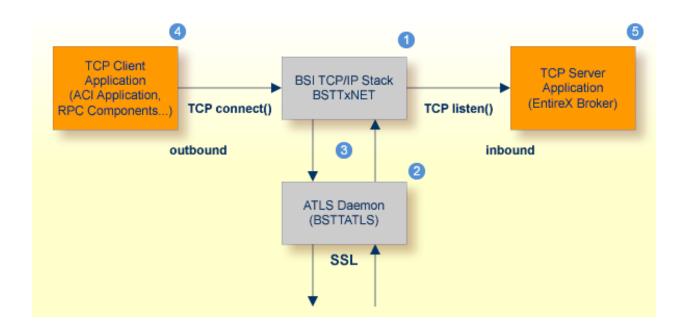

However, if no port number is specified in the broker attribute file, the broker kernel will use default port number of 1971. This is the same default port number that the stubs use.

# **Running Broker with SSL/TLS Transport**

Establishing an SSL connection on z/VSE requires BSI's Automatic Transport Layer Security (ATLS). This is a facility similar to Application Transparent - Transport Layer Security (AT-TLS) under z/OS. ATLS is supported by the BSI stack only. Together with SSL parameters (to provide certificates), define ATLS rules for socket interception in the ATLS daemon startup job BSTTATLS 2. If the rules match, the socket connection is turned into an SSL connection. Refer to your IBM documentation for further information. For an overview, refer to the IBM Redbook *Enhanced Networking on IBM z/VSE*; for a more detailed description, refer to *BSI SSL Installation, Programming and User's Guide*.

The figure below illustrates client and server TCP communication:

- EntireX applications including RPC servers act as TCP clients, establishing TCP outbound connections
- EntireX Broker acts as a TCP server, establishing a TCP inbound connection

- 1 BSI TCP/IP Stack, either BSTTINET (IPv4) or BSTT6NET (IPv6).
- 2 Automatic Transport Layer Security daemon (BSTTATLS) intercepts inbound and outbound TCP connections and converts them to SSL connections.
- 3 BSTTATLS is associated with the BSI TCP/IP stack.
- 4 A client application using a TCP connection.
- **6** A server application using a TCP connection.

#### Sample ATLS Daemon Configuration

```
* Converting inbound EntireX Broker connection

* Converts listen port 1971 to SSL listen port 1972
OPTION SERVER
ATTLS 1971 AS 2071 SSL

* Converting outbound client connection

* Converts connect to 192.168.2.100:1972:TCP to 192.168.2.100:2072:SSL
OPTION CLIENT
ATTLS 1972 TO 192.168.2.100 AS 2072 SSL
```

**Note:** We recommend setting SETPARM value SUBTASK to a value greater than 0 in the ATLS daemon startup job (valid values 0-16, default=0). For example:

#### // SETPARM SUBTASK=8

See also BSI SSL Installation, Programming and User's Guide.

For additional information see also *Using the BSI TCP/IP Stack* under *Hints for Setting up Broker JCL in z/VSE* in the z/VSE Installation documentation and *SSL/TLS and Certificates with EntireX*.

## **Setting up Entire Net-Work/Adabas SVC Transport**

#### To set up EntireX Net-Work communication mechanism

- Ensure that appropriate values are supplied in the broker attribute file section DEFAULTS=NET, paying particular attention to the IUBL parameter which specifies the maximum send/receive buffer length that can be sent between an application and Broker kernel within a single request and NABS, which governs the total amount of storage available concurrently for all users communicating over this transport mechanism. See *Adabas SVC/Entire Net-Work-specific Attributes*.
- 2 Ensure that communication with the broker is possible by running the installation verification programs (BCOC, BCOS) using transport type NET. See *Verifying the Installation of the Broker* in the z/VSE Installation documentation.

## Starting and Stopping the Broker

#### Starting the Broker

#### > To start the broker

■ Run job RUNETB.J.

If the UPSI bit is not set (see Broker installation step *Step 4: Customize the EntireX Broker Startup Job Control (RUNETB. J)*) you will be prompted on the console with following message: Broker V9.6.0.00 ready for communication: ETB00001.

#### Stopping the Broker

#### > To stop the broker

■ Use the following console command:

```
task_id ETBSTOP
```

If the console prompt is suppressed, enter an MSG command before the console command:

MSG partition\_id

## **Tracing EntireX Broker**

This section covers the following topics:

- Broker TRACE-LEVEL Attribute
- Attribute File Trace Setting
- Deferred Tracing
- Dynamically Switching On or Off the EntireX Broker Trace

#### **Broker TRACE-LEVEL Attribute**

The Broker TRACE-LEVEL attribute determines the level of tracing to be performed while Broker is running. The Broker has a master TRACE-LEVEL specified in the Broker section of the attribute file as well as several individual TRACE-LEVEL settings that are specified in the following sections of the attribute file.

Individual Settings	Specified in Attribute File Section	Note
Master trace level	DEFAULTS=BROKER	1,2
Conversion trace level	DEFAULTS=SERVICE; Trace option of the service-specific broker attribute CONVERSION.	
Security trace level	DEFAULTS=SECURITY	1
Transport trace level	DEFAULTS=NET   TCP	1
Application Monitoring trace level	DEFAULTS=APPLICATION-MONITORING	

#### Notes:

1. For temporary changes to the master or individual TRACE-LEVEL without restarting the Broker, use the Broker command-line utility ETBCMD.

2. For temporary changes to the master TRACE-LEVEL without restarting the broker, use operator command TRACE.

#### **Attribute File Trace Setting**

Trace Level	Description
0	No tracing. Default value.
1	Traces incoming requests, outgoing replies, and resource usage.
2	All of Trace Level 1, plus all main routines executed.
3	All of Trace Level 2, plus all routines executed.
4	All of Trace Level 3, plus Broker ACI control block displays.

Note: Trace levels 2 and above should be used only when requested by Software AG support.

#### **Deferred Tracing**

It is not always convenient to run with TRACE-LEVEL defined, especially when higher trace levels are involved. Deferred tracing is triggered when a specific condition occurs, such as an ACI response code or a broker subtask abend. Such conditions cause the contents of the trace buffer to be written, showing trace information leading up the specified event. If the specified event does not occur, the Broker trace will contain only startup and shutdown information (equivalent to TRACE-LEVEL=0). Operating the trace in this mode requires the following additional attributes in the broker section of the attribute file. Values for TRBUFNUM and TRAP-ERROR are only examples.

Attribute	Value	Description
TRBUFNUM	3	Specifies the deferred trace buffer size = 3 * 64 K.
TRMODE	WRAP	Indicates trace is not written until an event occurs.
TRAP-ERROR	322	Assigns the event ACI response code 00780322 "PSI: UPDATE failed".

#### Dynamically Switching On or Off the EntireX Broker Trace

The following methods are available to switch on or off the EntireX Broker trace dynamically. You do not need to restart the broker for the changes to take effect.

#### ■ ETBCMD

Run command utility ETBCMD with option -c TRACE-ON or - c TRACE-OFF. See ETBCMD.

## Protecting a Broker against Denial-of-Service Attacks

An optional feature of EntireX Broker is available to protect a broker running with SECURITY=YES against denial-of-service attacks. An application that is running with invalid user credentials will get a security response code. However, if the process is doing this in a processing loop, the whole system could be affected. If PARTICIPANT-BLACKLIST is set to YES, EntireX Broker maintains a blacklist to handle such "attacks". If an application causes ten consecutive security class error codes within 30 seconds, the blacklist handler puts the participant on the blacklist. All subsequent requests from this participant are blocked until the BLACKLIST-PENALTY-TIME has elapsed.

#### Server Shutdown Use Case

Here is a scenario illustrating another use of this feature that is not security-related.

An RPC server is to be shut down immediately, using Broker Command and Information Services (CIS), and has no active request in the broker. The shutdown results in the LOGOFF of the server. The next request that the server receives will probably result in message 00020002 "User does not exist", which will cause the server to reinitialize itself. It was not possible to inform the server that shutdown was meant to be performed.

With the *blacklist*, this is now possible. As long as the blacklist is not switched off, when a server is shut down immediately using CIS and when there is no active request in the broker, a marker is set in the blacklist. When the next request is received, this marker results in message 00100050 "Shutdown IMMED required", which means that the server is always informed of the shutdown.

# 3 Broker Attributes

Name and Location of Attribute File	
Attribute Syntax	
Broker-specific Attributes	
Service-specific Attributes	
Codepage-specific Attributes	48
Adabas SVC/Entire Net-Work-specific Attributes	
Security-specific Attributes	
■ TCP/IP-specific Attributes	
c-tree-specific Attributes	
SSL/TLS-specific Attributes	65
■ DIV-specific Attributes	
Adabas-specific Attributes	73
Application Monitoring-specific Attributes	75
Authorization Rule-specific Attributes	76
■ Variable Definition File	77

**Note:** This section lists all EntireX Broker parameters. Not all parameters are applicable to all supported operating systems.

The Broker attribute file contains a series of parameters (attributes) that control the availability and characteristics of clients and servers, as well as of the Broker itself. You can customize the Broker environment by modifying the attribute settings.

#### Name and Location of Attribute File

The name and location of the broker attribute file is platform-dependent.

Platform	File Name/Location
z/VSE	Library member ETBnnn.ATR, where nnn is a placeholder specifying the broker instance (e.g. nnn=
	the assigned broker ID).

### **Attribute Syntax**

Each entry in the attribute file has the format:

#### ATTRIBUTE-NAME=value

The following rules and restrictions apply:

- A line can contain multiple entries separated by commas.
- Attribute names can be entered in mixed upper and lowercase.
- Spaces between attribute names, values and separators are ignored.
- Spaces in the attribute names are not allowed.
- Commas and equal signs are not allowed in value notations.
- Lines starting with an asterisk (\*) are treated as comment lines. Within a line, characters following an \* or # sign are also treated as comments.
- The CLASS keyword must be the first keyword in a service definition.
- Multiple services can be included in a single service definition section. The attribute settings will apply to all services defined in the section.
- Attributes specified after the service definition (CLASS, SERVER, SERVICE *keywords*) overwrite the default characteristics for the service.
- Attribute values can contain variables of the form \${variable name} or \$variable name:
  - Due to variations in EBCDIC codepages, braces should only be used on ASCII (UNIX or Windows) platforms or EBCDIC platforms using the IBM-1047 (US) codepage.
  - The variable name can contain only alphanumeric characters and the underscore ( ) character.
  - The first non-alphanumeric or underscore character terminates the variable name.
  - Under UNIX and Windows, the string \${variable name} is replaced with the value of the corresponding environment variable.

- On z/OS, variable values are read from a file defined by the DD name ETBVARS. The syntax of this file is the same as the attribute file.
- If a variable has no value: if the variable name is enclosed in braces, error 00210594 is given, otherwise \$variable name will be used as the variable value.
- If you encounter problems with braces (and this is quite possible in a z/OS environment), we suggest you omit the braces.

## **Broker-specific Attributes**

The broker-specific attribute section begins with the keyword <code>DEFAULTS=BROKER</code>. It contains attributes that apply to the broker. At startup time, the attributes are read and duplicate or missing values are treated as errors. When an error occurs, the broker stops execution until the problem is corrected.

**Tip:** To avoid resource shortages for your applications, be sure to specify sufficiently large values for the broker attributes that define the global resources.

		Opt/	Operating System						
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000		
ABEND-LOOP-DETECTION	YES I NO	0	Z	u	W	v	b		
	YES Stop broker if a task terminates abnormally twice, that is, the same abend reason at the same abend location already occurred. This attribute prevents an infinite abend loop.								
	NO Use only if requested by Software AG Support. This setting may make sense if a known error leads to an abnormal termination, but a hotfix solving the problem has not yet been provided. Reset to YES when the hotfix has been installed.								
ABEND-MEMORY-DUMP	YES I NO	0	z	u	w	v	b		
	<ul><li>YES Print all data pools of the broker if a task terminates abnormally. This dump is needed to analyze the abend.</li><li>NO If the dump has already been sent to Software AG, you can set to NO to avoid the extra overhead.</li></ul>								
ACCOUNTING	<u>NO</u> I 128-255	0	z						
	NO YES[SEPARATOR=char]	O		u	w	v	b		
	Determines whether accounting records are created.  NO Do not create accounting records.								
	nnn The SMF record number to use when writing the accounting records.								
	YES Create accounting data.  char=separator character(s). Up to seven separator characters can be specified using the SEPARATOR suboption, for example:  ACCOUNTING = (YES, SEPARATOR=;)  If no separator character is specified, the comma character will be used.								
	See also <i>Accounting in Entire2</i> documentation.	X Broker i	n the pla	tform-sp	ecific Adı	ministrat	tion		

	Ор	Operating System						
Attribute	Values	Opt/ Req	z/OS	UNIX	Windows	z/VSE	BS2000	
ACCOUNTING-VERSION	1   2   3   4   5	Ο	z	u	w	V	b	
	Determines whether accounting records are created.  1 Collect accounting information. This value is supported for reasons of compatibility with EntireX Broker 7.2.1 and below.							
	<ul><li>2 Collect extended accounting information in addition to that avail.</li><li>3 Create accounting records in layout of version 3.</li></ul>							
	4 Create accounting records	in layou	t of versi	on 4.				
	5 Create accounting records							
	This parameter applies wher	1	TING is a	ctivated			1	
ACI-CONVERSION	YES I NO	О	Z	u	W	V	b	
APPLICATION-MONITORING or APPMON	Determines the handling of ACI request and response strings of USTATUS.  YES Convert ACI request and response strings with ICU. See ICU Conversion in the Internationalization documentation.  NO Translate ACI request and response with internal translation table without support of national characters. See Translation User Exit in the Internationalization documentation.  Note: This attribute was undocumented in earlier EntireX versions and had default value NO. This meant that a translation user exit was used instead; this is no longer recommended.  YES I NO Description of EntireX Broker.  YES Enable application monitoring.  NO Disable application monitoring.  See Application Monitoring.							
AOTOLOGON	YES I NO  O  z  u  w  v  b  YES LOGON occurs automatically during the first SEND or REGISTER.  NO  The application has to issue a LOGON call.							
AUTOSTART	NO I YES	О		u	W			
This attribute defines the autostart behavior of a broker.  NO Broker is <i>not</i> started automatically with the next system start.  YES Broker is restarted automatically with the next system start.

	ETB.LOG file. See <i>Trace File I</i> documentation.	Handling i	in the UN	VIX and	Windows	Adminis	stration				
MAX-UOW-MESSAGE-LENGTH	See MAX-MESSAGE-LENGTH.										
MAX-UOWS	<u>0</u>   <i>n</i>	0	Z	u	w	V	b				
	The maximum number of UOWs that can be concurrently active broker-wide. The default value is 0 (zero), which means that the broker will process only messages that are not part of a unit of work. If UOW processing is to be done by any service, a MAX-UOWS value must be 1 or larger for the broker.										
	The MAX-UOWS value for the service will default to the value set for the broker.  NUM-UOW is an alias of this parameter.										
MESSAGE-CASE	NONE I UPPER I LOWER	0	Z	u	w	V	b				
		ndicates if certain error message texts returned by the broker to its clients or writt y the broker to its log file are to be in mixed case, uppercase, or lowercase.									
	NONE No changes are made	e to mess	age case.								
	UPPER Messages are change	ed to upp	ercase.								
	LOWER Messages are changed to lowercase.										
MUOW	See NUM-UOW.										
NEW-UOW-MESSAGES	YES I NO	О	Z	u	w	V	b				
	NO New UOW messages and This applies to UOW when used non-persistent UOWs. A usal The broker persistent store reset NEW-UOW-MESSAGES to Neafter a broker restart. This act UOWs to occur after broker is sufficiently reduced, the Entitisee ALLOW-NEWUOWMSGS. This	No New UOW messages are not allowed.  This applies to UOW when using Persistence and should not be used for con-persistent UOWs. A usage example could be the following:  The broker persistent store reaches capacity and the broker shuts down. You can et NEW-UOW-MESSAGES to NO to prevent new UOW messages from being added fter a broker restart. This action allows only consumption (not production) of JOWs to occur after broker restart. After the persistent store capacity has been ufficiently reduced, the EntireX Broker administrator can issue a CIS commandee ALLOW-NEWUOWMSGS. This action allows new UOW messages to be sent to the oroker. Reset attribute NEW-UOW-MESSAGES to YES, which permits new UOW									
NUM-BLACKLIST-ENTRIES	<u>256</u> l n	О	z	u	w	V	b				
	Number of entries in the participant blacklist. Default value is 256 entries. Tog with BLACKLIST-PENALTY-TIME and PARTICIPANT-BLACKLIST, this attrib used to protect a broker running with SECURITY=YES against denial-of-serv attacks. See <i>Protecting a Broker against Denial-of-Service Attacks</i> in the platform-sp broker Administration documentation.

# **Service-specific Attributes**

Each section begins with the keyword <code>DEFAULTS=SERVICE</code>. Services with common attribute values can be grouped together. The attributes defined in the grouping apply to all services specified within it. However, if a different attribute value is defined immediately following the service definition, that new value applies. See also the sections <code>Wildcard Service Definitions</code> and <code>Service Update Modes</code> below the table.

		Opt/	Operating System

		Opt/	Opt/ Operating System									
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000					
	nD Number of days (max. 24855).											
	The lifetime determines how much additional time the UOW status is retained in the persistent store and is calculated from the time at which the associated UOW enters any of the following statuses: PROCESSED, TIMEOUT, BACKEDOUT, CANCELLED, DISCARDED. The additional lifetime of the UOW status is calculated only when broker is executing. Value in UOW-STATUS-LIFETIME supersedes the value (if specified) in attribute UWSTATP.											
	<b>Note:</b> If no unit is specified, the default unit is seconds. The unit does not have											
	to be identical to the unit specified for UC	)W - D <i>A</i>	ATA-L	_I F E T	TIME.							
UWSTATP	<u>0</u>   <i>n</i>	О	Z	u	w	v	b					
	Contains a multiplier used to compute the service. The UWSTATP value is multiplied (the lifetime of the associated UOW) to describe will be retained in the persistent store.	by tl	ne U0	W-ST	ATUS-LI	FETIM	E value					
	0 The status is not persistent.											
	1 - 254 Multiplied by the value of UOW-DA a persistent status will be retaine		LIFE <sup>-</sup>	TIME	to determ	ine ho	w long					
	This attribute is ignored if PSTORE=N0 is	defir	ned.									
	<b>Note:</b> This attribute has not been supported since EntireX version 7.3. Use UOW-STATUS-LIFETIME instead.											
UWSTAT-LIFETIME	Alias for UOW-STATUS-LIFETIME.											
UWTIME	Alias for UOW-DATA-LIFETIME.											

## **Wildcard Service Definitions**

The special names of CLASS = \*, SERVER = \* and SERVICE = \* are allowed in the service-specific and authorization rule-specific sections of the broker attribute file. These are known as "wildcard" service definitions. If this name is present in the attribute file, any service that registers with the broker and does not have its own entry in the attribute file will inherit the attributes that apply to the first wildcard service definition found.

For example, a server that registers with CLASS=ACLASS, SERVER=ASERVER and SERVICE=ASERVICE can inherit attributes from any of the following entries in the attribute file (this list is not necessarily complete):

```
CLASS = *, SERVER = ASERVER, SERVICE = ASERVICE
CLASS = ACLASS, SERVER = *, SERVICE = *
CLASS = *, SERVER = *, SERVICE = *
```

Of course, if there is a set of attributes that are specifically defined for CLASS=ACLASS, SERVER=ASERV-ER, SERVICE=ASERVICE, then all of the wildcard service definitions will be ignored in favor of the exact matching definition.

## **Service Update Modes**

EntireX has two modes for handling service-specific attributes. See broker-specific attribute SER-VICE-UPDATES.

- In service update mode (SERVICE-UPDATES=YES), the service configuration sections of the attribute file are read whenever the first replica of a particular service registers.
- In **non-update mode** (SERVICE-UPDATES=NO), the attribute file is not reread. All attributes are read during startup and the broker does not honor any changes in the attribute file. This mode is useful if
  - there is a high frequency of REGISTER operations, or
  - the attribute file is rather large and results in a high I/O rate for the broker.

The disadvantage to using non-update mode is that if specific attributes are modified, the broker must be restarted to effect the changes. Generally, this mode should be used only if the I/O rate of the broker is considerably high, and if the environment seldom changes.

### **OPTION Values for Conversion**

The different option values allow you to either handle character conversion deficiencies as errors, or to ignore them:

- 1. Do not ignore any character conversion errors and force an error always (value STOP). This is the default behavior.
- 2. Ignore if characters cannot be converted into the receiver's codepage, but force an error if sender characters do not match the sender's codepage (value SUBSTITUTE-NONCONV).
- 3. Ignore any character conversion errors (values SUBSTITUTE and BLANKOUT).

Situations 1 and 2 above are reported to the broker log file if the TRACE option for CONVERSION is set to level 1.

				Report Situation in Broker Log File		
				if TRACE	Option for	
		Options Su	pported for	CONVERSIO	ON is set to 1	
Value	Description	SAGTCHA	SAGTRPC	Bad Input Characters (Sender's Codepage)	Non-convertible Characters (Receiver's Codepage)	
SUBSTITUTE	Substitutes both non-convertible characters (receiver's codepage) and bad input characters (sender's codepage) with a codepage-dependent default replacement character.	YES	YES	No message.	No message	
SUBSTITUTE-NONCONV	If a corresponding code point is not available in the receiver's codepage, the character cannot be converted and is substituted with a codepage-dependent default replacement character. Bad input characters in sender's codepage are not substituted and result in an error.	YES	YES	Write detailed conversion error message.	No message.	
BLANKOUT	Substitutes non-convertible characters with a codepage-dependent default replacement; blanks out the complete RPC IDL field containing one or more bad input characters.	NO	YES	No message.	No message.	
STOP	Signals an error on detecting a non-convertible or bad input character. This is the default behavior if no option is specified.	YES	YES	conversion	Write detailed conversion error message.	

# **Codepage-specific Attributes**

The codepage-specific attribute section begins with the keyword <code>DEFAULTS=CODEPAGE</code> as shown in the sample attribute file. You can use the attributes in this section to customize the broker's locale string defaults and customize the mapping of locale strings to codepages for character conversion with ICU conversion and SAGTRPC user exit. See <code>Internationalization with EntireX</code> for more information.

		Opt/	Operating System							
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000

	For more examples, see <i>Additional Notes</i> below	υ,	Broker's I	Built-in Lo	ocale String	Mapping	and also		

### **Additional Notes**

- Locale string matching is case insensitive when bypassing the broker's built-in mechanism, that is, when the broker examines the codepages section in the attribute file.
- If ICU is used for character conversion and the style in not known by ICU, e.g. <ll>\_<cc> etc., the name will be mapped to a suitable ICU alias. For more details on the mapping mechanism, see *Broker's Built-in Locale String Mapping*. For more details on ICU and ICU converter name standards, see *ICU Resources*.
- If SAGTRPC user exit is used for the character conversion, we recommend assigning the codepage in the form CP<nnnnn>. To determine the number given to SAGTRPC user exit, see *Broker's Built-in Locale String Mapping*.
- See CONVERSION on this page for the character conversion in use.

# **Adabas SVC/Entire Net-Work-specific Attributes**

The Adabas SVC/Entire Net-Work-specific attribute section begins with the keyword <code>DEFAULTS=NET</code> as shown in the sample attribute file. The attributes in this section are needed to execute the Adabas SVC/Entire Net-Work communicator of the EntireX Broker kernel.

**Note**: This section applies to mainframe platforms only. It does not apply to UNIX and Windows.

		Opt/		Ор	erating Syst	tem				
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000			
ADASVC	nnn	R	z			v				
	Sets the Adabas SVC number for EntireX Broker access.  The Adabas SVC is used to perform various internal functions, including communication between the caller program and EntireX Broker.

## **SSL/TLS-specific Attributes**

The Broker can use Secure Sockets Layer/Transport Layer Security (SSL/TLS) as the transport medium. The term "SSL" in this section refers to both SSL and TLS. RPC-based clients and servers, as well as ACI clients and servers, are always SSL clients. The broker is always the SSL server. For an introduction see *SSL/TLS* and *Certificates with EntireX*.

Your operating system and, for z/OS, the approach you use determine whether this section of the attribute file is required:

#### ■ z/OS

#### AT-TLS

This is the approach we recommend. IBM's Application Transparent Transport Layer Security (AT-TLS) does not require the SSL-specific attribute section.

#### ■ Direct SSL

For direct SSL/TLS support, the SSL-specific attribute section is required. It begins with the keyword <code>DEFAULTS=SSL</code> as shown in the sample attribute file.

**Note:** Direct SSL/TLS support (using GSK) inside the Broker under z/OS will be dropped in the next version. We strongly recommend using IBM's Application Transparent Transport Layer Security (AT-TLS) instead.

See Running Broker with SSL/TLS Transport in the z/OS Administration documentation.

## ■ UNIX and Windows

The SSL-specific attribute section is required, and begins with the keyword DEFAULTS=SSL as shown in the sample attribute file.

The attributes in this section are needed to execute the SSL communicator of the EntireX Broker kernel.

See Running Broker with SSL/TLS Transport.

### ■ z/VSE

The SSL-specific attribute section is not used. You can use BSI's Automatic Transport Layer Security (ATLS). See *Running Broker with SSL/TLS Transport* in the z/VSE Administration documentation.

# **DIV-specific Attributes**

These attributes define a persistent store that is implemented as a VSAM linear data set (LDS) accessed using Data In Virtual (DIV). This DIV persistent store is a container for units of work. The DIV-specific attribute section begins with the keyword <code>DEFAULTS = DIV</code>. The attributes in this section are required if <code>PSTORE-TYPE = DIV</code> is specified.

**Note**: All attributes except the deprecated DIV were introduced with EntireX version 9.12. They replace the *Format Parameters* of earlier versions, which are deprecated but still supported for compatibility reasons.

		Opt/	Operating System								
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000

# **Adabas-specific Attributes**

The Adabas-specific attribute section begins with the keyword <code>DEFAULTS = ADABAS</code>. The attributes in this section are required if <code>PSTORE-TYPE = ADABAS</code> is specified. In previous versions of EntireX, these Adabas-specific attributes and values were specified in the broker-specific <code>PSTORE-TYPE</code> attribute.

		Opt/	Operating System								
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000				
BLKSIZE	126-20000	0	z	u	w	v	b				
	Optional blocking factor used for message data. If not specified, broker will split the message data into 2 KB blocks to be stored in Adabas records. The maximum value depends on the physical device assigned to data storage. See the <i>Adabas</i> documentation.  For reasons of efficiency, do not specify a BLKSIZE much larger than the actual total size of the UOW data to be written. The total UOW size is the sum of all messages in the UOW plus 41 bytes of header information. This takes effect only after COLD start.  The BLKSIZE parameter applies only for a cold start of broker; subsequently the value of BLKSIZE is taken from the last cold start.  Default value is 2000.										
DBID	1-32535	R	z	u	w	v	b				
	Database ID of Adabas	l database w	here the pe	rsistent sto	re resides.		<u> </u>

	0 No tracing. Default v	alue.										
	1 Log selected Adabas	CB fields (co	ommand co	de, respons	se code, sub	code, ISN, a	additions).					
	2 n/a											
	3 All of trace level 1, plus UOWID in use for the various Adabas requests and function entered/exit mesages.											
	4 All of trace level 3, plus more Adabas CB fields for successful requests and returned function values.											
	Trace levels 2, 3 and 4 sh	nould be us	ed only wh	ien request	ed by Softw	are AG sup	port.					
	If you modify the TRACE-LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE-LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.											

# **Application Monitoring-specific Attributes**

The application monitoring-specific attribute section begins with the keyword DEFAULTS=APPLICATION-MONITORING. It contains attributes that apply to the application monitoring functionality. At startup time, the attributes are read if the Broker-specific attribute APPLICATION-MONITORING=YES is specified. Duplicate or missing values are treated as errors. When an error occurs, application monitoring is turned off and EntireX Broker continues execution. See *Application Monitoring*.

		Opt/		Ор	erating Sys	stem				
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000			
APPLICATION-MONITORING-NAME or	A100	0	z	u	W	v	b			
APPMON-NAME	Specifies a default application monitoring name. Used to set the value of the <b>ApplicationName</b> KPI.									
COLLECTOR-BROKER-ID	A64	R	z	u	w	v	b			
	Identifies the Application Monitoring Data Collector. Has the forma host_name:port_number, where host_name is the host where the Application Monitoring Data Collector is running and port_number is the port number of the Application Monitoring Data Collector. The default port is 57900.									
TRACE-LEVEL	<u>0</u> - 4	О	z	u	w	v	b

	4 All of trace level 3, plus returned function values.									
	Trace levels 2, 3 and 4 should be used only when requested by Software AG support.									
	If you modify the TRACE broker for the change to t dynamically for applica	take eff	ect. TR	ACE-LI						

# **Authorization Rule-specific Attributes**

The authorization rule-specific attribute section begins with the keyword DEFAULTS=AUTHORIZATION-RULES. It contains attributes that enhance security-related definitions. At startup time, the attributes are read if the following conditions are met:

- Broker-specific attribute SECURITY=YES
- Security-specific attributes SECURITY-SYSTEM=OS and SECURITY-LEVEL=AUTHORIZATION

When an error occurs, the EntireX Broker stops. See *Authorization Rules*.

		Opt/		Ор	erating Syst	em					
Attribute	Values	Req	z/OS	UNIX	Windows	z/VSE	BS2000				
RULE - NAME	A32	R		u	W						
	Specifies a rule name. A rule is a container for a list of services and a list of client and server user IDs. All users defined in a rule are authorized to use all services defined in his rule. See example under <i>Rules Stored in Broker Attribute File</i> .  R u w										
CLASS	A32	R		u	W						
SERVICE	These three attributes together identify the service. CLASS must be specified first, followed immediately by SERVER and SERVICE. <i>Wildcard Service Definitions</i> are allowed.										
CLIENT-USER-ID	A32	R		u	w						
	Defines an authorized client user ID.										
SERVER-USER-ID	A32	R		u	w						
	Defines an authorized se	erver user	ID.								

## Variable Definition File

The broker attribute file contains the configuration of one EntireX Broker instance. In order to share attribute files between different brokers, you identify the attributes that are unique and move them to a variable definition file. This file enables you to share one attribute file among different brokers. Each broker in such a scenario requires its own variable definition file.

The following attributes are considered unique for each machine:

- BROKER-ID (in Broker-specific Attributes)
- NODE (in *Adabas SVC/Entire Net-Work-specific Attributes*)
- PORT (in SSL/TLS-specific Attributes and TCP/IP-specific Attributes)

How you use the variable definition file will depend upon your particular needs. For instance, some optional attributes may require uniqueness - for example, DBID and FNR in DEFAULTS=ADABAS - so that you may specify the persistent store.

# 4 Broker Resource Allocation

General Considerations	80
Specifying Global Resources	80
Restricting the Resources of Particular Services	81
Specifying Attributes for Privileged Services	83
Maximum Units of Work	83
Calculating Resources Automatically	84
Dynamic Memory Management	86
Storage Report	88
Maximum TCP/IP Connections per Communicator	89

The EntireX Broker is a multithreaded application and communicates among multiple tasks in memory pools.

## **General Considerations**

Resource considerations apply to both the global and service-specific levels:

- Dynamic assignment of global resources to services that need them prevents the return of a "Resource Shortage" code to an application when resources are available globally. It also enables the EntireX Broker to run with fewer total resources, although it does not guarantee the availability of a specific set of resources for a particular service.
- Flow control ensures that individual services do not influence the behavior of other services by accident, error, or simply overload. This means that you can restrict the resource consumption of particular services in order to shield the other services.

In order to satisfy both global and service-specific requirements, the EntireX Broker allows you to allocate resources for each individual service or define global resources which are then allocated dynamically to any service that needs them.

The resources in question are the number of conversations, number of servers, plus units of work and the message storage, separated in a long buffer of 4096 bytes and short buffer of 256 bytes. These resources are typically the bottleneck in a system, especially when you consider that non-conversational communication is treated as the special case of "conversations with a single message only" within the EntireX Broker.

Global resources are defined by the parameters in the Broker section of the attribute file. The number of conversations allocated to each service is defined in the service-specific section of the attribute file. Because the conversations are shared by all servers that provide the service, a larger number of conversations should be allocated to services that are provided by more than one server. The number of conversations required is also affected by the number of clients accessing the service in parallel.

# **Specifying Global Resources**

You can specify a set of global resources with no restrictions on which service allocates the resources:

- Specify the global attributes with the desired values.
- Do not specify any additional restrictions. That is, do not provide values for the following Broker-specific attributes:

LONG-BUFFER-DEFAULT SHORT-BUFFER-DEFAULT

```
CONV-DEFAULT
SERVER-DEFAULT
```

Also, do not provide values for the following server-specific attributes:

```
LONG-BUFFER-LIMIT
SERVER-LIMIT
SHORT-BUFFER-LIMIT
CONV-LIMIT
```

### Example

The following example defines global resources. If no additional definitions are specified, resources are allocated and assigned to any server that needs them.

```
NUM-CONVERSATION=1000
NUM-LONG-BUFFER=200
NUM-SHORT-BUFFER=2000
NUM-SERVER=100
```

# **Restricting the Resources of Particular Services**

You can restrict resource allocation for particular services in advance:

- Use CONV-LIMIT to limit the resource consumption for a specific service.
- Use CONV-DEFAULT to provide a default limit for services for which CONV-LIMIT is not defined.

#### Example

In the following example, attributes are used to restrict resource allocation:

```
DEFAULTS=BROKER
NUM-CONVERSATION=1000
CONV-DEFAULT=200

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, CONV-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, CONV-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

- Memory for a total of 1000 conversations is allocated (NUM-CONVERSATION=1000).
- Service A (CLASS A, SERVER A, SERVICE A) is limited to 100 conversation control blocks used simultaneously (CONV-LIMIT=100). The application that wants to start more conversations than specified by the limit policy will receive a "Resource shortage" return code. This return code should result in a retry of the desired operation a little later, when the resource situation may have changed.

- Service B (CLASS B, SERVER B, SERVICE B) is allowed to try to allocate as many resources as necessary, provided the resources are available and not occupied by other services. The number of conversations that may be used by this service is unlimited (CONV-LIMIT=UNLIM).
- Service C (CLASS C,SERVER C,SERVICE C) has no explicit value for the CONV-LIMIT attribute. The number of conversation control blocks that it is allowed to use is therefore limited to the default value which is defined by the CONV-DEFAULT Broker attribute.

The same scheme applies to the allocation of message buffers and servers:

■ In the following example, long message buffers are allocated using the keywords NUM-LONG-BUFFER, LONG-BUFFER-DEFAULT and LONG-BUFFER-LIMIT:

```
DEFAULTS=BROKER
NUM-LONG-BUFFER=2000
LONG-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, LONG-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, LONG-BUFFER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

■ In the following example, short message buffers are allocated using the keywords NUM-SHORT-BUFFER, SHORT-BUFFER-DEFAULT and SHORT-BUFFER-LIMIT:

```
DEFAULTS=BROKER
NUM-SHORT-BUFFER=2000
SHORT-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SHORT-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, SHORT-BUFFER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

In the following example, servers are allocated using the keywords NUM-SERVER, SERVER-DEFAULT and SERVER-LIMIT:

```
DEFAULTS=BROKER
NUM-SERVER=2000
SERVER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SERVER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, SERVER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

# **Specifying Attributes for Privileged Services**

If privileged services (services with access to unlimited resources) exist, specify UNLIMITED for the attributes CONV-LIMIT, SERVER-LIMIT, LONG-BUFFER-LIMIT and SHORT-BUFFER-LIMIT in the service-specific section of the attribute file.

### For example:

```
DEFAULTS=SERVICE
CONV-LIMIT=UNLIM
LONG-BUFFER-LIMIT=UNLIM
SHORT-BUFFER-LIMIT=UNLIM
SERVER-LIMIT=UNLIM
```

To ensure a resource reservoir for peak load of privileged services, define more resources than would normally be expected by specifying larger numbers for the Broker attributes that control global resources:

NUM-SERVER
NUM-CONVERSATION
CONV-DEFAULT
LONG-BUFFER-DEFAULT
SHORT-BUFFER-DEFAULT
SERVER-DEFAULT

## **Maximum Units of Work**

The maximum number of units of work (UOWs) that can be active concurrently is specified in the Broker attribute file. The MAX-UOWS attribute can be specified for the Broker globally as well as for individual services. It cannot be calculated automatically. If a service is intended to process UOWs, a MAX-UOWS value must be specified.

If message processing only is to be done, specify MAX-UOWS=0 (zero). The Broker (or the service) will not accept units of work, i.e., it will process only messages that are not part of a UOW. Zero is used as the default value for MAX-UOWS in order to prevent the sending of UOWs to services that are not intended to process them.

# **Calculating Resources Automatically**

To ensure that each service runs without impacting other services, allow the EntireX Broker to calculate resource requirements automatically:

- Ensure that the attributes that define the default total for the Broker and the limit for each service are not set to UNLIM.
- Specify AUTO for the Broker attribute that defines the total number of the resource.
- Specify a suitable value for the Broker attribute that defines the default number of the resource.

The total number required will be calculated from the number defined for each service. The resources that can be calculated this way are Number of Conversations, Number of Servers, Long Message Buffers and Short Message Buffers.

Avoid altering the service-specific definitions at runtime. Doing so could corrupt the conversation consistency. Applications might receive a message such as "NUM-CONVERSATIONS reached" although the addressed service does not serve as many conversations as defined. The same applies to the attributes that define the long and short buffer resources.

Automatic resource calculation has the additional advantage of limiting the amount of memory used to run the EntireX Broker. Over time, you should be able to determine which services need more resources by noting the occurrence of the return code "resource shortage, please retry". You can then increase the resources for these services. To avoid disruption to the user, you could instead allocate a relatively large set of resources initially and then decrease the values using information gained from the Administration Monitor application.

#### **Number of Conversations**

To calculate the total number of conversations automatically, ensure that the CONV-DEFAULT Broker attribute and the CONV-LIMIT service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify NUM-CONVERSATION=AUTO and an appropriate value for the CONV-DEFAULT Broker attribute. The total number of conversations will be calculated using the value specified for each service.

#### For example:

```
DEFAULTS=BROKER
NUM-CONVERSATION=AUTO
CONV-DEFAULT=200

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A
CLASS=B, SERVER=B, SERVICE=B, CONV-LIMIT=100
CLASS=C, SERVER=C, SERVICE=C
```

- Service A and Service C both need 200 conversations (the default value). Service B needs 100 conversations (CONV-LIMIT=100).
- Because NUM-CONVERSATIONS is defined as AUTO, the broker calculates a total of 500 conversations (200 + 200 + 100).
- NUM-CONVERSATIONS=AUTO allows the number of conversations to be flexible without requiring additional specifications. It also ensures that the broker is started with enough resources to meet all the demands of the individual services.
- AUTO and UNLIM are mutually exclusive. If CONV-DEFAULT or a single CONV-LIMIT is defined as UNLIM, the EntireX Broker cannot determine the number of conversations to use in the calculation, and the EntireX Broker cannot be started.

#### **Number of Servers**

To calculate the number of servers automatically, ensure that the SERVER-DEFAULT Broker attribute and the SERVER-LIMIT service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify NUM-SERVER=AUTO and an appropriate value for the SERVER-DEFAULT Broker attribute. The total number of server buffers will be calculated using the value specified for each service.

## For example:

```
DEFAULTS=BROKER
NUM-SERVER=AUTO
SERVER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SERVER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B
CLASS=C, SERVER=C, SERVICE=C
```

#### **Long Message Buffers**

To calculate the number of long message buffers automatically, ensure that the LONG-BUFFER-DE-FAULT Broker attribute and the LONG-BUFFER-LIMIT service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify NUM-LONG-BUFFER=AUTO and an appropriate value for the LONG-BUFFER-DEFAULT Broker attribute. The total number of long message buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-LONG-BUFFER=AUTO
LONG-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, LONG-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B
CLASS=C, SERVER=C, SERVICE=C
```

### **Short Message Buffers**

To calculate the number of short message buffers automatically, ensure that the <code>SHORT-BUFFER-DEFAULT</code> Broker attribute and the <code>SHORT-BUFFER-LIMIT</code> service-specific attribute are not set to <code>UNLIM</code> anywhere in the attribute file. Specify <code>NUM-SHORT-BUFFER=AUTO</code> and an appropriate value for the <code>SHORT-BUFFER-DEFAULT</code> Broker attribute. The total number of short message buffers will be calculated using the value specified for each service.

## For example:

```
DEFAULTS=BROKER
NUM-SHORT-BUFFER=AUTO
SHORT-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A
CLASS=B, SERVER=B, SERVICE=B, SHORT-BUFFER-LIMIT=100
CLASS=C, SERVER=C, SERVICE=C
```

# **Dynamic Memory Management**

Dynamic memory management is a feature to handle changing Broker workload without any restart of the Broker task. It increases the availability of the Broker by using various memory pools for various Broker resources and by being able to use a variable number of pools for the resources.

If more memory is needed than currently available, another memory pool is allocated for the specific type of resource. If a particular memory pool is no longer used, it will be deallocated.

The following Broker attributes can be omitted if DYNAMIC-MEMORY-MANAGEMENT=YES has been defined:

```
■ NUM-CLIENT ■ NUM-LONG[-BUFFER] ■ NUM-SHORT[-BUFFER]
■ NUM-CMDLOG-FILTER ■ NUM-SERVER ■ NUM-UOW|MAX-UOWS|MUOW
■ NUM-COMBUF ■ NUM-SERVICE ■ NUM-WQE
■ NUM-CONV[ERSATION] ■ NUM-SERVICE-EXTENSION
```

If you want statistics on allocation and deallocation operations in Broker, you can configure Broker to create a storage report with the attribute STORAGE-REPORT. See *Storage Report* below.

**Note:** To ensure a stable environment, some pools of Broker are not deallocated automatically. The first pools of type COMMUNICATION, CONVERSATION, CONNECTION, HEAP, PARTICIPANT, PARTICIPANT EXTENSION, SERVICE ATTRIBUTES, SERVICE, SERVICE EXTENSION, TIMEOUT QUEUE, TRANSLATION, WORK QUEUE are excluded from the automatic deallocation even when they have not been used for quite some time. Large pools cannot be reallocated under some circumstances if the level of fragmentation in the address space has been increased in the meantime.

## **Storage Report**

You can create an optional report file that provides details about all activities to allocate or to deallocate memory pools. This section details how to create the report and provides a sample report.

- Creating a Storage Report
- Platform-specific Rules
- Sample Storage Report

See also Broker-specific attribute STORAGE-REPORT.

## **Creating a Storage Report**

Use Broker's global attribute STORAGE-REPORT with the value YES. If attribute value YES is supplied, all memory pool operations will be reported if the output mechanism is available. If the value NO is specified, no report will be created.

## Platform-specific Rules

Logical unit SYS015 and logical file name *ETBSREP* are used. Format RECORD-FORMAT=FB, RECORD-LENGTH=121 is used.

## Sample Storage Report

The following is an excerpt from a sample STORAGE report.

```
EntireX 8.1.0.00 STORAGE Report 2009-06-26 12:28:58 Page 1

Identifier Address Size Total Date Time Action KERNEL POOL 0x25E48010 407184 bytes 407184 bytes 2009-06-26 12:... Allocated HEAP POOL 0x25EB4010 1050692 bytes 1457876 bytes 2009-06-26 12:... Allocated ...
```

Header	Description
Identifier	Name of the memory pool.
Address	Start address of the memory pool.
Size	Size of the memory pool.
Total	Total size of all obtained memory pools.
Date, Time	Date and time of the action.
Action	The action of Broker. The following actions are currently supported: Allocated: memory pool is allocated.  Deallocated: memory pool is deallocated.

# **Maximum TCP/IP Connections per Communicator**

This table shows the generated maximum number of TCP/IP connections per communicator. See also:

Platform	Maximum Number of TCP/IP Connections per Communicator
AIX	2,048
BS2000	2,048
Linux	65,534
Solaris	65,356
Windows	4,096
z/OS	16,384
z/VSE	2,048

With the Broker-specific attribute POLL, these restrictions can be lifted under z/OS, UNIX and z/VSE. See POLL.

The number of communicators multiplied by the maximum number of connections cannot exceed the maximum number of file descriptors per process.

See also MAX-CONNECTIONS under TCP-OBJECT (Struct INFO\_TCP) under *Broker CIS Data Structures* in the EntireX Broker ACI Programming documentation.

# 5 Administering Broker Stubs

Available Stubs	9	<del>)</del> 2
<ul> <li>Transport Methods for Broker Stubs</li> </ul>	9	<del>)</del> 2
<ul> <li>Using the Batch Stub Interface Module BK</li> </ul>	IMB9	<b>)</b> 4
•	MC9	
3	9	

## **Available Stubs**

This table lists all Broker stubs available under the z/VSE operating system that are to be used with the programming languages Natural, COBOL, Assembler and C.

The stub you choose depends on the following:

- the environment (CICS or Batch)
- the availability of administration features such as tracing and compression

	Transport				
Environment	NET	TCP	SSL	Trace	Stub Module
All environments that use Batch	Yes	Yes	(1)	Yes (2)	BKIMB
All environments that use CICS	Yes	Yes	(1)	Yes (2)	BKIMC

#### Notes:

- 1. Use BSI's Automatic Transport Layer Security (ATLS). Refer to the BSI SSL Installation, Programming and User's Guide for more information. See also Using SSL/TLS with EntireX Components.
- 2. The request needs to use TCP transport method. Tracing is not available with NET transport.

# **Transport Methods for Broker Stubs**

- Transport Method Values
- Setting the Timeout for the Transport Method
- Limiting the TCP/IP Connection Lifetime

## **Transport Method Values**

Transport Value	Tips
TCP	■ Provides remote machine and cross-platform communication.
NET	Provides the best performing transport if the application and Broker kernel reside on the same machine.
	Provides for remote communications if Entire Net-Work is also installed on the application and Broker kernel machines.
	Requires the installation of Adabas components. We recommend installing the Adabas modules delivered with EntireX installation kit. See your Adabas documentation for more information on installing the Adabas SVC.

Transport Va	ue Tips
	■ Tracing is not supported.

For Secure Sockets Layer/Transport Layer Security (SSL/TLS) as transport method, see table *Using SSL/TLS with EntireX Components*.

To use the stubs' internal security functionality, API version 8 or higher needs to be used by the application. (e.g., EntireX RPC Server, NAT42). The delivered phases are linked for use with internal security.

## **Setting the Timeout for the Transport Method**

#### Introduction

If the transport layer is interrupted, communication between the broker and the stub - that is, client or server application - is no longer possible. A client or server might possibly wait infinitely for a broker reply or message in such a situation. To prevent this and return control to your calling application in such a situation, set a timeout value for the transport method.

The timeout settings for transport layers are independent of the timeout settings of the broker.

Setting the timeout for the transport layer is possible for the transport method TCP, and is supported by all broker stubs under z/VSE.

#### **Transport Timeout Values**

The timeout value for the transport method is set by the environment variable TIMEOUT on the stub side. This transport timeout is used together with the broker timeout - which is set by the application in the WAIT field of the broker ACI control block - to calculate the actual value for the transport layer's timeout. The following table describes the possible values for the transport timeout:

Transport Timeout Value	Description
0	Infinite wait for the application.
n	The transport method additionally waits this time in seconds. A negative value is treated as TIMEOUT=0 (infinite wait for the application).
nothing set	Transport method waits additional 20 seconds.

The actual timeout for transport layer equals broker timeout (WAIT field) + timeout value for transport method.

## Limiting the TCP/IP Connection Lifetime

With transport method TCP/IP, the broker stub establishes one or more TCP/IP connections to the brokers specified with BROKER-ID. These connections can be controlled by the transport-specific CONNECTION-NONACT attribute on the broker side, but also by the transport-specific environment variable NONACT on the stub side. If NONACT is not 0, it defines the non-activity time (in seconds) of active TCP/IP connections to any broker. See NONACT under *Environment Variables in EntireX*. Whenever the broker stub is called, it checks for the elapsed non-activity time and closes connections with a non-activity time greater than the value defined with NONACT. Stubs capable of running in SRB mode do not support NONACT handling.

Transport Non-activity Value	Description
0	Infinite lifetime until application is stopped.
n (seconds)	Transport connections with non-activity time greater than $n$ will be closed.
Nothing set	Infinite lifetime until application is stopped.

# **Using the Batch Stub Interface Module BKIMB**

You can use BKIMB for all batch environments. This stub interface module is delivered as a phase, which can be loaded by your application dynamically, and as an object for linking. During runtime, the EXX960 library and the WAL826 library need to be included into the LIBDEF search chain. If you need to statically link your application with the interface object, include the following objects:

```
PHASE <appl_phase_name>,*
INCLUDE <app_obj>
INCLUDE BKIMB
INCLUDE ETBVPRE
INCLUDE ETBVEVA
INCLUDE ETBENC
INCLUDE ETBTB
ENTRY <app_entry>
```

#### > To set up a secure environment

1 Statically link your application with the following interface objects:

```
PHASE <appl_phase_name>,*

INCLUDE <app_obj>
INCLUDE BKIMB
INCLUDE ETBUPRE
INCLUDE ETBUPRE
INCLUDE ETBVPRE
INCLUDE ETBVPRE
INCLUDE ETBVPRE
INCLUDE ETBVEVA
INCLUDE ETBVEVA
INCLUDE ETBENC
INCLUDE ETBTB
ENTRY <app_entry>
```

#### Or:

If BKIMB is to be loaded dynamically, you can relink the phase for use with security. Refer to the delivered job control example BKIMB.J.

2 Rename phase SECUEXI0 in library EXX960 to SECUEXIT.

# Using the CICS Stub Interface Module BKIMC

You can use BKIMC for all CICS environments. This stub interface module is delivered as a phase, which can be loaded by your application dynamically, and as an object for linking. To enable CICS to find the various programs, include the EXX960 sublibrary in the DFHRPL chain and add following definition to your CICS environment:

```
DEFINE PROGRAM(BKIMC) GROUP(EXX) LANGUAGE(ASSEMBLER) (only required if not linked ↔ to your application)
DEFINE PROGRAM(BROKERC) GROUP(EXX) LANGUAGE(C)
```

If you need to statically link your application with the interface object, include the following objects:

```
PHASE <appl_phase_name>,*

INCLUDE <app_obj>
INCLUDE BKIMC
INCLUDE ETBVPRE
INCLUDE ETBVEVA
INCLUDE ETBENC
INCLUDE ETBTB
ENTRY <app_entry>
```

## > To set up a secure environment

1 Statically link your application with the following interface objects:

```
PHASE <app]_phase_name>,*

INCLUDE <app_obj>
INCLUDE BKIMC
INCLUDE ETBUPRE
INCLUDE ETBUPRE
INCLUDE ETBVPRE
INCLUDE ETBVPRE
INCLUDE ETBVPRE
INCLUDE ETBVEVA
INCLUDE ETBVEVA
INCLUDE ETBENC
INCLUDE ETBTB
ENTRY <app_entry>
```

#### Or:

If BKIMC is to be loaded dynamically, you can relink the phase for use with security. Refer to the delivered job control example BKIMC.J.

2 Rename phase SECUEXI0 in library EXX960 to SECUEXIT.

# **Tracing for Broker Stubs**

If transport method TCP is used, a stub trace may be turned on for diagnostic purposes. Set up the following environment variable in your application job control or CICS startup.

//SETPARM STUBLOG=2

96

# 6 Operator Commands

<ul><li>Com</li></ul>	mand Syntax	98
	eral Broker Commands	
	cipant-specific Commands	
	rrity-specific Commands	
	sport-specific Commands	
<ul><li>XCO</li></ul>	M-specific Commands	112

# **Command Syntax**

The following command format is required to communicate with EntireX Broker, using the operator console. Parameters in UPPERCASE must be typed "as is". Parameters in lowercase must be substituted with a valid value. Operator commands have the following format:

```
task_id command[parameter]
```

```
where task_id is the ID of the broker task
```

command is the operator command

parameter is an optional parameter allowed by the operator command you are issuing

## **General Broker Commands**

The following broker commands are available:

- BROKER TRACE
- DPOOL
- DRES
- DSTAT
- ETBEND
- ETBSTOP
- FLUSH
- PSTORE TRACE
- SHUTDOWN class, server, service
- TRACE
- TRAP-ERROR

## **BROKER TRACE**

Alias of broker command TRACE. Modifies the setting of the broker-specific attribute TRACE-LEVEL.

## Example

- > To set a trace level 2 for broker
- Enter command:

```
task_id BROKER TRACE=2
```

If the console prompt is suppressed, enter an MSG command before the console command:

```
MSG partition_id
```

See TRACE-LEVEL under Broker Attributes.

#### **DPOOL**

Lists all memory pools currently allocated by EntireX Broker. Start address, pool size in bytes and name of pool are provided. There can be multiple entries for a specific type of pool.

### Sample Output

```
ETBM0720 Operator typed in: DP00L
ETBM0657 Broker pool usage:
ETBM0657 0x2338FFB8 16781380 bytes COMMUNICATION POOL
ETBM0657 0x243A9EB8
                     368964 bytes CONVERSATION POOL
                      233668 bytes CONNECTION POOL
ETBM0657 0x24404F38
ETBM0657 0x2443EF38
                      4395204 bytes LONG MESSAGES POOL
                      3703876 bytes SHORT MESSAGES POOL
ETBM0657 0x24870BB8
ETBM0657 0x24BF9398
                      134244 bytes PARTICIPANT POOL
ETBM0657 0x24C1AF78
                        36996 bytes PARTICIPANT EXTENSION POOL
                       26724 bytes PROXY QUEUE POOL
ETBM0657 0x24C24798
ETBM0657 0x24C2BDA8
                       131668 bytes SERVICE ATTRIBUTES POOL
ETBM0657 0x24C4CB98
                       54372 bytes SERVICE POOL
ETBM0657 0x24C5AF78
                        32900 bytes SERVICE EXTENSION POOL
ETBM0657 0x24C63B18
                        87268 bytes TIMEOUT QUEUE POOL
ETBM0657 0x24C79398
                       179300 bytes TRANSLATION POOL
ETBM0657 0x24CA5F38
                       176324 bytes UNIT OF WORK POOL
ETBM0657 0x24CD1798
                       391268 bytes WORK QUEUE POOL
ETBM0582 Function completed
```

#### DRES

Displays EntireX Broker's resource usage for conversations, message buffers, participants, services, the timeout queue, units of work, and the work queue. Resource usage provides the total number, the number of free elements, and the number of used elements.

## Sample Output

ETBM0720 Operator typed in: DRES				
ETBM0581 Broker resource usage:				
ETBM0581 Resource	Total #	- Free #	- Used ∦	
ETBM0581 Conversations	4096	852	3244	
ETBM0581 Long message buffers	0	0	0	
ETBM0581 Short message buffers	8192	7384	808	
ETBM0581 Participants	256	235	21	
ETBM0581 Services	256	240	16	
ETBM0581 Timeout Queue	1280	845	435	
ETBM0581 Units Of Work	0	0	0	
ETBM0581 Work Queue	256	239	17	
ETBM0582 Function completed				

## **DSTAT**

Displays the total number of active elements, and an optional high watermark for services, clients, servers, conversations and message buffers.

## Sample Output

```
ETBM0720 Operator typed in: DSTAT
ETBM0580 Broker statistics:
ETBM0580 NUM-SERVICE ..... 0
ETBM0580 Services active ...... 7
ETBM0580 NUM-CLIENT ..... 0
ETBM0580 Clients active ...... 10
ETBM0580 Clients active HWM ..... 10
ETBM0580 NUM-SERVER ..... 0
ETBM0580 Servers active ...... 10
ETBM0580 Servers active HWM ..... 10
ETBM0580 NUM-CONVERSATION ..... 0
ETBM0580 Conversations active ..... 607
ETBM0580 Conversations active HWM .. 968
ETBM0580 NUM-LONG-BUFFER ..... 0
ETBM0580 Long buffers active ..... 0
ETBM0580 Long buffers active HWM ... 0
ETBM0580 NUM-SHORT-BUFFER ..... 0
ETBM0580 Short buffers active ..... 1219
ETBM0580 Short buffers active HWM .. 1928
ETBM0582 Function completed
```

#### **ETBEND**

Processing stops immediately. Current calls to the EntireX Broker are not allowed to finish.

#### **ETBSTOP**

Alias of ETBEND.

#### **FLUSH**

Flush all trace data kept in internal trace buffers to stderr (SYSOUT). The broker-specific attribute TRMODE=WRAP is required.

## **PSTORE TRACE**

Modifies the trace level for the Adabas persistent store (Adabas-specific attribute TRACE-LEVEL).

## Example

- > To set a trace level 2 for the Adabas persistent store
- Enter command:

```
task_id PSTORE TRACE=2
```

See TRACE-LEVEL under Broker Attributes.

## SHUTDOWN class, server, service

Shuts down the specified service immediately and stops all servers that have registered this service.

## Example

- > To shutdown service CLASS=RPC, SERVER=SRV1, SERVICE=CALLNAT
- Enter command:

task\_id SHUTDOWN RPC, SRV1, CALLNAT

## **TRACE**

Modifies the setting of the broker-specific attribute TRACE-LEVEL.

## **Sample Commands**

- > To modify the trace level
- Enter command, for example:

```
task_id TRACE=0
task_id TRACE=1
task_id TRACE=4
```

See TRACE-LEVEL under Broker Attributes.

## TRAP-ERROR

Modifies the setting of the broker-specific attribute TRAP-ERROR.

## Sample Command

- > To modify the setting for TRAP-ERROR
- Enter command:

```
task_id TRAP-ERROR=nnnn
```

where *nnnn* is the four-digit API error number that triggers the trace handler.

See TRAP-ERROR under Broker Attributes.

# **Participant-specific Commands**

Within EntireX Broker nomenclature, a participant is an application implicitly or explicitly logged on to the Broker as a specific user. See *Implicit Logon* and *Explicit Logon*. A participant could act as client or server. The following participant-specific commands are available:

- CANCEL parameter
- USERLIST
- USERS parameter

## **CANCEL** parameter

Operator command CANCEL is used to delete participants from EntireX Broker. The following parameters are supported:

Parameter	Description
	Cancel all participants with the specified $user_id$ . Non-persistent resources will be freed by the timeout manager. Prefix "USER=" is the default value and may be omitted.
,	Cancel the participant with the sequence number <code>seqno</code> . Non-persistent resources will be freed by the timeout manager. Operator commands <code>USERLIST</code> and <code>USERS</code> display sequence numbers of all selected participants.

## **Sample Commands**

- > To cancel all participant entries of user "DOE"
- Enter command:

task\_id CANCEL DOE

Or:

task\_id CANCEL USER=DOE

- > To cancel participant with sequence number "11"
- Enter command:

```
task_id CANCEL SEQNO=11
```

#### **USERLIST**

Operator command USERLIST displays a list of selected participant entries. The following parameters are supported:

Parameter	Description
none   *	Display all participants.
user_id	Display all participants with user ID $user_id$ . Wildcard characters are supported.

## **Sample Commands**

## > To display all participants

■ Enter command:

```
task_id USERLIST

Or:

task_id USERLIST *
```

## > To display all participants with user ID "DOE"

■ Enter command:

```
task_id USERLIST DOE
```

This produces the following output. See *Description of USERLIST Output Columns* below.

- > To display all participants with user ID starting with uppercase "D"
- Enter command:

```
task_id USERLIST D*
```

This produces the following output. See *Description of USERLIST Output Columns* below.

# To display all participants with 4-character user ID, starting with uppercase "D" and with uppercase "E" as third character

■ Enter command:

```
task_id USERLIST D?E?
```

This produces the following output. See *Description of USERLIST Output Columns* below.

#### **Description of USERLIST Output Columns**

Keyword	Description
USER-ID	User ID (32 bytes, case-sensitive). See USER-ID under Broker ACI Fields.
С	Client.
	Y Participant is a client, otherwise "N".
S	Server.
	Y Participant is a server, otherwise "N".
E	Big endian.
	Y Participant is on a big-endian machine.  N Participant is on a little-endian machine.

Keyword	Description
CHR	Character set.
	ASC Participant is an ASCII user. EBC Participant is an EBCDIC user.
SEQNO	Sequence number of participant. Can be used for operator command CANCEL parameter.

# **USERS** parameter

Operator command USERS displays selected user data of participant entries. The following parameters are supported:

Parameter	Description
none   *	Display all participants.
user_id	Display all participants with user ID $user_id$ . Wildcard characters are supported.

# **Sample Commands**

# > To display all participants

■ Enter command:

task\_id USERS

Or:

> To display all participants with user ID "DOE"

■ Enter command:

task\_id USERS DOE

task\_id USERS \*

This produces the following output. See *Description of USERS Output Columns* below.

106

```
ETBM0720 Operator typed in: USERS DOE
ETBM0687 Participants:
ETBM0687 USER-ID: DOE
ETBM0687 CLIENT: N SERVER:
ETBM0687 SEQNO: 6 BIG ENDIAN: Y CHARSET: ASCII PUID:
ETBM0687 202073756E6578322D2D30303030324646462D2D3030303030303031
ETBM0687 TOKEN:
ETBM0582 Function completed
```

# **Description of USERS Output Columns**

Keyword	Description
USER-ID	User ID (32 bytes, case-sensitive). See USER-ID under Broker ACI Fields.
CLIENT	
	Y Participant is a client, otherwise "N".
SERVER	
	Y Participant is a server, otherwise "N".
BIG ENDIAN	
	Y Participant is on a big-endian machine.
	N Participant is on a little-endian machine.
CHARSET	
	ASC Participant is an ASCII user.
	EBC Participant is an EBCDIC user.
PUID	Internal unique ID of participant. Hexadecimal 28-byte value in printable format.
TOKEN	Optionally identifies the participant. See TOKEN under Broker ACI Fields.

# **Security-specific Commands**

#### **DSECSTAT**

Displays the number of successful and failed Security authentications and Security authorizations.

#### Sample Output

```
ETBM0720 Operator typed in: DSECSTAT
ETBM0579 Security Authentications - successful: 20 failed: 0
ETBM0579 Security Authorizations - successful: 0 failed: 0
```

#### **RESET userid**

Resets the Security context for the specified user ID.

#### Sample Output

```
ETBM0720 Operator typed in: RESET EXXBATCH
ETBM0578 Reset ACEE for SAF-ID EXXBATCH : 20 instances found
```

#### **SECURITY TRACE**

Modifies the trace level for the EntireX Security (security-specific attribute TRACE-LEVEL). Broker-specific attribute SECURITY=YES must be set.

#### Example

- To set a trace level 2 for EntireX Security
- Enter command:

```
task_id SECURITY TRACE=2
```

See TRACE-LEVEL under Broker Attributes.

# **Transport-specific Commands**

Transport-specific commands are available for Adabas/Entire Net-Work communicators and TCP communicators; the COM command can be used for all communicators. The following command syntax applies:

$$task\_id \quad \left\{ \begin{array}{l} COM \\ NET \\ TCP \\ Tnn \end{array} \right\} \left\{ \begin{array}{l} STATUS \\ SUSPEND \\ RESUME \\ STOP \\ START \\ TRACE = \{0-8\} \end{array} \right\}$$

#### **COM** parameter

This command is executed by all configured transport communicators. The following parameters are supported:

Parameter	Description
STATUS	Displays the current status of the transport communicator.
SUSPEND	Used to suspend the transport communicator. The transport communicator is halted but will not shut down. User requests receive response code 148.
RESUME	Resume a suspended transport communicator. If the communicator was not suspended before, an error message will be displayed.
STOP	Stop an active or suspended transport communicator. The transport communicator will shut down. All transport-specific resources will be freed. User requests receive response code 148.
START	Start a transport communicator that was previously stopped. If the communicator was not stopped before, an error message will be displayed.
TRACE	Sets the trace level for the transport method. If the global trace level (see TRACE) is set with command $task\_id$ TRACE= $n$ this applies to $all$ transport methods. This command will also override any existing transport-specific settings. If you subsequently enter command $task\_id$ TCP TRACE= $n$ only the trace level for TCP/IP transport is modified.
	<b>Note:</b> With command TCP $\top nn$ , the trace level is set for <i>all</i> TCP communicators. Setting a trace level for a single TCP instance is not supported.

## Sample Output

```
ETBM0720 Operator typed in: COM STATUS
ETBW0718 TCP Communicator 0 currently active
ETBW0718 TCP Communicator 1 currently active
ETBW0718 NET Communicator 0 currently suspended
XC00039I 00113 Total number of commands = 17
XC00057I 00113 Operator entry active
ETBM0720 Operator typed in: COM SUSPEND
ETBM0721 TCP Communicator 0 suspended
ETBM0721 TCP Communicator 1 suspended
ETBM0721 NET Communicator 0 suspended
```

## **NET** parameter

This command is executed by X-COM, the Adabas/Entire Net-Work communicator. See command COM above for a list of supported parameters.

#### Sample Output

```
ETBM0720 Operator typed in: NET STATUS
ETBW0718 NET Communicator O currently active
XC00039I 00113 Total number of commands = 17
XC00057I 00113 Operator entry active
```

#### TCP parameter

This command is executed by TCP communicators. See command COM above for a list of supported parameters.

## Sample Output

```
ETBM0720 Operator typed in: TCP STATUS
ETBW0718 TCP Communicator 0 currently active
ETBW0718 TCP Communicator 1 currently active
```

```
ETBM0720 Operator typed in: TCP RESUME
ETBM0721 TCP Communicator 0 resumed
ETBM0721 TCP Communicator 1 resumed
```

To manipulate a specific communicator instance (max. five instances can be started), use the command T00, T01, T02, T03 or T04 for the respective TCP instance.

# Sample Output

```
ETBM0720 Operator typed in: T00 STATUS
ETBW0718 TCP Communicator 0 currently active
```

```
ETBM0720 Operator typed in: T01 STATUS
ETBW0718 TCP Communicator 1 currently active
```

# **Sample Transport Commands**

- > To display status of all transport communicators
- Enter command:

```
task_id COM STATUS
```

- > To suspend first TCP communicator
- Enter command:

task\_id T00 SUSPEND

# **XCOM-specific Commands**

**Note:** All operator commands beginning with "X" belong to X-COM, the Adabas/Entire Net-Work communicator. The following commands operate only on the Adabas transport mechanism: XCQES, XHALT, XPARM, XSTART, XSTAT and XUSER. These commands have no effect on functions not related to the Adabas transport mechanism.

XEND and XSTOP function independently of the transport mechanism. (They stop the Broker's processing immediately, whereby existing calls to the EntireX Broker are not allowed to finish.)

#### **XABS**

Displays the total size, the number of bytes in use, the number of free bytes and the largest free windows in the Adabas attached buffer pool on the console.

**Note:** This command operates on the Adabas transport mechanism only. It has no effect on functions not related to the Adabas transport mechanism.

#### Sample Output

```
ETBM0720 Operator typed in: XABS

XC00090I 10113 Attached buffer usage

XC00090I 10113 38912000 bytes total = 9500 NABS

XC00090I 10113 0 bytes used

XC00090I 10113 0 bytes used HWM

XC00090I 10113 38912000 bytes free

XC00090I 10113 38912000 bytes current largest free windows

XC00090I 10113 38912000 bytes minimum of all largest free windows
```

#### **XCQES**

Displays the current number, and the highest number, of Adabas command queue elements to the console.

**Note:** This command operates on the Adabas transport mechanism only. It has no effect on functions not related to the Adabas transport mechanism.

## Sample Output

```
ETBM0720 Operator typed in: XCQES
XC00030I 00113 Number of active CQEs = 0
XC00031I 00113 Highest number of active CQEs = 1
```

#### **XEND**

Alias of ETBEND.

#### **XHALT**

New calls to the EntireX Broker are temporarily rejected. Processing is resumed by issuing the XSTART operator command. XHALT is an alias for command NET SUSPEND.

**Note:** This command operates on the Adabas transport mechanism only. It has no effect on functions not related to the Adabas transport mechanism.

#### Sample Output

```
ETBM0720 Operator typed in: XHALT
ETBM0721 NET Communicator O suspended
```

#### **XPARM**

Displays the values of Adabas SVC, database ID, number of CQEs, number of attached buffers, and the application name for the Adabas transport to the console.

**Note**: This command operates on the Adabas transport mechanism only. It has no effect on functions not related to the Adabas transport mechanism.

## **Sample Output**

```
ETBM0720 Operator typed in: XPARM

XC00032I 00113 Parameters for this session:

XC00033I 00113 SVC = 249

XC00034I 00113 NODE = 00113

XC00035I 00113 NCQE = 00100

XC00036I 00113 NABS = 10000

XC00037I 00113 User application = ETBNUC
```

#### **XSTART**

Processing of new calls to the EntireX Broker, interrupted with the XHALT command, is resumed. XSTART is an alias of command NET RESUME.

**Note:** This command operates on the Adabas transport mechanism only. It has no effect on functions not related to the Adabas transport mechanism.

#### Sample Output

```
ETBM0720 Operator typed in: XSTART
ETBM0721 NET Communicator O resumed
```

#### **XSTAT**

Displays the EntireX Broker statistics as console messages.

**Note:** This command operates on the Adabas transport mechanism only. It has no effect on functions not related to the Adabas transport mechanism.

#### **XSTOP**

Alias of ETBEND.

#### **XUSER**

Displays the current number, as well as the highest number, of users actively issuing commands using the Adabas transport mechanism to the console.

**Note:** The number of users displayed with this operator command will not represent all of the Broker clients and servers but only the subset of users issuing commands using the Adabas transport mechanism. Command and Information Services provides comprehensive information about all Broker clients and servers.

114

# 7 Broker Command-line Utilities

ETBINFO	11	16
ETBCMD	12	22

EntireX Broker provides the following internal services: Command Service and Information Service, which can be used to administer and monitor brokers. Because these services are implemented internally, nothing has to be started or configured. You can use these services immediately after starting EntireX Broker.

#### **ETBINFO**

Queries the Broker for different types of information, generating an output text string with basic formatting. This text output can be further processed by script languages. ETBINFO uses data descriptions called profiles to control the type of data that is returned for a request. ETBINFO is useful for monitoring and administering EntireX Broker efficiently, for example how many users can run concurrently and whether the number of specified message containers is large enough.

Although basic formatting of the output is available, it is usually formatted by script languages or other means external to the Broker.

- Running the Command-line Utility
- Command-line Parameters
- Profile
- Format String
- Using SSL/TLS

## **Running the Command-line Utility**

In a z/VSE environment, run the command-line utility ETBINFO as shown below:

#### **Command-line Parameters**

The table below explains the command-line parameters. The format string and profile parameters are described in detail following the table. All entries in the Option column are case-sensitive.

Option	Command-line Parameter	Req/ Opt	Explanation		
- b	brokerid	R	Broker identifier, for example localhost:1971:TCP.		
- C	class	О	Class as selection of	criterion.	
- C		0	Create output with comma-separated values, suitable for input into a spreadsheet or other analysis tool. Any format string specified by means of format string or profile command-line parameters is ignored.		
- d	object	R	Possible values:		
			Object	Provides Info on	
			BROKER	Broker.	
			CLIENT	Client.	
			CMDLOG-FILTER	Command log filter.	
			CONVERSATION	Conversation.	
			NET	Entire Net-Work transport.	
			PARTICIPANT	Participant.	
			POOL-USAGE	Broker pool usage.	
			PSF	Unit-of-work status.	
			PSFADA	Adabas persistent store.	
			PSFCTREE	c-tree persistent store.	
			PSFDIV	DIV persistent store.	
			RESOURCE-USAGE	Broker resource usage.	
			SECURITY	EntireX Security.	
			SERVER	Server.	
			SERVICE	Service.	
			STATISTICS	Broker statistics.	
			TCP	TCP transport.	
			UOW-STATISTICS	Units of work per service.	
			USER	Participant (short).	
			WORKER	Worker.	
			WORKER-USAGE	Worker usage.	
- е	recv class	О	Receiver's class nar for object PSF.	ne. This selection criterion is valid only	
- f	Format String	0	Format string how	you expect the output. See <i>Profile</i> .	

Option	Command-line Parameter	Req/ Opt	Explanation			
- g	recv service	0	Receiver's service name. This selection criterion is valid only for object PSF.			
- h	help	0	Prints help information.			
- i	convid	0	Conversation ID as selection criterion. Only valid for object CONVERSATION.			
- I	conv type	0	Conversation's type.			
- j	recv server	О	Receiver's server name. This selection criterion is valid only for object PSF.			
- k	recv token	0	Receiver's token. This selection criterion is valid only for object PSF.			
- ]	level	О	The amount of information displayed:			
			FULL All information.  SHORT User-specific information.			
- m	recv userid	0	Receiver's user ID. This selection criterion is valid only for object PSF.			
- n	server name	0	Server name. This selection criterion is valid only for the objects SERVER, SERVICE or CONVERSATION.			
- p	library.sublibrary(profile.pro)	0	Here you can specify a sublibrary element that defines the layout of the output. There are default files you can modify or you can use your own. The default files are:			
			BROKER CLIENT CLOGFLT CONV NET			
			POOL PSF PSFADA PSFCTREE PSFDIV			
			SERVICE STATIS STATIS TCP			
			USER WORKER WKRUSAGE See <i>Profile</i> .			
- q	puserid	0	Physical user ID. This selection criterion is valid only for objects CLIENT, SERVER, CONVERSATION,			
			<b>Note:</b> Must be a hex value.			
- r	sec	0	Refresh information after seconds.			
- S	service	0	Service. This selection criterion is valid only for objects SERVER, SERVICE or CONVERSATION.			
-t	token	0	This selection criterion is valid only for objects CLIENT, SERVER, SERVICE or CONVERSATION.			
- u	userid	O	User ID. This selection criterion is only valid for the display types CLIENT, SERVER, SERVICE or CONVERSATION.			

Option	Command-line Parameter	Req/ Opt	Explanation
- V	UOW status	О	Unit of work status. This selection criterion is valid only for object PSF.
- W	UOW ID	0	Unit of work ID. This selection criterion is valid only for object PSF.
- X	userid	О	User ID. For security purposes.
- y	password	О	Password. For security purposes.
- Z	token	О	Used with userid to uniquely identify a caller to Command and Information Services.

#### **Profile**

If you do not use the profile option or a format string, your output will be an unformatted list with all columns of that display type. To display specific columns, specify a profile that includes only those columns.

The following default sample profiles include all the columns defined for each display type:

```
■ BROKER ■ POOL ■ PSFCTREE ■ SERVER ■ TCP
■ CLIENT ■ PSF ■ PSFDIV ■ SERVICE ■ USER
■ CLOGFLT ■ PSFADA ■ RESOURCE ■ STATIS ■ WKRUSAGE
■ CONV ■ SECURITY ■ WORKER
```

You can either delete the columns not required or copy the default profile and modify the order of the columns. Ensure that the column names have a leading "%". Column names can be written in one line or on separate lines. The output is always written side by side.

#### **Location of Profiles**

On z/VSE, the profiles used to control the format of the data displayed are members of the EXX960 sublibrary and are named SERVER.PRO, CLIENT.PRO etc.

Example of using a profile:

## **Format String**

The format string, if specified, will override the use of a profile. The format string is built like a printf() in C language. The string must be enclosed in quotation marks. You can specify the columns by using a "%" and the column name. The column name must contain letters only. Numeric characters are not allowed. You can specify the length of column output by using a format precision, as in the ANSI-C printf() function. The column name must be followed by a blank. For example:

```
// EXEC ETBINFO, PARM='ENVAR("LOGNAME=ENTIRE")/-b LOCALHOST:1971:TCP +
-d SERVICE', +
PARM='-f "CLASS: %24SERVER-CLASS SERVER: %24SERVER-NA+
ME SERVICE: %24SERVICE"'
```

#### which produces:

CLASS:	SAG	SERVER:	ETBCIS	SERVICE:	Ų
INFO CLASS:	SAG	SERVER:	ETBCIS	SERVICE:	<b>↓</b>
USER-INFO CLASS:	SAG	SERVER:	ETBCIS	SERVICE:	ب
CMD	SAG	SERVER:	ETBCIS	SERVICE:	<b>ب</b>
PARTICIPANT-SHUTDOWN CLASS:	SAG	SFRVFR:	FTBCIS	SERVICE:	ىد
SECURITY-CMD	JAU	JENVEN.	L10013	JLIN I OL.	

#### Example:

#### which produces:

```
z/VSE 5.1.2 12 200
```

You can also use an arbitrary column separator, which can be any character other than "%". You can use  $\n$  for a new line in the output and  $\t$  for a tabulator in the format string or profile. Please note that due to the PARM string syntax in the z/VSE EXEC command,  $\n$  becomes  $\n$ . For example:

## which produces:

```
CLASS: SAG
SERVER: ETBCIS
SERVICE: INFO

CLASS: SAG
SERVER: ETBCIS
SERVICE: USER-INFO

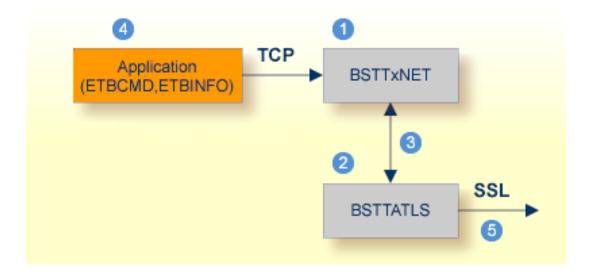

CLASS: SAG
SERVER: ETBCIS
SERVICE: CMD

CLASS: SAG
SERVER: ETBCIS
SERVICE: PARTICIPANT-SHUTDOWN

CLASS: SAG
SERVER: ETBCIS
SERVICE: SECURITY-CMD
```

# **Using SSL/TLS**

Together with SSL parameters (to provide certificates), define ATLS rules for socket interception in the ATLS daemon startup job BSTTATLS 2. If the rules match, the socket connection is turned into an SSL connection 5. Refer to your IBM documentation for further information. For an overview, refer to the IBM Redbook *Enhanced Networking on IBM z/VSE*; for a more detailed description, refer to *BSI SSL Installation, Programming and User's Guide*.

- 1 BSI TCP/IP Stack, either BSTTINET (IPv4) or BSTT6NET (IPv6).
- 2 ATLS rules are defined manually. See *Sample ATLS Daemon Configuration* below.
- 3 BSTTATLS is associated with a TCP/IP stack.
- 4 Application using a TCP connection.
- 6 BSTTATLS intercepts outbound TCP connection and converts it to SSL connection. For inbound, SSL connections can also be intercepted and converted to TCP connections.

#### To set up SSL with ATLS

- To operate with SSL, certificates need to be provided and maintained. Depending on the platform, Software AG provides default certificates, but we strongly recommend that you create your own. See *SSL/TLS Sample Certificates Delivered with EntireX* in the EntireX Security documentation.
- Set up the tool for a TCP/IP connection. On mainframe platforms, use *Transport-method-style Broker ID*. Example:

```
ETB024:1699:TCP
```

- Configure AT-TLS to turn the TCP/IP connection to an SSL connection, using a client to interact with the z/OS Management Facility (z/OSMF). The outcome of this configuration is a Policy Repository with AT-TLS rules stored as z/OS files. This file is the configuration file for the Policy Agent, MVS task PAGENT.
- 4 Make sure the broker is prepared for SSL connections as well. See *Running Broker with SSL/TLS Transport* in the platform-specific Administration documentation.

#### Sample ATLS Daemon Configuration

```
* Converting inbound EntireX Broker connection

* Converts listen port 1971 to SSL listen port 1972

OPTION SERVER

ATTLS 1971 AS 2071 SSL

*

* Converting outbound client connection

* Converts connect to 192.168.2.100:1972:TCP to 192.168.2.100:2072:SSL

OPTION CLIENT

ATTLS 1972 TO 192.168.2.100 AS 2072 SSL
```

**Note:** We recommend setting SETPARM value SUBTASK to a value greater than 0 in the ATLS daemon startup job (valid values 0-16, default=0). For example:

# // SETPARM SUBTASK=8

See also BSI SSL Installation, Programming and User's Guide.

# **ETBCMD**

Allows the user to take actions - for example purge a unit of work, stop a server, shut down a Broker - against EntireX Broker.

- Running the Command-line Utility
- Command-line Parameters
- List of Commands and Objects
- Examples
- Using SSL/TLS

#### Running the Command-line Utility

In a z/VSE environment, run the ETBCMD command-line utility like this:

#### **Command-line Parameters**

The table below explains the command-line parameters. All entries in the **Option** column are case-sensitive.

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
brokerid	- b	e.g. ETB001	R	Broker ID.
command	- C	ALLOW-NEWUOWMSGS	R	Command to be performed. See <i>List</i>
		CLEAR-CMDLOG-FILTER		of Commands and Objects below.
		■ CONNECT-PSTORE		
		■ DISABLE-ACCOUNTING		

■ DISABLE-CMDLOG-FILTER ■ DISABLE-CMDLOG ■ DISABLE-DYN-WORKER	
■ DISABLE-DYN-WORKER	
■ DISCONNECT-PSTORE	
■ ENABLE-ACCOUNTING	
■ ENABLE-CMDLOG-FILTER	
■ ENABLE-CMDLOG	
■ ENABLE-DYN-WORKER	
■ FORBID-NEWUOWMSGS	
■ PING	
■ PRODUCE-STATISTICS	
■ PURGE	
■ RESET-USER	
■ RESUME	
■ SET-CMDLOG-FILTER	
■ SHUTDOWN	
■ START	
■ STATUS	
■ STOP	
■ SUSPEND	
■ SWITCH-CMDLOG	
■ TRACE-FLUSH	
■ TRACE-OFF	
■ TRACE-ON	
■ TRAP-ERROR	
object type	The object type to be operated on.
■ CONVERSATION	See <i>List of Commands and Objects</i> below. Within EntireX Broker
■ PARTICIPANT	nomenclature, a participant is an
■ PSF	application implicitly or explicitly
■ SECURITY	logged on to the Broker as a specific user. See <i>Implicit Logon</i> and <i>Explicit</i>
■ SERVER	Logon. A participant could act as
■ SERVICE	client or server.
■ TRANSPORT	

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
	- e	errornumber	0	Error number being trapped.
	- E		О	Exclude attach servers from service shutdown.
help	-h		0	Prints help information.
class/server/service	-n	class/server/service	0	Service triplet.
option	- 0	■ ACCEPTED	0	Command option.
		■ CANCELLED		
		■ IMMED		
		■ QUIESCE		
		■ LEVEL $n$ , where $n$ =1-8		
puserid	- p	puserid	O	Physical User ID. For SERVER and PARTICIPANT objects only. This must be a hex value.
seqno	- S	sequence number	0	Sequence number of participant.
token	-t	token	0	Token. For PARTICIPANT object only.
uowid	- u	uowid	О	Unit of work ID. For PSF object only.
userid	- U	userid	0	User ID. For PARTICIPANT object only.
secuserid	- X	userid	0	User ID for security purposes.
transportid	- X	Transport ID	0	One of the following: $COM \mid NET \mid TCP \mid Tnn$ . See table below.
secpassword	- y	password	О	Password for security purposes.

# **Transport ID Values**

This table explains the possible values for parameter transportid:

Transport ID	Explanation
СОМ	all communicators
NET	NET transport communicator
TCP	all TCP/IP communicators
Т00	TCP/IP communicator 1
T01	TCP/IP communicator 2
T02	TCP/IP communicator 3
Т03	TCP/IP communicator 4
T04	TCP/IP communicator 5

# **List of Commands and Objects**

This table lists the available commands and the objects to which they can be applied.

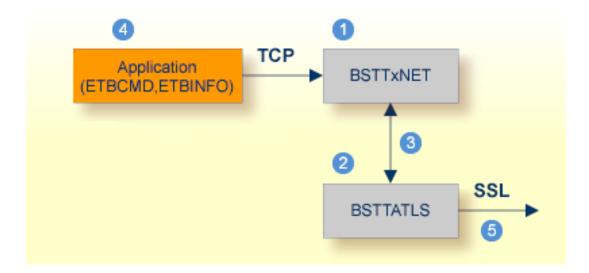

Object								
Command	BROKER	CONVERSATION	PARTICIPANT	PSF	SECURITY	SERVER	SERVICE	TRANSPORT
ALLOW-NEWUOWMSGS				х				
CLEAR-CMDLOG-FILTER	х							
CONNECT-PSTORE				х				
DISABLE-ACCOUNTING	x							
DISABLE-CMDLOG-FILTER	х							
DISABLE-CMDLOG	x							
DISABLE-DYN-WORKER	х							
DISCONNECT-PSTORE				х				
ENABLE-ACCOUNTING	x							
ENABLE-CMDLOG-FILTER	х							
ENABLE-CMDLOG	х							
ENABLE-DYN-WORKER	х							
FORBID-NEWUOWMSGS				х				
PING	х							
PRODUCE-STATISTICS	х							
PURGE				х				
RESET-USER					х			
RESUME								х
SET-CMDLOG-FILTER	х							
SHUTDOWN	х	х	x			х	х	
START								x
STATUS								х
STOP								х
SUSPEND								х
SWITCH-CMDLOG	х							
TRACE-FLUSH	х							
TRACE-OFF	х			х	х			
TRACE-ON	х			х	х			
TRAP-ERROR	х							

# Examples

ETBCMD Example PARM Strings	Description
PARM='ENVAR("LOGNAME=ENTIRE")/-h'	Displays ETBCMD help text.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d BROKER -c TRACE-OFF'	Turns Broker tracing off.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d BROKER -c TRACE-ON -o LEVEL2'	Sets Broker trace level to 2.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d BROKER -c SHUTDOWN'	Performs Broker shutdown.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d SERVICE -c SHUTDOWN -o IMMED -n ACLASS/ASERVER/ASERVICE'	Shutdown service CLASS=ACLASS, SERVER=ASERVER, SERVICE=ASERVICE. See also SHUTDOWN SERVICE for more information on shutdown options.
	Create list of servers and shutdown specific server in two steps (first step uses ETBINFO). See also SHUTDOWN SERVER.
EXEC ETBINFO, PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d SERVER -l FULL -f"%USER-ID %SEQNO"'	1. Determine a list of all servers with sequence numbers.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d SERVER -c SHUTDOWN -o IMMED -S32'	2. Shutdown server with sequence number 32.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d BROKER -c PING'	Performs an EntireX ping against the Broker.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d PSF -c DISCONNECT-PSTORE'	Disconnects the Broker PSTORE.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d PSF -c CONNECT-PSTORE'	Connects the Broker PSTORE.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d PSF -c PURGE -u 10000000000001A'	Purges a unit of work.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d PSF -c ALLOW-NEWUOWMSGS'	Allows new units of work to be stored.
PARM='ENVAR("LOGNAME=ENTIRE")/-b etb001 -d PSF -c FORBID-NEWUOWMSGS'	Disallows new units of work to be stored.

#### Using SSL/TLS

Together with SSL parameters (to provide certificates), define ATLS rules for socket interception in the ATLS daemon startup job BSTTATLS 2. If the rules match, the socket connection is turned into an SSL connection 5. Refer to your IBM documentation for further information. For an overview, refer to the IBM Redbook *Enhanced Networking on IBM z/VSE*; for a more detailed description, refer to *BSI SSL Installation, Programming and User's Guide*.

- 1 BSI TCP/IP Stack, either BSTTINET (IPv4) or BSTT6NET (IPv6).
- ② ATLS rules are defined manually. See Sample ATLS Daemon Configuration below.
- 3 BSTTATLS is associated with a TCP/IP stack.
- 4 Application using a TCP connection.
- **6** BSTTATLS intercepts outbound TCP connection and converts it to SSL connection. For inbound, SSL connections can also be intercepted and converted to TCP connections.

#### > To set up SSL with ATLS

- To operate with SSL, certificates need to be provided and maintained. Depending on the platform, Software AG provides default certificates, but we strongly recommend that you create your own. See *SSL/TLS Sample Certificates Delivered with EntireX* in the EntireX Security documentation.
- Set up the tool for a TCP/IP connection. On mainframe platforms, use *Transport-method-style Broker ID*. Example:

ETB024:1699:TCP

- Configure AT-TLS to turn the TCP/IP connection to an SSL connection, using a client to interact with the z/OS Management Facility (z/OSMF). The outcome of this configuration is a Policy Repository with AT-TLS rules stored as z/OS files. This file is the configuration file for the Policy Agent, MVS task PAGENT.
- 4 Make sure the broker is prepared for SSL connections as well. See *Running Broker with SSL/TLS Transport* in the platform-specific Administration documentation.

#### Sample ATLS Daemon Configuration

```
* Converting inbound EntireX Broker connection

* Converts listen port 1971 to SSL listen port 1972

OPTION SERVER

ATTLS 1971 AS 2071 SSL

*

* Converting outbound client connection

* Converts connect to 192.168.2.100:1972:TCP to 192.168.2.100:2072:SSL

OPTION CLIENT

ATTLS 1972 TO 192.168.2.100 AS 2072 SSL
```

**Note:** We recommend setting SETPARM value SUBTASK to a value greater than 0 in the ATLS daemon startup job (valid values 0-16, default=0). For example:

// SETPARM SUBTASK=8

See also BSI SSL Installation, Programming and User's Guide.

# 8 Configuring Broker for Internationalization

Configuring ICU Conversion	132
Writing Translation User Exits	
Configuring Translation User Exits	
Configuring Translation	

Software internationalization is the process of designing products and services so that they can be adapted easily to a variety of different local languages and cultures. Internationalization within EntireX means internationalization of messages: the incoming and outgoing messages are converted to the desired codepage of the platform in use. This chapter explains in detail how to configure the broker for character conversion.

See also Internationalization with EntireX.

# **Configuring ICU Conversion**

#### > To configure ICU conversion

In the Broker attribute file, set the ICU-CONVERSION (default for z/VSE is NO):

ICU-CONVERSION=YES

- In the Broker attribute file, set the service-specific attribute CONVERSION. Default for z/VSE is NO. Examples:
  - ICU Conversion with SAGTCHA for *ACI-based Programming*:

CONVERSION=(SAGTCHA, OPTION=SUBSTITUTE)

■ ICU Conversion with SAGTRPC for RPC-based Components and Reliable RPC:

CONVERSION=(SAGTRPC,OPTION=STOP)

3 Optionally configure a CONVERSION OPTION to tune error behavior to meet your requirements; see *OPTION Values for Conversion*.

#### > To configure locale string defaults (optional)

■ If the broker's locale string defaults do not match your requirements (see *Broker's Locale String Defaults*), we recommend you assign suitable locale string defaults for your country and region, see the respective attribute in *Codepage-specific Attributes* for how to customize the broker's locale string defaults.

#### To customize mapping of locale strings (optional)

If the built-in locale string mapping mechanism does not match your requirements, you can assign specific codepages to locale strings. See *Broker's Built-in Locale String Mapping* and locale-string for information on customizing the mapping of locale strings to codepages.

# **Writing Translation User Exits**

This section covers the following topics:

- Introduction
- Structure of the TRAP Control Block
- Using the TRAP Fields

#### Introduction

EntireX Broker provides an interface to enable user-written translation routines in the programming language. It contains three parameters:

- The address of the TRAP control block (TRAP = Translation Routine / Area for Parameters).
- The address of a temporary work area. It is aligned to fullword / long integer boundary (divisible by 4). The work area can only be used for temporary needs and is cleared after return.
- A fullword (long integer) that contains the length of the work area.
- **Note:** Names for user-written translation routines starting with "SAG" are reserved for Software AG usage and must not be used, e.g. "SAGTCHA" and "SAGTRPC".

#### Structure of the TRAP Control Block

The Assembler dummy section TR\$TRAP covers the layout of the TRAP control block:

```
TR$TRAP DSECT,
TR$TYPE DS
                              TRAP type
                 2
                              TRAP type ETB 121
TR$TYP2 EQU
TR$ILEN DS
                              Input buffer length
TR$IBUF DS
                 Α
                              Address of input buffer
                 F
                              Output buffer length
TR$OLEN DS
TR$OBUF DS
                 Α
                              Address of output buffer
TR$DLEN DS
                              Length of data returned:
                              Should be set to the minimum value of TR$ILEN
                              and TR$OLEN.
TR$SHOST DS
                              Sender's host:
                              x'00000000' = little endian
                              x'00000001' = big endian
TR$SCODE DS
                              Sender's character set:
                 X'00000022'
                              EBCDIC (IBM)
SEBCIBM EQU
SEBCSNI EQU
                 X'00000042'
                              EBCDIC (SNI)
SA88591 EQU
                 X'00000080'
                              ASCII
TR$RHOST DS

TR\$SENVA	DS	F	Sender's ENVIRONMENT field supplied:
OFF	EQU	X'00000000'	ENVIRONMENT field not set
ON	EQU	X'00000001'	ENVIRONMENT field set
*			
TR\$RENVA	DS	F	Receiver's ENVIRONMENT field supplied:
*			> see TR\$SENVA
TR\$SENV	DS	CL32	Sender's ENVIRONMENT field
TR\$RENV	DS	CL32	Receiver's ENVIRONMENT field
TR\$LEN	EQU	*-TR\$TRAP	Length of TRAP

#### Using the TRAP Fields

The TR\$DLEN must be supplied by the user-written translation routine. It tells the Broker the length of the message of the translation. In our example its value is set to the minimum length of the input and output buffer.

All other TRAP fields are supplied by the Broker and must not be modified by the user-written translation routine.

The incoming message is located in a buffer pointed to by TR\$IBUF. The length (not to be exceeded) is supplied in TR\$ILEN. The character set information from the send buffer can be taken from TR\$SCODE.

The outgoing message must be written to the buffer pointed to by TR\$OBUF. The length of the output buffer is given in the field TR\$OLEN. The character set is specified in TR\$RCODE. If the addresses given in TR\$IBUF and TR\$OBUF point to the same location, it is not necessary to copy the data from the input buffer to the output buffer.

The environment fields TR\$SENVA and TR\$RENVA are provided to handle site-dependent character set information. For the SEND and/or RECEIVE functions, you can specify data in the ENVIRONMENT field of the Broker ACI control block. This data is translated into the codepage of the platform where EntireX Broker is running (see field TR\$BCODE) and is available to the TR\$SENV or TR\$RENV field in the TRAP control block. TR\$SENVA or TR\$RENVA are set to 0N if environmental data is available. Any values given in the API field ENVIRONMENT must correspond to the values handled in the translation routine.

# **Configuring Translation User Exits**

#### To configure translation user exits

As a prerequisite, the user-written translation module must be accessible to the Broker worker threads.

1 Copy the user-written translation module into any sublibrary defined to EntireX Broker's LIBDEF chain.

2 In the Broker attribute file, set the service-specific attribute TRANSLATION to the name of the user-written translation routine. Example:

TRANSLATION=MYTRANS

# **Configuring Translation**

# > To configure translation

■ In the Broker attribute file, set the service-specific attribute TRANSLATION to SAGTCHA as the name of the translation routine. Example:

TRANSLATION=SAGTCHA

# 9 Managing the Broker Persistent Store

Implementing an Adabas Database as Persistent Store	1	38
Migrating the Persistent Store	1	44

The persistent store is used for storing unit-of-work messages to disk. This means message and status information can be recovered after a hardware or software failure to the previous commit point issued by each application component. Under z/VSE, the broker persistent store can be implemented with the Adabas database of Software AG. This chapter covers the following topics:

See also Concepts of Persistent Messaging.

# Implementing an Adabas Database as Persistent Store

- Introduction
- Configuring and Operating the Adabas Persistent Store
- Adabas DBA Considerations

#### Introduction

EntireX provides an Adabas persistent driver. This enables Broker unit of work (UOW) messages and their status to be stored in an Adabas file. It is designed to work with Adabas databases under z/OS, UNIX, Windows, BS2000 and z/VSE, and can be used where the database resides on a different machine to Broker kernel. For performance reasons, we recommend using EntireX Broker on the same machine as the Adabas database.

## **Configuring and Operating the Adabas Persistent Store**

#### **Selecting the Adabas Persistent Store Driver**

To create an Adabas Persistent Store, adapt and run job PSFADA. J in sublibrary EXX960. Running this job will load an empty Adabas persistent store file into your Adabas database. To activate the Adabas persistent store, set up at least following parameters in the broker attribute file. See *Broker Attributes*.

```
DEFAULTS=BROKER

STORE = BROKER

PSTORE = HOT/COLD

PSTORE-TYPE = ADABAS

DEFAULTS=ADABAS

DBID = dbid

FNR = pstore_file_number

DEFAULTS=NET

ADASVC = svc_number
```

See Managing the Broker Persistent Store for more information.

#### Restrictions

If a HOT start is performed, the Broker kernel must be executed on the same platform on which also the previous Broker executed. This is because some portions of the persistent data are stored in the native character set and format of the Broker kernel. It is also necessary to start Broker with the same Broker ID as the previous Broker executed.

If a COLD start is executed, a check is made to ensure the Broker ID and platform information found in the persistent store file is consistent with the Broker being started (provided the persistent store file is not empty). This is done to prevent accidental deletion of data in the persistent store by a different Broker ID. If you intend to COLD start Broker and to utilize a persistent store file which has been used previously by a different Broker ID, you must supply the additional PSTORE-TYPE parameter FORCE-COLD=Y.

#### Recommendations

- Perform regular backup operations on your Adabas database. The persistent store driver writes C1 checkpoint records at each start up and shut down of Broker.
- For performance reasons, execute Broker on the same machine as Adabas.

#### **Broker Checkpoints in Adabas**

During startup, Broker writes the following C1 checkpoint records to the Adabas database. The time, date and job name are recorded in the Adabas checkpoint log. This enables Adabas protection logs to be coordinated with Broker executions. This information can be read from Adabas, using the ADAREP utility with option CPLIST:

Broker Execution Name	Broker Execution Type	Adabas
ETBC	Broker Cold Start	Normal Cold Start
ETBH	Broker Hot Start	Normal Hot Start
ETBT	Broker Termination	Normal Termination

#### **Adabas DBA Considerations**

- BLKSIZE: Adabas Persistent Store Parameter for Broker
- Table of Adabas Parameter Settings
- Estimating the Number of Records to be Stored
- Estimating the Number of Records to be Stored
- Tips on Transports, Platforms and Versions

#### **BLKSIZE**: Adabas Persistent Store Parameter for Broker

Caution should be exercised when defining the block size (BLKSIZE) parameter for the Adabas persistent store. This determines how much UOW message data can be stored within a single Adabas record. Therefore, do not define a much larger block size than the size of the maximum unit of work being processed by Broker. (Remember to add 41 bytes for each message in the unit of work.) The advantage of having a good fit between the unit of work and the block size is that fewer records are required for each I/O operation.

It is necessary to consider the following Adabas parameters and settings when using Adabas for the persistent store file:

## **Table of Adabas Parameter Settings**

Topic	Description
Allowing Sufficient Adabas UQ Elements	Allow sufficient Adabas user queue (UQ) elements each time you start Broker. The Broker utilizes a number of user queue elements equal to the number of worker tasks (NUM-WORKER), plus two. Adabas timeout parameter (TNAE) determines how long the user queue elements will remain. This can be important if Broker is restarted after an abnormal termination, and provision must be made for sufficient user queue elements in the event of restarting Broker.
Setting Size of Hold Queue Parameters	Consideration must be given to the Adabas hold queue parameters NISNHQ and NH. These must be sufficiently large to allow Adabas to add/update/delete the actual number of records within a single unit of work.  Example: where there are 100 message within a unit of work and the average message size is 10,000 bytes, the total unit of work size is 1 MB. If, for example, a 2 KB block size (default BLKSIZE=2000) is utilized by the Adabas persistent store driver, there will be 500 distinct records within a single Adabas commit (ET) operation, and provision must be made for this to occur successfully.
Setting Adabas TT Parameter	Consideration must be given to the Adabas transaction time (TT) parameter for cases where a large number of records is being updated within a single unit of work.
Defining LWP Size	Sufficient logical work pool (LWP) size must be defined so that the Adabas persistent store can update and commit the units of work. Adabas must

Topic	Description
	be able to accommodate this in addition to any other processing for which it is used.
Executing Broker Kernel and Adabas Nucleus on Separate Machines	If Broker kernel is executed on a separate machine to the Adabas nucleus, with a different architecture and codepage, then we recommend running the Adabas nucleus with the UEC (universal conversion) option in order to ensure that Adabas C1 checkpoints are legible within the Adabas checkpoint log.
Setting INDEXCOMPRESSION=YES	This Adabas option can be applied to the Adabas file to reduce by approximately 50% the amount of space consumed in the indexes.
4-byte ISNs	If you anticipate having more than 16 million records within the persistent store file, you must use 4-byte ISNs when defining the Adabas file for EntireX.
Specification of Adabas LP Parameter	<b>Caution:</b> This parameter must be specified large enough to allow the largest UOW to be stored in Adabas.
	If this is not large enough, Broker will detect an error (response 9; subresponse - 4 bytes - X'0003',C'LP') and Broker will not be able to write any further UOWs.
	See the description of the LP parameter under <i>ADARUN Parameters</i> in the <i>DBA Reference Summary</i> of the Adabas documentation.

### Estimating the Number of Records to be Stored

To calculate the Adabas file size it is necessary to estimate the number of records being stored. As an approximate guide, there will be one Adabas record (500 bytes) for each unprocessed unit of work, plus also n records containing the actual message data, which depends on the logical block size and the size of the unit of work. In addition, there will be one single record (500 bytes) for each unit of work having a persisted status.

Always allow ample space for the Adabas persistent store file since the continuous operation of Broker relies of the availability of this file to store and retrieve information.

#### Estimating the Number of Records to be Stored

In this example there are 100,000 Active UOW records at any one time. Each of these is associated with two message records containing the message data. UOW records are 500 bytes in length. Each message record contains 2,000 bytes. In addition, there are 500,000 UOW status records residing in the persistent store, for which the UOW has already been completely processed. These are 500 bytes long.

**Note**: The actual size of the data stored within the UOW message records is the sum of all the messages within the UOW, plus a 41-byte header for each message. Therefore, if the average message length is 59 bytes, the two 2,000 bytes, messages records, could contain n

= 4,000 / (59+41), or 40 messages. Adabas is assumed to compress the message data by 50% in the example (this can vary according to the nature of the message data).

3-byte ISNs and RABNs are assumed in this example. A device type of 8393 is used; therefore, the ASSO block size is 4,096, and DATA block size is 27,644. Padding factor of 10% is specified.

The following example calculates the space needed for Normal Index (NI), Upper Index (UI), Address Converter (AC) and Data Storage (DS).

Calculation Factors	Required Space
Number entries for descriptor WK	■ = number UOW records: 0.1 + 0.5 million
(21-byte unique key)	+ number message records: 0.2 million
■ NI Space for descriptor WK	■ = 800,000 * (3 + 21 + 2)
(3-byte ISN)	$\blacksquare$ = 20,800,000 bytes
(4,092 ASSO block 10% padding)	■ = 5,648 blocks
■ UI Space for descriptor WK	<b>=</b> 5,648 * (21 + 3 + 3 + 1)
■ (3-byte ISN + 3-byte RABN)	■ = 158,140 bytes
(4,092 ASSO block 10% padding)	■ = 43 blocks
Number entries for descriptor WI  (8-byte unique key)	= number processed UOW records: 0.5 million
■ NI Space for descriptor WI	<b>=</b> 500,000 * (3 + 8 + 2)
(3-byte ISN)	■ = 6,500,000 bytes
■ (4,092 ASSO block 10% padding)	■ = 1,765 blocks
■ UI Space for descriptor WI	<b>=</b> 17,649 * (8 + 3 + 3 + 1)
(3-byte ISN and 3 byte RABN)	■ = 26,475 bytes
(4,092 ASSO block 10% padding)	■ = 8 blocks
■ Number entries for descriptor WL	■ = number UOW records 0.1 + 0.5 million
(96 byte key)	
■ NI Space for descriptor WL	<b>=</b> 600,000 * (3 + 96 + 2)
(3-byte ISN)	■ = 60,600,000 bytes
■ (4,092 ASSO block 10% padding)	■ = 16,455 blocks
■ UI Space for descriptor WL	<b>=</b> 164,548 * (96 + 3 + 3 + 1)
(3-byte ISN and 3 byte RABN)	■ = 16,948,517 bytes

Calculation Factors	Required Space
(4,092 ASSO block 10% padding)	■ = 461 blocks
Address Converter space	<b>=</b> = (800,000 + 1) * 3 / 4092
(4,092 ASSO block)	■ = 587 blocks
■ Data storage for message data	= 0.2 million * 2000 * 0.5 = 200,000,000 bytes
(2,000-byte records compressed by 50%)	
■ Data storage for UOW data	= = 0.6 million * 500 * 0.5 = 150,000,000 byte
(2,000-byte records compressed by 50%)	
Combined space required for data	■ = 14,068 blocks
(27,644 DATA block 10% padding)	
Entity Requiring Space	Total Required Space
Normal Index (NI)	= 23,868 blocks
Upper Index (UI)	= 512 blocks
Data Storage (DS)	= 14,068 blocks
Address Converter (AC)	= 587 blocks

### Tips on Transports, Platforms and Versions

### **■** Entire Net-Work

If you intend to use Adabas persistent store through Entire Net-Work, see the Entire Net-Work documentation for installation and configuration details.

### Adabas Versions

Adabas persistent store can be used on all Adabas versions currently released and supported by Software AG.

### ■ Prerequisite Versions of Entire Net-Work with Adabas

See the Adabas and Entire Net-Work documentation to determine prerequisite versions of Entire Net-Work to use with Adabas at your site.

### **Migrating the Persistent Store**

The contents of EntireX Broker's persistent store can be migrated to a new persistent store in order to change the PSTORE type or to use the same type of PSTORE with increased capacity.

The migration procedure outlined here requires two Broker instances started with a special RUN-MODE parameter. One Broker unloads the contents of the persistent store and transmits the data to the other Broker, which loads data into the new PSTORE. Therefore, for the purposes of this discussion, we will refer to an *unload* Broker and a *load* Broker.

This procedure is based on Broker-to-Broker communication to establish a communication link between two Broker instances. It does not use any conversion facilities, since the migration procedure is supported for homogeneous platforms only.

- Configuration
- Migration Procedure

### Configuration

The migration procedure requires two Broker instances started with the RUN-MODE parameter. The unload Broker should be started with the following attribute:

RUN-MODE=PSTORE-UNLOAD

The load Broker should be started with the following attribute:

RUN-MODE=PSTORE-LOAD

These commands instruct the Broker instances to perform the PSTORE migration.

**Note:** The attribute PARTNER-CLUSTER-ADDRESS must be defined in both Broker instances to specify the transport address of the load Broker. The unload Broker must know the address of the load broker, and the load Broker must in turn know the address of the unload Broker.

### **Example:**

Broker ETB001 performs the unload on host HOST1, and Broker ETB002 performs the load on host HOST2. The transmission is based on TCP/IP. Therefore, Broker ETB001 starts the TCP/IP communicator to establish port 1971, and Broker ETB002 starts the TCP/IP communicator to establish port 1972.

For ETB001, attribute PARTNER-CLUSTER-ADDRESS=HOST2:1972:TCP is set, and for ETB002, attribute PARTNER-CLUSTER-ADDRESS=HOST1:1971:TCP is set to establish the Broker-to-Broker communication between the two Broker instances.

In addition to attributes RUN-MODE and PARTNER-CLUSTER-ADDRESS, a fully functioning Broker configuration is required when starting the two Broker instances. To access an existing PSTORE on the unloader side, you must set the attribute PSTORE=HOT. To load the data into the new PSTORE on the loader side, you must set the attribute PSTORE=COLD. The load process requires an empty PSTORE at the beginning of the load process.

**Note:** Use caution not to assign PSTORE=COLD to your unload Broker instance, as this startup process will erase all data currently in the PSTORE.

For the migration process, the unload Broker and the load Broker must be assigned different persistent stores.

A report can be generated to detail all of the contents of the existing persistent store. At the end of the migration process, a second report can be run on the resulting new persistent store. These two reports can be compared to ensure that all contents were migrated properly. To run these reports, set the attribute PSTORE-REPORT=YES. See PSTORE for detailed description, especially for the file assignment.

### Migration Procedure

The migration procedure is made up of three steps.

### Step 1

The unload Broker and the load Broker instances can be started independently of each other. Each instance will wait for the other to become available before starting the unload/load procedure.

The unload Broker instance sends a handshake request to the load Broker instance in order to perform an initial compatibility check. This validation is performed by Broker according to platform architecture type and Broker version number. The handshake ensures a correctly configured partner cluster address and ensures that the user did not assign the same PSTORE to both Broker instances. If a problem is detected, an error message will be issued and both Broker instances will stop.

### Step 2

The unload Broker instance reads all PSTORE data in a special non-destructive raw mode and transmits the data to the load Broker instance. The load Broker instance writes the unchanged raw data to the new PSTORE. A report is created if PSTORE-REPORT=YES is specified, and a valid output file for the report is specified.

### Step 3

The unload Broker instance requests a summary report from the load Broker instance to compare the amount of migrated data. The result of this check is reported by the unload Broker instance and the load Broker instance before they shut down.

When a Broker instances is started in RUN-MODE=PSTORE-LOAD or RUN-MODE=PSTORE-UNLOAD, the Broker instances only allow Administration requests. All other user requests are prohibited.

#### Notes:

- 1. The contents of the persistent store are copied to the new persistent store as an exact replica. No filtering of unnecessary information will be performed, for example, UOWs in received state. The master records will not be updated.
- 2. Before restarting your Broker with the new persistent store, be sure to change your PSTORE attribute to PSTORE=HOT. *Do not* start your broker with the new persistence store using PSTORE=COLD; this startup process will erase all of the data in your persistent store.
- 3. After completing the migration process and restarting your broker in a normal run-mode, it is important not to bring both the new PSTORE and the old PSTORE back online using separate Broker instances; otherwise, applications would receive the same data twice. Once the migration process is completed satisfactorily, and is validated, the old PSTORE contents should be discarded.

## Tracing EntireX Components under z/VSE

Tracing EntireX Broker	14	18
Tracing Broker Stubs		
Activating Tracing for the RPC Server	14	Ę

## **Tracing EntireX Broker**

### > To switch on tracing

- Set the attribute TRACE-LEVEL in the broker attribute file
  - for minimal trace output to "1"
  - for detailed trace output to "2"
  - for full trace output to "3"

Example:

TRACE-LEVEL=2

### > To switch off tracing

■ Set the attribute TRACE-LEVEL in the broker attribute file to 0:

TRACE-LEVEL=0

Or:

Omit the TRACE-LEVEL attribute.

## **Tracing Broker Stubs**

The broker stubs provide an option for writing trace files. Trace output is only available for transport method TCP.

### > To switch on tracing for the broker stub

■ Before starting the client application, set the environment variable STUBLOG in your application job control or CICS startup:

148

Trace Value	Trace Level	Description	
0	NONE	No tracing.	
1	STANDARD	aces initialization, errors, and all ACI request/reply strings.	
2	ADVANCED	Used primarily by system engineers, traces everything from level 1 and provides additional information - for example the Broker ACI control block - as well as transport information.	
3	SUPPORT	This is full tracing through the stub, including detailed traces of control blocks, message information, etc.	

### Example:

### //SETPARM STUBLOG=2

If the trace level is greater than 1, unencrypted contents of the send/receive buffers may be exposed in the trace.

Trace output is written to SYSOUT.

Remember to switch off tracing to prevent trace files from filling up your disk.

- > To switch off tracing for the broker stub
- Set the environment variable STUBLOG to NONE or remove the SETPARM statement.

## **Activating Tracing for the RPC Server**

- > To switch on tracing for the RPC server
- Set the parameter TRACELEVEL in the configuration file RPCPARM in sublibrary EXP960. Example:

TRACELEVEL=SUPPORT

To evaluate the return codes, see *Error Messages and Codes*.

## 11 Broker Shutdown Statistics

Shutdown Statistics Output	1	52
Table of Shutdown Statistics	1!	52

## **Shutdown Statistics Output**

After a successful Broker execution, shutdown statistics and related information are produced. This output is written in the following sequence:

- 1. The diagnostic message ETBD0444 is written into the Broker trace log.
- 2. The output i.e. statistics, internals and user-specified parameters is written into the end of the Broker trace log file at shutdown.

### **Table of Shutdown Statistics**

See *Legend* below for explanation of output type.

Output Type	Display Field	Description
U	Broker ID	Identifies the Broker kernel to which the attribute file applies. See BROKER-ID.
I	Version	The version of the Broker kernel currently running.
I	Generated platform family	The platform family for which this Broker kernel was built.
I	Runtime platform	The platform on which this Broker kernel is currently running.
I	Start time	The date and time when this Broker kernel started.
S	Restart count	The restart count indicates how many times the Broker kernel has been started with the persistent store. Therefore, after a cold start (PSTORE=COLD), the restart count will be 1. Then, after subsequent hot starts (PSTORE=HOT), the restart count will be 2 or greater.
U	Trace level	The value for the trace setting for this Broker kernel. See TRACE-LEVEL.
U	Worker tasks	The number of worker tasks for this Broker kernel. See NUM-WORKER.
U	MAX-MEMORY	The value of MAX-MEMORY or 0 if not defined. See MAX-MEMORY.
S	Memory allocated	Size of the allocated memory, in bytes.
S	Memory allocated HWM	Highest size of allocated memory in bytes since Broker started.
U	NUM-SERVICE	Value of NUM-SERVICE or 0 if not defined. See NUM-SERVICE.
S	Services active	The number of services currently active for this Broker kernel.
U	NUM-CLIENT	Value of NUM-CLIENT or 0 if not defined. See NUM-CLIENT.
S	Clients active	The number of clients currently active for this Broker kernel.
S	Clients active HWM	The high watermark for the number of clients active for this Broker kernel.

Output Type	Display Field	Description
U	NUM-SERVER	Value of NUM-SERVER or 0 if not defined. See NUM-SERVER.
S	Servers active	The number of servers currently active for this Broker kernel.
S	Servers active HWM	The high watermark for the number of servers active for this Broker kernel.
U	NUM-CONVERSATION	Value of NUM-CONVERSATION or 0 if not defined. See NUM-CONVERSATION.
S	Conversations active	The number of conversations currently active for this Broker kernel.
S	Conversations active HWM	The high watermark for the number of conversations active for this Broker kernel.
U	NUM-LONG-BUFFER	Value of NUM-LONG-BUFFER or 0 if not defined. See NUM-LONG-BUFFER.
S	Long buffers active	The number of long message buffers currently in use for this Broker kernel.
S	Long buffers active HWM	The high watermark for the number of long message buffers used for this Broker kernel.
U	NUM-SHORT-BUFFER	Value of NUM-SHORT-BUFFER or 0 if not defined. See NUM-SHORT-BUFFER.
S	Short buffers active	The number of short message buffers currently in use for this Broker kernel.
S	Short buffers active HWM	The high watermark for the number of short message buffers used for this Broker kernel.
U	Persistent store type	The type of persistent store used by this Broker kernel. See PSTORE-TYPE.
U	UOW persistence	Indicates whether units of work are persistent or not in this Broker kernel. See STORE.
U	Persistent store startup	Indicates the status of the persistent store at Broker startup. See PSTORE.
U	Persistent status lifetime	The multiplier to compute the lifetime of the persistent status. See UWSTATP.
U	Deferred UOWs allowed	Indicates whether or not deferred units of work are allowed. See DEFERRED.
U	Maximum allowed UOWs	The maximum number of units of work that can be active concurrently for this Broker kernel. See MAX-UOWS.
U	Maximum messages per UOW	The maximum number of messages allowed in a unit of work. See MAX-MESSAGES-IN-UOW.
U	UOW lifetime in seconds	Indicates the default lifetime for a unit of work. See UOW-DATA-LIFETIME.
U	Maximum message length	Indicates the maximum message size that can be sent. See MAX-UOW-MESSAGE-LENGTH.

Output Type	Display Field	Description
U	New UOW messages allowed	Indicates whether or not new units of work are allowed in this Broker kernel. See NEW-UOW-MESSAGES.
S	UOWs active	The number of units of work currently active in this Broker kernel.
S	Current UOW	The number of the last unit of work in this Broker kernel.
U	Accounting	Indicates the status of accounting records in this Broker kernel. See ACCOUNTING.
U	TCP port *	If applicable, the TCP port number on which this Broker kernel will listen for connection requests. See TCP-specific attribute PORT.
I	Number of function calls	Marks the beginning of the section of summary statistics for all the function calls.
S	DEREGISTER	The number of Broker DEREGISTER function calls since startup.
S	EOC	The number of Broker EOC function calls since startup.
S	KERNELVERS	The number of Broker KERNELVERS function calls since startup.
S	LOGOFF	The number of Broker LOGOFF function calls since startup.
S	LOGON	The number of Broker LOGON function calls since startup.
S	RECEIVE	The number of Broker RECEIVE function calls since startup.
S	REGISTER	The number of Broker REGISTER function calls since startup.
S	SEND	The number of Broker SEND function calls since startup.
S	SYNCPOINT	The number of Broker SYNCPOINT function calls since startup.
S	UNDO	The number of Broker UNDO function calls since startup.
S	REPLY_ERROR	The number of Broker REPLY_ERROR function calls since startup.
I	Worker task statistics	Marks the beginning of the section of summary statistics for all the worker tasks.
I	Worker number	The identifier of the worker task.
I	Status	The status of the worker task at shutdown.
S	# of calls	The number of Broker calls handled by the worker task since startup.
S	Idle time in seconds	The number of seconds the worker task has been idle since startup.

<sup>\*</sup> Does not apply to z/OS.

## Legend

Output Type	Description	Value	Origin of Value
I	Internal Information	Static	Determined by Software AG EntireX.
S	Shutdown Statistic	Variable	Determined by Broker activity during execution.
U	User-Specified Parameter	Variable	Specified by Broker administrator before or, if allowable, during execution.

## 12 Command Logging in EntireX

Introduction to Command Logging	15	36
ACI-driven Command Logging		
Dual Command Log Files	16	30

Command logging is a feature to assist in debugging Broker ACI applications. A command in this context represents one user request sent to the Broker and the related response of Broker.

Command logging is a feature that writes the user requests and responses to file in a way it is already known with Broker trace and TRACE-LEVEL=1. But command logging works completely independent from trace, and data is written to a file only if defined command trace filters detect a match.

Broker stub applications send commands or requests to the Broker kernel, and the Broker kernel returns a response to the requesting application. Developers who need to resolve problems in an application need access to those request and response strings inside the Broker kernel. That's where command logging comes in. With command logging, request and response strings from or to an application are written to a file that is separate from the Broker trace file.

## **Introduction to Command Logging**

This section provides an introduction to command logging in EntireX and offers examples of how command logging is implemented. It covers the following topics:

- Overview
- Command Log Files
- Defining Filters
- Programmatically Turning on Command Logging

#### Overview

Command logging is similar to a Broker trace that is generated when the Broker attribute TRACE-LEVEL is set to 1. Broker trace and command logging are independent of each other, and therefore the configuration of command logging is separate from Broker tracing.

The following Broker attributes are involved in command logging:

Attribute	Description	
CMDLOG	Set this to "N" if command logging is not needed.	
CMDLOG-FILE-SIZE	A numeric value indicating the maximum size of command log file in KI	
NUM-CMDLOG-FILTER	The maximum number of filters that can be set.	

In addition to CMDLOG=YES, the Broker needs the assignment of the dual command logging files during startup. If these assignments are missing, Broker will set CMDLOG=NO. See also *Broker Attributes*.

### **Command Log Files**

The Broker keeps a record of commands (request and response strings) in a command log file.

At Broker startup, you will need to supply two command log file names and paths. Only one file is open at a time, however, and the Broker writes commands (requests and responses) to this file.

When the size of the active command log file reaches the KB limit set by CMDLOG-FILE-SIZE, the file is closed and the second file is opened and becomes active. When the second file also reaches the KB limit set by CMDLOG-FILE-SIZE, the first file is opened and second file is closed. Existing log data in a newly opened file will be lost.

### **Defining Filters**

In command logging, a filter is used to store and identify a class, server, or service, as well as a user ID.

Use the command-line tool etbcmd to define a filter. During processing, the Broker evaluates the class, server, service, and user ID associated with each incoming request and compares them with the same parameters specified in the filters. If there is a match, the request string and response string of the request is printed out to the command log file.

### **Programmatically Turning on Command Logging**

Applications using ACI version 9 or above have access to the new field LOG-COMMAND in the ACI control block.

If this field is set, the accompanying request and the Broker's response to this request is logged to the command log file.

**Note**: Programmatic command logging ignores any filters set in the kernel.

## **ACI-driven Command Logging**

EntireX components that communicate with Broker can trigger command logging by setting the field LOG-COMMAND in the ACI control block.

When handling ACI functions with command log turned on, Broker will not evaluate any filters. Application developers must remember to reset the LOG-COMMAND field if subsequent requests are not required to be logged.

### **Dual Command Log Files**

Broker's use of two command log files prevents any one command log file from becoming too large.

At startup, Broker initializes both files and keeps one of them open. Command log statements are printed to the open file until the size of this file reaches the value specified in the Broker attribute CMDLOG-FILE-SIZE. This value must be specified in KB.

When the size of the open file exceeds the value specified in the Broker attribute CMDLOG-FILE-SIZE, Broker closes this file and opens the other, dormant file. Because the Broker closes a log file only when unable to print out a complete log line, the size of a *full* file may be smaller than CMDLOG-FILE-SIZE.

# Accounting in EntireX Broker

EntireX Accounting Data Fields	16	62
Example Uses of Accounting Data	16	65

This chapter describes the accounting records for Broker that can be used for several purposes, including:

### application chargeback

for apportioning EntireX resource consumption on the conversation and/or the application level;

### performance measurement

for analyzing application throughput (bytes, messages, etc.) to determine overall performance;

### trend analysis

for using data to determine periods of heavy and/or light resource and/or application usage.

## **EntireX Accounting Data Fields**

In the EntireX Accounting record, there are various types of data available for consumption by applications that process the accounting data:

Field Name	Accounting Version	Type of Field	Description
Record Write Time			accounting file in "YYYYMMDDHHMMSS"
EntireX Broker ID	1	A32	Broker ID from attribute file.
EntireX Version	1	A8	Version information, v.r.s.p
			where v =version
			r =release
			s =service pack
			ρ =patch level
			for example 9.6.0.00.
Platform of Operation	1	A32	Platform where EntireX is running.
EntireX Start Time	1	A14 timestamp	The time EntireX was initialized in "YYYYMMDDHHMMSS" format.
Accounting Record Type	1	A1	It is always C for conversation. Future Types will have a different value in this field.
Client User ID	1	A32	USER-ID ACI field from the client in the conversation.
Client Token	1	A32	TOKEN field from the ACI from the client.
Client Physical ID	1	A56	The physical user ID of the client, set by EntireX.
Client Communication Type 1 I1 Communication us		Communication used by client:	
			1 = Net-Work

Field Name	Accounting Version	Type of Field	Description
			2 = TCP/IP 3 = APPC 4 = IBM® MQ 5 = SSL
Client Requests Made	1	I4	Number of Requests made by client.
Client Sent Bytes	1	I4	Number of bytes sent by client.
Client Received Bytes	1	I4	Number of bytes received by client.
Client Sent Messages	1	I4	Number of messages sent by client.
Client Received Messages	1	I4	Number of messages received by client.
Client Sent UOWs	1	I4	Number of UOWs sent by client.
Client UOWs Received	1	I4	Number of UOWs received by client.
Client Completion Code	1	I4	Completion code client received when conversation ended.
Server User ID	1	A32	USER-ID ACI field from the server in the conversation.
Server Token	1	A32	TOKEN field from the ACI from the server.
Server Physical ID	1	A56	The physical user ID of the server, set by EntireX.
Server Communication Type	1	I1	Communication used by Server:
			1 = Entire Net-Work 2 = TCP/IP 3 = APPC 4 = IBM® MQ 5 = SSL
Server Requests Made	1	I4	Number of requests made by server.
Server Sent Bytes	1	I4	Number of bytes sent by server.
Server Received Bytes	1	I4	Number of bytes received by server.
Server Sent Messages	1	I4	Number of messages sent by server.
Server Received Messages	1	I4	Number of messages received by server.
Server Sent UOWs	1	I4	Number of UOWs sent by server.
Server Received UOWs	1	I4	Number of UOWs received by server.
Server Completion Code	1	I4	Completion code server received when conversation ended.
Conversation ID	1	A16	CONV-ID from ACI.
Server Class	1	A32	SERVER-CLASS from ACI.
Server Name	1	A32	SERVER-NAME from ACI.
Service Name	1	A32	SERVICE from ACI.
CID=NONE Indicator	1	A1	Will be N if CONV - ID=NONE is indicated in application.

Field Name	Accounting Version	Type of Field	Description		
Restarted Indicator	1	A1	Will be R if a conversation was restarted after a Broker shutdown.		
Conversation Start Time	1	A14 timestamp	The time the conversation began in "YYYYMMDDHHMMSS" format.		
Conversation End Time	1	A14 timestamp	The time the conversation was cleaned up in "YYYYMMDDHHMMSS" format.		
Conversation CPU Time	1	I4	Number of microseconds of CPU time used by the conversation		
Client Security Identity	2	A32	Actual identity of client derived from authenticated user ID.		
Client Application Node	2	A32	Node name of machine where client application executes.		
Client Application Type	2	A8	Stub type used by client application.		
Client Application Name	ne 2 A64 Name of the exe Corresponds to		Name of the executable that called the broker. Corresponds to the Broker Information Service field APPLICATION-NAME.		
Client Credentials Type	2	I1	Mechanism by which authentication is performed for client.		
Server Security Identity	2	A32	Actual identity of server derived from authenticated user ID.		
Server Application Node	2	A32	Node name of machine where server application executes.		
Server Application Type	2	A8	Stub type used by server application.		
Server Application Name			Name of the executable that called the broker. Corresponds to the Broker Information Service field APPLICATION-NAME.		
Server Credentials Type	2	I1	Mechanism by which authentication is performed for server.		
Client RPC Library	3	A128	RPC library referenced by client when sending the only/first request message of the conversation.		
Client RPC Program	3	A128	RPC Program referenced by client when sending the only/first request message of the conversation.		
Server RPC Library	3	A128	RPC library referenced by server when sending the only/first response message of the conversation.		
Server RPC Program	3	A128	RPC Program referenced by server when sending the only/first response message of the conversation.		
Client IPv4 Address	4	A16	IPv4 address of the client.		
Server IPv4 Address	4	A16	IPv4 address of the server.		

Field Name	Accounting Version	Type of Field	Description
Client Application Version	4	A16	Application version of the client.
Server Application Version	4	A16	Application version of the server.
Client IPv6 Address	5	A46	IPv6 address of the client.
Server IPv6 Address	5	A46	IPv6 address of the server.

**Note**: Accounting fields of any version greater than 1 are created only if the attribute AC-COUNTING-VERSION value is greater than or equal to the corresponding version. For example: accounting fields of version 2 are visible only if ACCOUNTING-VERSION=2 or higher is specified.

### **Example Uses of Accounting Data**

- Chargeback
- Trend Analysis
- Tuning for Application Performance

### Chargeback

Customers can use the EntireX accounting data to perform chargeback calculations for resource utilization in a data center. Suppose EntireX Broker is being used to dispatch messages for three business departments: Accounts Receivable, Accounts Payable, and Inventory. At the end of each month, the customer needs to determine how much of the operation and maintenance cost of EntireX Broker should be assigned to these departments. For a typical month, assume the following is true:

Department	Amount of Data	Percentage	Messages Sent	Percentage	Average Percentage
Accts Payable	50 MB	25	4000	20	22.5
Accts Receivable	40 MB	20	6000	30	25
Inventory	110 MB	55	10000	50	52.5

The use of Broker resources here is based upon both the amount of traffic sent to the Broker (bytes) as well as how often the Broker is called (messages). The average of the two percentages is used to internally bill the departments, so 52.5% of the cost of running EntireX Broker would be paid by the Inventory Department, 25% by the Accounts Receivable Department, and 22.5% by the Accounts Payable Department.

### **Trend Analysis**

The Accounting Data can also be used for trend analysis. Suppose a customer has several point-of-sale systems in several stores throughout the United States that are tied into the corporate inventory database with EntireX. The stubs would be running at the stores, and the sales data would be transmitted to the Broker, which would hand it off to the appropriate departments in inventory. If these departments wish to ascertain when the stores are busiest, they can use the accounting data to monitor store transactions. Assume all of the stores are open every day from 9 AM to 10 PM.

Local Time	Average: Weekday Transactions per Store	Maximum Weekday Transactions in any Store	Average Weekend Transactions per Store	Maximum Weekend Transactions in any Store
9 AM	7.3	27	28.2	83
10 AM	11.2	31	29.3	102
11 AM	14.6	48	37.9	113
12 noon	56.2	106	34.8	98
1 PM	25.6	65	34.2	95
2 PM	17.2	52	38.5	102
3 PM	12.1	23	42.7	99
4 PM	18.3	34	43.2	88
5 PM	26.2	47	45.2	93
6 PM	38.2	87	40.6	105
7 PM	29.6	83	39.2	110
8 PM	18.6	78	28.6	85
9 PM	11.2	55	17.5	62

The owner of the stores can examine the data and make decisions based upon the data here. For example, on weekdays, he or she can see that there is little business until lunchtime, when the number of transactions increase. It then decreases during lunch hour; then there is another increase from 5 PM to 8 PM, after people leave work. Based on this data, the owner might investigate changing the store hours on weekdays to 10 AM to 9 PM. On the weekend the trends are different, and the store hours could be adjusted as well, although there is a more regular customer flow each hour on the weekends.

### **Tuning for Application Performance**

Assume that a customer has two applications that perform basic request/response messaging for similar sized messages. The applications consist of many Windows PC clients and Natural RPC Servers on UNIX. An analysis of the accounting data shows the following:

Application Type	Class	Server		, ,	Average Client Messages Received per Conversation
Application 1:	CLASS1	SERVER1	SERVICE1	10.30	10.29
Application 2:	CLASS2	SERVER2	SERVICE2	10.30	8.98

A further analysis of the accounting data reveals that there are a lot of non-zero response codes in the records pertaining to Application 2, and that a lot of these non-zero responses indicate timeouts. With that information, the customer can address the problem by modifying the server code, or by adjusting the timeout parameters for SERVER2 so that it can have more time to get a response from the Service.
