# 1 About this Documentation

---

▪ Document Conventions .....	2
▪ Online Information and Support .....	2
▪ Data Protection .....	3

## Document Conventions

---

Convention	Description
<b>Bold</b>	Identifies elements on a screen.
Monospace font	Identifies service names and locations in the format <i>folder.subfolder.service</i> , APIs, Java classes, methods, properties.
<i>Italic</i>	Identifies:  Variables for which you must supply values specific to your own situation or environment. New terms the first time they occur in the text. References to other documentation sources.
Monospace font	Identifies:  Text you must type in. Messages displayed by the system. Program code.
{ }	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the   symbol.
[ ]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [ ] symbols.
...	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...).

## Online Information and Support

---

### Software AG Documentation Website

You can find documentation on the Software AG Documentation website at <http://documentation.softwareag.com>. The site requires credentials for Software AG's Product Support site Empower. If you do not have Empower credentials, you must use the TECHcommunity website.

### Software AG Empower Product Support Website

If you do not yet have an account for Empower, send an email to [empower@softwareag.com](mailto:empower@softwareag.com) with your name, company, and company email address and request an account.

Once you have an account, you can open Support Incidents online via the eService section of Empower at <https://empower.softwareag.com/>.

You can find product information on the Software AG Empower Product Support website at <https://empower.softwareag.com>.

To submit feature/enhancement requests, get information about product availability, and download products, go to [Products](#).

To get information about fixes and to read early warnings, technical papers, and knowledge base articles, go to the [Knowledge Center](#).

If you have any questions, you can find a local or toll-free number for your country in our Global Support Contact Directory at [https://empower.softwareag.com/public\\_directory.asp](https://empower.softwareag.com/public_directory.asp) and give us a call.

### **Software AG TECHcommunity**

You can find documentation and other technical information on the Software AG TECHcommunity website at <http://techcommunity.softwareag.com>. You can:

- Access product documentation, if you have TECHcommunity credentials. If you do not, you will need to register and specify "Documentation" as an area of interest.
- Access articles, code samples, demos, and tutorials.
- Use the online discussion forums, moderated by Software AG professionals, to ask questions, discuss best practices, and learn how other customers are using Software AG technology.
- Link to external websites that discuss open standards and web technology.

## **Data Protection**

---

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

---

# 2      Configuring webMethods EntireX to Run with the Microsoft

## Windows Personal Firewall

---

- Method 1 - Allow a Specific Executable to Open a Port ..... 6
- Method 2 - Allow a Specific Port to be used on your PC ..... 7
- Overview of Executables and Port Numbers ..... 7

If your machine is already running within a firewall-protected enterprise environment, please contact your system administrator to clarify whether this Windows firewall can be switched off to avoid having to configure it.

**Caution:** Disabling the firewall is solely your responsibility as user. Under no circumstances shall Software AG be responsible for any loss or other damages or costs which might occur due to disabling the Windows firewall.

For detailed information on configuring the Windows firewall, see the Microsoft documentation provided with your Windows version. In addition to this information, Software AG provides examples of how to run EntireX in an environment protected by the Windows firewall. However, these examples only provide technical guidelines; Software AG cannot guarantee that the examples given will provide the security you require.

These examples are based on two methods: one to allow a specific executable to open ports, the other to allow a specific port to be used by a certain program on your PC. The methods below use the EntireX Broker kernel as an example. For other EntireX components, see the list of executables and port numbers for the relevant information.

## Method 1 - Allow a Specific Executable to Open a Port

---

This method involves adding the broker kernel as an “allowed program”. This means it can open any port for TCP communication.

### ➤ To add the broker kernel as an allowed program

- Enter command:

```
C:\>netsh firewall add allowedprogram  
program="C:\SoftwareAG\EntireX\bin\etbnuc.exe" name="EntireX Broker Kernel"  
profile=ALL
```

### ➤ To remove the broker kernel as an allowed program

- Enter command:

```
C:\>netsh firewall delete allowedprogram  
program="C:\SoftwareAG\EntireX\bin\etbnuc.exe" profile=ALL
```

This example is for the EntireX Broker kernel program. To add other EntireX components as allowed programs, see [Overview of Executables and Port Numbers](#) below.

## Method 2 - Allow a Specific Port to be used on your PC

---

This method involves opening a specific port for all programs.

### ➤ To open a specific port

#### ■ Enter command:

```
C:\>netsh firewall add portopening protocol=TCP port=1971 name="EntireX Broker  
Kernel" profile=ALL
```

### ➤ To close a specific port

#### ■ Enter command:

```
C:\>netsh firewall delete portopening protocol=TCP port=1971 profile=ALL
```

This example is for the EntireX Broker kernel program. To open a port for other EntireX components, see [Overview of Executables and Port Numbers](#) below.

## Overview of Executables and Port Numbers

---

To run all of EntireX and its subprograms you will need to open a variety of communications ports, depending on the functionality you are using. Below is a list of programs that need to establish communications ports. You may choose which of the programs or ports you want to use on the PC.

It is important to note that the file locations and the port numbers listed are the default settings. These parameters may be customized during the installation process. If you did not install using the default settings, you will need to use your custom parameters.

See [Method 1 - Allow a Specific Executable to Open a Port](#) and [Method 2 - Allow a Specific Port to be used on your PC](#) for the syntax required.

Component	Method 1			Method 2	Notes
	Program Name	Executable	File Location	Default Port Numbers	
EntireX Broker Kernel	EntireX Broker Kernel	etbnuc.exe	C:\SoftwareAG\EntireX\bin\	TCP port: 1971 SSL port: 1958	
EntireX Broker Administration Service	EntireX Broker Administration Service	etbnuc.exe	C:\SoftwareAG\EntireX\bin\	TCP port: 57707 SSL port: 57808	
EntireX Broker Agent	Broker Agent (com. softwareag. entirex.ba. Broker Agent)	java.exe	%JAVA_HOME%\bin\java.exe (see note *)	TCP port: 3000	Method 1 requires that you allow <i>java.exe</i> and/or <i>javaw.exe</i> , which will allow all Java-based programs to open ports. If you do not want to allow this, use method 2 and specify just the port number.
SSL Broker Agent	SSL Broker Agent (com. softwareag. entirex.ba. SSL Broker Agent)	java.exe	%JAVA_HOME%\bin\java.exe	TCP port: 1958	
Software AG Web Server	Software AG Web Server	java.exe	%JAVA_HOME%\bin\java.exe	HTTP: 10010 (Base port)	

(\*) Optional, because this port is used only for outgoing packages.

# 3

## Setting up Broker Instances

---

- Starting and Stopping the Default Broker ..... 10
- Running Broker with SSL/TLS Transport ..... 10
- Uniqueness Test for Broker ID ..... 11
- Tracing EntireX Broker ..... 11
- Protecting a Broker against Denial-of-Service Attacks ..... 13

## Starting and Stopping the Default Broker

---

If check box **Turn on Autostart for default EntireX Broker** is checked during installation, the default broker ETB001 is started.

### ➤ To start the default broker

- From the Windows start menu, choose **Software AG > Start Servers > Start EntireX Default Broker**.

### ➤ To stop the default broker

- From the Windows start menu, choose **Software AG > Stop Servers > Stop EntireX Default Broker**.

## Running Broker with SSL/TLS Transport

---

The Broker can use Secure Sockets Layer/Transport Layer Security (SSL/TLS) as the transport medium. The term “SSL” in this section refers to both SSL and TLS. RPC-based clients and servers as well as ACI clients and servers are always SSL clients. The broker is always the SSL server. For an introduction see *SSL/TLS and Certificates with EntireX* in the EntireX Security documentation.

Before starting the Broker, it must be configured to correctly use SSL as a transport mechanism:

### ➤ To set up SSL

- 1 To operate with SSL, certificates need to be provided and maintained. Depending on the platform, Software AG provides default certificates, but we strongly recommend that you create your own. See *SSL/TLS Sample Certificates Delivered with EntireX* in the EntireX Security documentation.
- 2 Modify broker-specific attributes.

Append "-SSL" to the `TRANSPORT` attribute. For example:

```
DEFAULTS = BROKER
TRANSPORT = TCP-SSL
```

See also `TRANSPORT`.

- 3 Set the SSL attributes, for example:

```
DEFAULTS = SSL
KEY-STORE = "C:\SoftwareAG\EntireX\etc\ExxAppCert.pem"
KEY-PASSWD-ENCRYPTED = MyAppKey
KEY-FILE = "C:\SoftwareAG\EntireX\etc\ExxAppKey.pem"
VERIFY-CLIENT = N
PORT=1958
```

where `1958` is the default but can be changed to any port number.

See also *SSL/TLS-specific Attributes* and *SSL/TLS and Certificates with EntireX*.

- 4 Make sure the SSL clients connecting to the broker are prepared for SSL connections as well. See *Using SSL/TLS with EntireX Components*.

## Uniqueness Test for Broker ID

---

To guarantee that a broker ID is unique on one machine, a named semaphore is created at initialization. If this semaphore already exists for this broker ID, initialization is terminated with message ETBE0168, "This instance of broker already running". If as a result of an abnormal broker termination this semaphore cannot be deleted completely, you can force a restart of the Broker with Broker attribute `FORCE=YES`.

## Tracing EntireX Broker

---

This section covers the following topics:

- [Broker TRACE-LEVEL Attribute](#)
- [Attribute File Trace Setting](#)
- [Deferred Tracing](#)

- [Trace File Handling](#)

### Broker TRACE-LEVEL Attribute

The Broker TRACE-LEVEL attribute determines the level of tracing to be performed while Broker is running. The Broker has a master TRACE-LEVEL specified in the Broker section of the attribute file as well as several individual TRACE-LEVEL settings that are specified in the following sections of the attribute file. You can also modify the different TRACE-LEVEL values while Broker is running, without having to restart the Broker kernel for the change to take effect.

For temporary changes to TRACE-LEVEL without restarting the Broker, use Command Central (master trace only) or the Broker command-line utility [etbcmd](#).

Individual Settings	Specified in Attribute File Section
Master trace level	DEFAULTS=BROKER
Persistent store trace level	DEFAULTS=ADABAS   CTREE   DIV
Conversion trace level	DEFAULTS=SERVICE; Trace option of the service-specific broker attribute CONVERSION.
Security trace level	DEFAULTS=SECURITY
Transport trace level	DEFAULTS=TCP   SSL
Application Monitoring trace level	DEFAULTS=APPLICATION-MONITORING

These individual TRACE-LEVEL values determine the level of tracing within each subcomponent. If not specified, the master TRACE-LEVEL is used.

### Attribute File Trace Setting

Trace Level	Description
0	No tracing. Default value.
1	Traces incoming requests, outgoing replies, and resource usage.
2	All of Trace Level 1, plus all main routines executed.
3	All of Trace Level 2, plus all routines executed.
4	All of Trace Level 3, plus Broker ACI control block displays.

**Note:** Trace levels 2 and above should be used only when requested by Software AG support.

## Deferred Tracing

It is not always convenient to run with `TRACE-LEVEL` defined, especially when higher trace levels are involved. Deferred tracing is triggered when a specific condition occurs, such as an ACI response code or a broker subtask abend. Such conditions cause the contents of the trace buffer to be written, showing trace information leading up to the specified event. If the specified event does not occur, the Broker trace will contain only startup and shutdown information (equivalent to `TRACE-LEVEL=0`). Operating the trace in this mode requires the following additional attributes in the broker section of the attribute file. Values for `TRBUFNUM` and `TRAP-ERROR` are only examples.

Attribute	Value	Description
<code>TRBUFNUM</code>	3	Specifies the deferred trace buffer size = 3 * 64 K.
<code>TRMODE</code>	<code>WRAP</code>	Indicates trace is not written until an event occurs.
<code>TRAP-ERROR</code>	322	Assigns the event ACI response code 00780322 "PSI: UPDATE failed".

## Trace File Handling

Attributes `MAX-TRACE-FILES` and `TRACE-FILE-SIZE` are used to avoid a constantly growing `ETB.LOG` file. The trace is written to file `ETB.LOG` until `TRACE-FILE-SIZE` has been reached and a new file is opened. The number of files defined in `MAX-TRACE-FILES` is kept in addition to the current `ETB.LOG` file.

Example: If you define `MAX-TRACE-FILES=9` and `TRACE-FILE-SIZE=100M`, the current `ETB.LOG` will be closed after 100 MB have been written. A maximum of nine backup files plus the current `ETB.LOG` file are kept.

## Protecting a Broker against Denial-of-Service Attacks

An optional feature of EntireX Broker is available to protect a broker running with `SECURITY=YES` against denial-of-service attacks. An application that is running with invalid user credentials will get a security response code. However, if the process is doing this in a processing loop, the whole system could be affected. If `PARTICIPANT-BLACKLIST` is set to `YES`, EntireX Broker maintains a blacklist to handle such "attacks". If an application causes ten consecutive security class error codes within 30 seconds, the blacklist handler puts the participant on the blacklist. All subsequent requests from this participant are blocked until the `BLACKLIST-PENALTY-TIME` has elapsed.

### Server Shutdown Use Case

Here is a scenario illustrating another use of this feature that is not security-related.

An RPC server is to be shut down immediately, using Broker Command and Information Services (CIS), and has no active request in the broker. The shutdown results in the `LOGOFF` of the server. The next request that the server receives will probably result in message 00020002 "User does not

exist", which will cause the server to reinitialize itself. It was not possible to inform the server that shutdown was meant to be performed.

With the *blacklist*, this is now possible. As long as the blacklist is not switched off, when a server is shut down immediately using CIS and when there is no active request in the broker, a marker is set in the blacklist. When the next request is received, this marker results in message 00100050 "Shutdown IMMED required", which means that the server is always informed of the shutdown.

## 4 Configuring the Administration Service

---

The Administration Service controls the processes of the local brokers. The brokers are started or stopped. The local brokers connect with the Administration Service and provide it with their status and other information at an interval of 60 seconds. The Administration Service always has information on the current status of all local brokers.

The Administration Service also collates the status and other information of any known remote brokers and provides an interface with which these can be accessed.

The Administration Service is provided in a fully functional state and is started by the installation. It needs access to the local port 57707, and to port 57808 for remote connections. The connections to port 57808 are SSL only. If this port is to be used, the client requires the respective SSL certificate.

The ports of the Administration Service and of the default Broker ETB001 can be changed in the configuration file *config/entirex.config*.

```
entirex.default.broker.tcp.port=20071
entirex.default.broker.ssl.port=20051
entirex.etbadm.tcp.port=20007
entirex.etbadm.ssl.port=20008
```

It is not normally necessary to change the configuration of the Administration Service. The log files and SSL certificates are delivered in the EntireX directory *config/etb/ETBADM*. If an error occurs, the log files of the Administration Service can provide information on the cause of the error. The log files are called *ETBADM.LOG* and *ETBSRV.LOG*.

The Administration Service requires SSL certificates to create brokers with SSL ports. During installation, the Administration Service copies the SSL certificates from the EntireX *etc* directory to the EntireX *config/etb* directory if this directory does not already contain any certificates. These certificates are for test purposes only and constitute a security risk. If you want to use SSL, replace the certificates in the *config/etb* directory with your own SSL certificates.

When a broker is created, the Administration Service copies the required certificates from the EntireX *config/etb* directory to the working directory of the newly created broker.

If the certificates are to be replaced after the installation, you also need to replace the certificates in the working directories *ETBADM* (Administration Service) and *ETB001* (Default Broker) in the EntireX directory *config/etb*.

# 5 Broker Attributes

---

▪ Name and Location of Attribute File .....	19
▪ Attribute Syntax .....	19
▪ Broker-specific Attributes .....	21
▪ Service-specific Attributes .....	44
▪ Codepage-specific Attributes .....	57
▪ Security-specific Attributes .....	60
▪ TCP/IP-specific Attributes .....	67
▪ c-tree-specific Attributes .....	70
▪ SSL/TLS-specific Attributes .....	72
▪ DIV-specific Attributes .....	77
▪ Adabas-specific Attributes .....	78
▪ Application Monitoring-specific Attributes .....	80
▪ Authorization Rule-specific Attributes .....	81
▪ Variable Definition File .....	82

**Note:** This section lists all EntireX Broker parameters. Not all parameters are applicable to all supported operating systems.

The Broker attribute file contains a series of parameters (attributes) that control the availability and characteristics of clients and servers, as well as of the Broker itself. You can customize the Broker environment by modifying the attribute settings.

## Name and Location of Attribute File

The name and location of the broker attribute file is platform-dependent.

Platform	File Name/Location
Windows	File <i>&lt;BrokerName&gt;.atr</i> in directory <i>&lt;InstDir&gt;\EntireX\config\etb\&lt;BrokerName&gt;</i> (default) *

\* When starting a broker manually, name and location of the broker attribute file can be overwritten with the environment variable `ETB_ATTR`.

## Attribute Syntax

Each entry in the attribute file has the format:

```
ATTRIBUTE-NAME=value
```

The following rules and restrictions apply:

- A line can contain multiple entries separated by commas.
- Attribute names can be entered in mixed upper and lowercase.
- Spaces between attribute names, values and separators are ignored.
- Spaces in the attribute names are not allowed.
- Commas and equal signs are not allowed in value notations.
- Lines starting with an asterisk (\*) are treated as comment lines. Within a line, characters following an \* or # sign are also treated as comments.
- The `CLASS` keyword must be the first keyword in a service definition.
- Multiple services can be included in a single service definition section. The attribute settings will apply to all services defined in the section.
- Attributes specified after the service definition (`CLASS`, `SERVER`, `SERVICE` keywords) overwrite the default characteristics for the service.
- Attribute values can contain variables of the form `${variable name}` or `$variable name`:
  - Due to variations in EBCDIC codepages, braces should only be used on ASCII (UNIX or Windows) platforms or EBCDIC platforms using the IBM-1047 (US) codepage.
  - The variable name can contain only alphanumeric characters and the underscore (\_) character.

- The first non-alphanumeric or underscore character terminates the variable name.
- Under UNIX and Windows, the string `${variable name}` is replaced with the value of the corresponding environment variable.
- On z/OS, variable values are read from a file defined by the DD name `ETBVAR`. The syntax of this file is the same as the attribute file.
- If a variable has no value: if the variable name is enclosed in braces, error 00210594 is given, otherwise `$variable name` will be used as the variable value.
- If you encounter problems with braces (and this is quite possible in a z/OS environment), we suggest you omit the braces.

## Broker-specific Attributes

The broker-specific attribute section begins with the keyword `DEFAULTS=BROKER`. It contains attributes that apply to the broker. At startup time, the attributes are read and duplicate or missing values are treated as errors. When an error occurs, the broker stops execution until the problem is corrected.

**Tip:** To avoid resource shortages for your applications, be sure to specify sufficiently large values for the broker attributes that define the global resources.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
ABEND-LOOP-DETECTION	<u>YES</u>   NO	O	z	u	w	v	b
	<p><b>YES</b> Stop broker if a task terminates abnormally twice, that is, the same abend reason at the same abend location already occurred. This attribute prevents an infinite abend loop.</p> <p><b>NO</b> Use only if requested by Software AG Support. This setting may make sense if a known error leads to an abnormal termination, but a hotfix solving the problem has not yet been provided. Reset to "YES" when the hotfix has been installed.</p>						
ABEND-MEMORY-DUMP	<u>YES</u>   NO	O	z	u	w	v	b
	<p><b>YES</b> Print all data pools of the broker if a task terminates abnormally. This dump is needed to analyze the abend.</p> <p><b>NO</b> If the dump has already been sent to Software AG, you can set to "NO" to avoid the extra overhead.</p>						
ACCOUNTING	<u>NO</u>   128-255	O	z				
	<u>NO</u>   YES [SEPARATOR= <i>char</i> ]	O		u	w	v	b
	<p>Determines whether accounting records are created.</p> <p><b>NO</b> Do not create accounting records.</p> <p><i>nnn</i> The SMF record number to use when writing the accounting records.</p> <p><b>YES</b> Create accounting data.</p> <p><i>char</i>= separator character(s). Up to seven separator characters can be specified using the <code>SEPARATOR</code> suboption, for example</p>						

Attribute	Values	Opt/ Req	Operating System				
			S/OS	UNIX	Windows	z/SE	BS2000
	<p>ACCOUNTING = (YES, SEPARATOR=;). If no separator character is specified, the comma character will be used.</p> <p>See also <i>Accounting in EntireX Broker</i> in the platform-specific Administration documentation.</p>						
ACCOUNTING-VERSION	<u>1</u>   2   3   4   5	O	z	u	w	v	b
	<p>Determines whether accounting records are created.</p> <p>1 Collect accounting information. This value is supported for reasons of compatibility with EntireX Broker 7.2.1 and below.</p> <p>2 Collect extended accounting information in addition to that available with option 1.</p> <p>3 Create accounting records in layout of version 3.</p> <p>4 Create accounting records in layout of version 4.</p> <p>5 Create accounting records in layout of version 5.</p> <p>This parameter applies when ACCOUNTING is activated.</p>						
APPLICATION-MONITORING or APPMON	YES   <u>NO</u>	O	z	u	w	v	
	<p>Enable application monitoring in EntireX Broker.</p> <p>YES Enable application monitoring.</p> <p>NO Disable application monitoring.</p> <p>See <i>Application Monitoring</i>.</p>						
AUTOLOGON	<u>YES</u>   NO	O	z	u	w	v	b
	<p>YES LOGON occurs automatically during the first SEND or REGISTER.</p> <p>NO The application has to issue a LOGON call.</p>						
BLACKLIST-PENALTY-TIME	<u>5m</u>   n   nS   nM   nH	R	z	u	w	v	b
	<p>Define the length of time a participant is placed on the PARTICIPANT-BLACKLIST to prevent a denial-of-service attack.</p> <p>n Same as nS.</p> <p>nS Non-activity time in seconds (max. 2147483647).</p> <p>nM Non-activity time in minutes (max. 35791394).</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p><i>n</i> H Non-activity time in hours (max. 596523).</p> <p>See <i>Protecting a Broker against Denial-of-Service Attacks</i> in the platform-specific broker Administration documentation.</p>						
BROKER-ID	A32	R	z	u	w	v	b
	<p>Identifies the broker to which the attribute file applies. The broker ID must be unique per machine.</p> <p><b>Note:</b> The numerical section of the BROKER-ID is no longer used to determine the DBID in the EntireX Broker kernel with Entire Net-Work transport (NET). To determine the DBID, use attribute NODE in the DEFAULTS=NET section of the attribute file.</p>						
CLIENT-NONACT	<u>15M</u>   <i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	R	z	u	w	v	b
	<p>Define the non-activity time for clients.</p> <p><i>n</i> Same as <i>nS</i>.</p> <p><i>nS</i> Non-activity time in seconds (max. 2147483647).</p> <p><i>nM</i> Non-activity time in minutes (max. 35791394).</p> <p><i>nH</i> Non-activity time in hours (max. 596523).</p> <p>A client that does not issue a broker request within the specified time limit is treated as inactive and all resources for the client are freed.</p>						
CMDLOG	<u>NO</u>   YES	O	z	u	w	v	b
	<p>NO Command logging will not be available in the broker.</p> <p>YES Command logging features will be available in the broker.</p>						
CMDLOG-FILE-SIZE	<u>1024</u>   <i>n</i>	O	z	u	w	v	b
	<p>Defines the maximum size of the file that the command log is written to, in kilobytes. The value must be 1024 or higher. The default value is 1024. When one command log file grows to this size, broker starts writing to the other file. For more details, see <i>Command Logging in EntireX</i>.</p>						
CONTROL-INTERVAL	<u>60s</u>   <i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	O	z	u	w	v	b
	<p>Defines the time interval of time-driven broker-to-broker calls.</p> <p>1. It controls the time between handshake attempts.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>2. The standby broker will check the status of the standard broker after the elapsed CONTROL - INTERVAL time.</p> <p><i>n</i> Same as <i>nS</i>.  <i>nS</i> Interval in seconds (max. 2147483647).  <i>nM</i> Interval in minutes (max. 35791394).  <i>nH</i> Interval in hours (max. 596523).                      The minimum value is 16 seconds. We strongly recommend the default value (60 seconds), except for very slow machines.</p>						
CONV - DEFAULT	<u>UNLIM</u>   <i>n</i>	O	z	u	w	v	b
	<p>Default number of conversations that are allocated for every service.</p> <p><u>UNLIM</u> The number of conversations is restricted only by the number of conversations globally available. Precludes the use of NUM - CONVERSATION.</p> <p><i>n</i> Number of conversations.</p> <p>This value can be overridden by specifying a CONV - LIMIT for the service. A value of 0 (zero) is invalid.</p>						
DEFERRED	<u>NO</u>   YES	O	z	u	w	v	b
	<p>Disable or enable deferred processing of units of work.</p> <p><u>NO</u> Units of work cannot be sent to the service until it is available.                      YES Units of work can be sent to a service that is not up and registered. They will be processed when the service becomes available.</p>						
DYNAMIC - MEMORY - MANAGEMENT	<u>YES</u>   NO	O	z	u	w	v	b
	<p><u>YES</u> An initial portion of memory is allocated at broker startup based on defined NUM - * attributes or internal default values if no NUM - * attributes have been defined. More memory is allocated without broker restart if there is a need to use more storage. Unused memory is deallocated. The upper limit of memory consumption can be defined by the attribute MAX - MEMORY. See <i>Dynamic Memory Management</i> under <i>Broker Resource Allocation</i>.</p> <p><u>NO</u> All memory is allocated at broker startup based on the calculation from the defined NUM - * attributes. Size of memory cannot be changed. This was the known behavior of EntireX 7.3 and earlier.</p>						

Attribute	Values	Opt/ Req	Operating System							
			z/OS	UNIX	Windows	z/SE	BS2000			
	<p>If you run your broker with attribute DYNAMIC-MEMORY-MANAGEMENT=YES, the following attributes are not needed:</p> <ul style="list-style-type: none"> <li>■ CONV-DEFAULT</li> <li>■ HEAP-SIZE</li> <li>■ LONG-BUFFER-DEFAULT</li> <li>■ SERVER-DEFAULT</li> <li>■ SHORT-BUFFER-DEFAULT</li> <li>■ NUM-CLIENT</li> <li>■ NUM-CMDLOG-FILTER</li> <li>■ NUM-COMBUF</li> <li>■ NUM-CONV[ERSATION]</li> <li>■ NUM-LONG[-BUFFER]</li> <li>■ NUM-SERVER</li> <li>■ NUM-SERVICE-EXTENSION</li> <li>■ NUM-SERVICE</li> <li>■ NUM-SHORT[-BUFFER]</li> <li>■ NUM-UOW MAX-UOWS MUOW</li> <li>■ NUM-WQE</li> </ul> <p><b>Caution:</b> However, if one of these attributes is defined, it determines the allocation size of that particular broker resource.</p>									
DYNAMIC-WORKER-MANAGEMENT	NO   YES	O	z	u	w		b			
	<p>NO All worker tasks are started at broker startup. The number of worker tasks is defined by NUM-WORKER. After this initial step, no further worker tasks can be started. This is default and simulates the behavior of EntireX version 8.0 and earlier.</p> <p>YES As above, the initial portion of worker tasks started at broker startup is determined by NUM-WORKER. However, if there is a need to handle an increased workload, additional worker tasks can be started at runtime without restarting broker. Conversely, if a worker task remains unused, it is stopped. The upper and lower limit of running worker tasks can be defined by the attributes WORKER-MIN and WORKER-MAX.</p> <p>If you run broker with DYNAMIC-WORKER-MANAGEMENT=YES, the following attributes are useful to optimize the overall processing:</p> <ul style="list-style-type: none"> <li>■ WORKER-MAX</li> <li>■ WORKER-MIN</li> <li>■ WORKER-NONACT</li> <li>■ WORKER-QUEUE-DEPTH</li> </ul>									

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
	<p>■ WORKER-START-DELAY</p> <p>The attribute NUM-WORKER defines the initial number of worker tasks started during initialization. See <i>Dynamic Worker Management</i> under <i>Broker Resource Allocation</i>.</p>						
FORCE	<u>NO</u>   YES	O		u			
	<p>NO Go down with error if IPC resources still exist. YES Clean up the left-over IPC resources of a previous run.</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. If broker is started twice, the second instance will kill the first by removing the IPC resources.</li> <li>2. For BS2000, z/OS and z/VSE, see separate attribute FORCE under DEFAULTS=NET.</li> </ol>						
HEAP-SIZE	<u>1024</u>   n	O	z	u	w	v	b
	<p>Defines the size of the internal heap in KB. Not required if you are using DYNAMIC-MEMORY-MANAGEMENT. If you are <i>not</i> using dynamic memory management, we strongly recommend specifying - as a minimum - the default value of 1024 KB.</p>						
ICU-CONVERSION	<u>YES</u>   NO	O	z	u	w	v	b
	<p>Disable or enable ICU conversion. Default for z/VSE is NO; other platforms YES.</p> <p>YES ICU is loaded and available for conversion. It is a prerequisite for CONVERSION=SAGTCHA and CONVERSION=SAGTRPC.</p> <p>NO ICU is not loaded and not available for conversion. CONVERSION=SAGTCHA and CONVERSION=SAGTRPC cannot be used.</p> <p>If any of the broker service definitions uses the character conversion approach <i>ICU Conversion</i>, that is, CONVERSION=SAGTCHA or CONVERSION=SAGTRPC, ICU-CONVERSION must be set to YES. If you are using only a user exit (see <i>User Exits</i>) or CONVERSION=NO as character conversion approach for all your broker service definitions, ICU-CONVERSION can be set to "NO".</p> <p>ICU requires additional storage to run properly. If ICU conversion is not needed, setting ICU-CONVERSION to NO will help to avoid unnecessary storage consumption.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
ICU-DATA-DIRECTORY	Folder or directory name in quotes.	O	z	u	w		
The location where the broker searches for ICU custom converters. See <i>Building and Installing ICU Custom Converters</i> in the platform-specific Administration documentation.							
ICU-SET-DATA-DIRECTORY	<u>YES</u>   NO	O	z	u	w		
Disable or enable ICU custom converter usage.							
YES The broker tries to locate ICU custom converters with the mechanism defined by the platform, see <i>Building and Installing ICU Custom Converters</i> in the platform-specific Administration documentation.							
NO Use of ICU custom converters is not possible.							
IPV6	<u>YES</u>   <u>NO</u>	O	z	u	w		b
YES Establish SSL and TCP/IP transport in IPv6 and IPv4 networks according to the TCP/IP stack configuration.							
NO Establish SSL and TCP/IP transport in IPv4 network only.							
This attribute applies to EntireX version 9.0 and above.							
LONG-BUFFER-DEFAULT	<u>UNLIM</u>   <i>n</i>	O	z	u	w	v	b
Number of long buffers to be allocated for each service.							
UNLIM The number of long message buffers is restricted only by the number of buffers globally available. Precludes the use of NUM-LONG-BUFFER.							
<i>n</i> Number of buffers.							
This value can be overridden by specifying a LONG-BUFFER-LIMIT for the service. A value of 0 (zero) is invalid.							
MAX-MEMORY	<u>0</u>   <i>n</i>   <i>nK</i>   <i>nM</i>   <i>nG</i>   UNLIM	O	z	u	w	v	b
Defines the upper limit of memory allocated by broker if DYNAMIC-MEMORY-MANAGEMENT=YES has been defined.							
0, UNLIM No memory limit.							
others Defines the maximum limit of allocated memory. If limit is exceeded, error 671 "Requested allocation exceeds MAX-MEMORY" is generated.							

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
MAX-MESSAGE-LENGTH	<u>2147483647</u>   <i>n</i>	O	z	u	w	v	b
	Maximum message size that the broker kernel can process. This value is transport-dependent. The default value represents the highest positive number that can be stored in a four-byte integer.						
MAX-MESSAGES-IN-UOW	<u>16</u>   <i>n</i>	O	z	u	w	v	b
	Maximum number of messages in a UOW.						
MAX-MSG	See MAX-MESSAGE-LENGTH.						
MAX-TRACE-FILES	<u>4</u>   <i>n</i>	O		u	w		
	Defines the number of backup copies of the trace file ETB.LOG. Minimum number is 1; maximum is 999. A new trace file is allocated when the value for TRACE-FILE-SIZE is exceeded. These two attributes prevent a constantly growing ETB.LOG file. See <i>Trace File Handling</i> in the UNIX and Windows Administration documentation.						
MAX-UOW-MESSAGE-LENGTH	See MAX-MESSAGE-LENGTH.						
MAX-UOWS	<u>0</u>   <i>n</i>	O	z	u	w	v	b
	The maximum number of UOWs that can be concurrently active broker-wide. The default value is 0 (zero), which means that the broker will process only messages that are not part of a unit of work. If UOW processing is to be done by any service, a MAX-UOWS value must be 1 or larger for the broker.						
	The MAX-UOWS value for the service will default to the value set for the broker. NUM-UOW is an alias of this parameter.						
MESSAGE-CASE	<u>NONE</u>   UPPER   LOWER	O	z	u	w	v	b
	Indicates if certain error message texts returned by the broker to its clients or written by the broker to its log file are to be in mixed case, uppercase, or lowercase.						
	NONE No changes are made to message case.						
	UPPER Messages are changed to uppercase.						
	LOWER Messages are changed to lowercase.						
MUOW	See NUM-UOW.						
NEW-UOW-MESSAGES	<u>YES</u>   NO	O	z	u	w	v	b
	YES New UOW messages are allowed.						
	NO New UOW messages are not allowed.						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>This applies to UOW when using Persistence and should not be used for non-persistent UOWs. A usage example could be the following:</p> <p>The broker persistent store reaches capacity and the broker shuts down. You can set NEW-UOW-MESSAGES to "NO" to prevent new UOW messages from being added after a broker restart. This action allows only consumption (not production) of UOWs to occur after broker restart. After the persistent store capacity has been sufficiently reduced, the EntireX Broker administrator can issue a CIS command, see ALLOW-NEUOWMSGs. This action allows new UOW messages to be sent to the broker. Reset attribute NEW-UOW-MESSAGES to "YES", which permits new UOW messages to be produced in subsequent broker sessions.</p>						
NUM-BLACKLIST-ENTRIES	<u>256</u>   <i>n</i>	O	z	u	w	v	b
	<p>Number of entries in the participant blacklist. Default value is 256 entries. Together with BLACKLIST-PENALTY-TIME and PARTICIPANT-BLACKLIST, this attribute is used to protect a broker running with SECURITY=YES against denial-of-service attacks. See <i>Protecting a Broker against Denial-of-Service Attacks</i> in the platform-specific broker Administration documentation.</p>						
NUM-CLIENT	<i>n</i>	R	z	u	w	v	b
	<p>Number of clients that can access the broker concurrently. A value of 0 (zero) is invalid.</p>						
NUM-CMDLOG-FILTER	<u>1</u>   <i>n</i>	O	z	u	w	v	b
	<p>Maximum number of filters that can be specified simultaneously.</p> <p><b>Tip:</b> We recommend you limit this value to the number of services that are being monitored. Minimum value is 1. A value of zero is invalid when the attribute CMDLOG is set to "YES". See <i>Command Logging in EntireX</i> for more information.</p>						
NUM-COMBUF	<u>1024</u>   1 - 999999	R	z	u	w	v	b
	<p>Determines the maximum number of communication buffers available for processing commands arriving in the broker kernel. The size of one communication buffer is usually 16 KB split into 32 slots of 512 bytes, but it ultimately depends on the hardware architecture of your CPU. A value of 0 (zero) is invalid.</p>						
NUM-CONVERSATION or NUM-CONV	<i>n</i>   AUTO	R	z	u	w	v	b
	<p>Defines the number of conversations that can be active concurrently. The number specified should be high enough to account for both conversational and non-conversational requests. (Non-conversational requests are treated internally as one-conversation requests.)</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p><i>n</i> Number of conversations.</p> <p>AUTO Uses the CONV-DEFAULT and the service-specific CONV-LIMIT values to calculate the number of conversations. The values used in the calculation must not be set to "UNLIM".</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. A value of 0 (zero) is invalid. If a wildcard service is defined in the service-specific section of the attribute file, the value of AUTO is invalid.</li> <li>2. See <i>Wildcard Service Definitions</i> under <i>Broker Attributes</i>.</li> </ol>						
NUM-LONG-BUFFER or NUM-LONG	<p>4096   <i>n</i>   AUTO</p> <p>Defines the number of long message containers. Long message containers have a fixed length of 4096 bytes and are used to store requests that are larger than 2048 bytes. Storing a request of 8192 bytes, for example, would require two long message containers.</p> <p><i>n</i> Number of buffers.</p> <p>AUTO Uses the LONG-BUFFER-DEFAULT and the service-specific LONG-BUFFER-LIMIT values to calculate the number of long message buffers. The values used in the calculation must not be set to "UNLIM".</p> <p>A value of 0 (zero) is invalid.</p> <p>In <i>non-conversational</i> mode, message containers are released as soon as the client receives a reply from the server. If no reply is requested, message containers are released as soon as the server receives the client request.</p> <p>In <i>conversational</i> mode, the last message received is always kept until a new one is received.</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. If a catch-all service is defined in the service-specific section of the attribute file, the value of AUTO is invalid.</li> <li>2. See <i>Wildcard Service Definitions</i> under <i>Broker Attributes</i>.</li> </ol>	R	z	u	w	v	b
NUM-PARTICIPANT-EXTENSION	<i>n</i>	O	z	u	w	v	b

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
	<p>Defines the number of participant extensions to link participants as clients and servers.</p> <p><i>n</i>                      Number of participant extensions</p> <p><i>not specified</i> If this attribute is not set, the default value is calculated based on NUM-CLIENT and NUM-SERVER.</p> <p>A value of 0 (zero) is invalid.</p>						
NUM-SERVER	<i>n</i>   AUTO	R	z	u	w	v	b
	<p>Defines the number of servers that can offer services concurrently using the broker. This is <i>not</i> the number of services that can be registered to the broker (see NUM-SERVICE).</p> <p><i>n</i>                      Number of servers.</p> <p>AUTO Uses the SERVER-DEFAULT and the service-specific SERVER-LIMIT values to calculate the number of servers. The values used in the calculation must not be set to "UNLIM".</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>Setting this value higher than the number of services allows the starting of server replicas that provide the same service.</li> <li>A value of 0 (zero) is invalid. If a wildcard service is defined in the service-specific section of the attribute file, the value of AUTO is invalid.</li> <li>See <i>Wildcard Service Definitions</i> under <i>Broker Attributes</i>.</li> </ol>						
NUM-SERVICE	<i>n</i>	R	z	u	w	v	b
	<p>Defines the number of services that can be registered to the broker. This is <i>not</i> the number of servers that can offer the services (see NUM-SERVER). A value of 0 (zero) is invalid.</p>						
NUM-SERVICE-EXTENSION	<i>n</i>   AUTO	O	z	u	w	v	b
	<p>Defines the number of service extensions to link servers to services.</p> <p><i>n</i>                      Number of service extensions.</p> <p>AUTO                  Uses the value specified or calculated for NUM-SERVER + NUM-CLIENT, plus an extra cushion.</p> <p><i>not specified</i> If this attribute is not set, the default value is NUM-SERVER multiplied by NUM-SERVICE.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>The minimum value is NUM-SERVER.                      The maximum value is NUM-SERVER multiplied by NUM-SERVICE.</p> <p>Caution is recommended with this attribute:</p> <ul style="list-style-type: none"> <li>■ Set this attribute only if the storage resources allocated for service extensions need to be restricted.</li> <li>■ Note that the value &lt;n&gt; allows only the specified number of server instances of &lt;n&gt; to be used.</li> <li>■ Value AUTO will calculate the number of allowed server instances from NUM-SERVER, which itself might be set to AUTO. In this case, this also considers the value of SERVER-DEFAULT and even the individual SERVER-LIMIT for each service definition (see note below).</li> </ul>						
NUM-SHORT-BUFFER or NUM-SHORT	n   AUTO	R	z	u	w	v	b
	<p>Defines the number of short message containers. Short message containers have a fixed length of 256 bytes and are used to store requests of no more than 2048 bytes. To store a request of 1024 bytes, for example, would require four short message containers.</p> <p><i>n</i>      Number of buffers.</p> <p>AUTO Uses the SHORT-BUFFER-DEFAULT and the service-specific SHORT-BUFFER-LIMIT values to calculate the number of short message buffers. The values used in the calculation must not be set to "UNLIM".</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>1. In <i>non-conversational</i> mode, message containers are released as soon as the client receives a reply from the server. If no reply is requested, message containers are released as soon as the server receives the client request.</li> <li>2. In <i>conversational</i> mode, the last message received is always kept until a new one is received.</li> <li>3. If a wildcard service is defined in the service-specific section of the attribute file, the value of AUTO is invalid.</li> <li>4. See <i>Wildcard Service Definitions</i> under <i>Broker Attributes</i>.</li> </ol>						
NUM-UOW	0   n	O	z	u	w	v	b
	<p>The maximum number of UOWs that can be concurrently active broker-wide.                      The default value is 0 (zero), which means that the broker will process only</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>messages that are not part of a unit of work. If UOW processing is to be done by any service, a NUM-UOW value must be 1 or larger for the broker. (MAX-UOWS is an alias for this attribute.)</p> <p>The NUM-UOW value for the service will default to the value set for the broker.</p>						
NUM-WORKER	<u>1</u>   n (max. 10)	R	z	u	w	v	b
	<p>Number of worker tasks that the broker can use. The number of worker tasks determines the number of functions (SEND, RECEIVE, REGISTER, etc.) that can be processed concurrently. At least one worker task is required; this is the default value.</p>						
NUM-WQE	1 - 32768	R	z	u	w	v	b
	<p>Maximum number of requests that can be processed by the broker in parallel, over all transport mechanisms.</p> <p>Each broker command is assigned a worker queue element, regardless of the transport mechanism being used. This element is released when the user has received the results of the command, including the case where the command has timed out.</p>						
PARTICIPANT-BLACKLIST	<u>YES</u>   NO	R	z	u	w	v	b
	<p>Determines whether participants attempting a denial-of-service attack on the broker are to be put on a blacklist.</p> <p>YES Create a participant blacklist. NO Do not create a participant blacklist.</p> <p>See <i>Protecting a Broker against Denial-of-Service Attacks</i> in the platform-specific broker Administration documentation.</p>						
PARTNER-CLUSTER-ADDRESS	A32	R	z	u	w	v	b
	<p>This is the address of the load/unload broker in transport-method-style. Transport methods TCP and SSL are supported. See <i>Transport-method-style Broker ID</i> for more details. This attribute is required if the attribute RUN-MODE is specified.</p>						
PERCENTAGE-FOR-CONNECTION-SHORTAGE-MESSAGE	<u>90</u>   1-100	O	z	u	w	v	b
	<p>Broker will issue a message if the defined percentage value of TCP/IP connections (available file descriptors) is exceeded. Default is 90 percent of the available file descriptors.</p>						
POLL	<u>YES</u>   <u>NO</u>	O	z	u		v	
	<p>In earlier EntireX versions, the maximum number of TCP/IP connections per communicator was limited; see <i>Maximum TCP/IP Connections per</i></p>						

Attribute	Values	Opt/ Req	Operating System					
			z/OS	UNIX	Windows	z/VSE	BS2000	
	<p><i>Communicator</i> under <i>Broker Resource Allocation</i> for platform-specific list. With attribute <code>POLL</code> introduced in EntireX version 9.0, this restriction can be lifted under z/OS, UNIX and z/VSE.</p> <p>NO This setting is used to run the compatibility mode in Broker. The <code>poll()</code> system call is not used. The limitations described under <i>Maximum TCP/IP Connections per Communicator</i> under <i>Broker Resource Allocation</i> apply.</p> <p>YES The <code>poll()</code> system call is used to lift the resource restrictions with <code>select()</code> in multiplexing file descriptor sets.</p> <p><b>Note:</b> Setting this attribute to YES increases CPU consumption. <code>POLL=YES</code> is only useful if you need more than the maximum number of TCP/IP connections per communicator; we recommend <code>POLL=NO</code> to reduce CPU consumption.</p>							
PSTORE	<u>NO</u>   HOT   COLD	O	z	u	w	v	b	
	<p>Defines the status of the persistent store at broker startup, including the condition of persistent units of work (UOWs). With any value other than "NO", <code>PSTORE -TYPE</code> must be set.</p> <p>NO No persistent store.</p> <p>HOT Persistent UOWs are restored to their prior state during initialization.</p> <p>COLD Persistent UOWs are not restored during initialization, and the persistent store is considered empty.</p> <p><b>Note:</b> For a hot or cold start, the persistent store must be available when your broker is restarted.</p>							
PSTORE -REPORT	<u>NO</u>   YES	O	z	u	w	v	b	
	<p>Determines whether <code>PSTORE</code> report is created.</p> <p>NO Do not create the <code>PSTORE</code> report file.</p> <p>YES Create the <code>PSTORE</code> report file.</p> <p>See also <i>Persistent Store Report</i>.</p>							
PSTORE -TYPE	DIV (z/OS)   CTREE (UNIX, Windows)   Adabas (all platforms)   FILE (UNIX, Windows)	O	z	u	w	v	b	

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>Describes the type of persistent store driver required.</p> <p><b>DIV</b> Data in Virtual. z/OS only, and default on this platform. See <i>DIV-specific Attributes</i> below and <i>Implementing a DIV Persistent Store</i> under <i>Managing the Broker Persistent Store</i>.</p> <p><b>CTREE</b> c-tree database. UNIX and Windows only. See <i>c-tree-specific Attributes</i> and <i>c-tree Database as Persistent Store</i> in the UNIX and Windows Administration documentation.</p> <p><b>ADABAS</b> Adabas. All platforms. See also <i>Adabas-specific Attributes</i> (below) and <i>Managing the Broker Persistent Store</i> in the platform-specific Administration documentation.</p> <p><b>FILE</b> B-Tree database. UNIX and Windows only. No longer supported.</p>						
PSTORE-VERSION	2   3   4   5	O	z	u	w	v	b
	<p>Determines the version of the persistent store. PSTORE=COLD is not needed to upgrade the PSTORE to version 3. Any broker restart with PSTORE-VERSION=3 will upgrade the PSTORE version.</p> <p>PSTORE-VERSION=3 is needed for ICU support.</p> <p>The DIV PSTORE requires PSTORE-VERSION=4.</p> <p>PSTORE-VERSION=5 was added in EntireX version 10.1 to support 64-bit time values on z/OS, and unique message IDs on all platforms. See <i>Unique Message ID</i>. PSTORE-VERSION=5 significantly improvement Adabas PSTORE performance on all platforms. We strongly recommend you use this version.</p> <p><b>Caution:</b></p> <ul style="list-style-type: none"> <li>■ If you go back to PSTORE-VERSION=2 after upgrading to PSTORE-VERSION=3, the broker will only process data previously created with version 2. No version 3 data will be accessible.</li> <li>■ If you change the DIV PSTORE from version 3 to 4, perform a COLD restart for the change to take effect, or run <code>PSTORE UNLOAD/LOAD</code> first.</li> <li>■ If you change to PSTORE-VERSION=5, perform a COLD restart for the change to take effect.</li> </ul>						
RUN-MODE	STANDARD   STANDBY   PSTORE-LOAD   PSTORE-UNLOAD	O	z	u	w	v	b
	<p>Determines the initial run mode of the broker.</p>						

Attribute	Values	Opt/ Req	Operating System				
			S/Os	UNIX	Windows	z/VSE	BS2000
	<p>STANDARD Default value. Normal mode.</p> <p>STANDBY Deprecated. Supported for compatibility reasons.</p> <p>PSTORE-LOAD Broker will run as load broker to write Persistent Store data to a new persistent store. See also <i>Migrating the Persistent Store</i>.</p> <p>PSTORE-UNLOAD Broker will run as unload broker to read an existing persistent store and pass the data to a broker running in PSTORE-LOAD mode. See also <i>Migrating the Persistent Store</i>.</p>						
SECURITY	<p><u>NO</u>   YES</p> <p>Determines whether the EntireX Broker security exits are activated.</p> <p>NO The security exits are not activated.</p> <p>YES The security exits are activated. If the security routines cannot be activated, the broker will not start.</p> <p>Broker trace reports the type of security which is active and from where the security module USRSEC is loaded:</p> <ul style="list-style-type: none"> <li>■ EntireX Security</li> <li>■ User-written USRSEC.</li> </ul>	O	z	u	w	v	b
SECURITY-PATH	<p>A255</p> <p>Full path and file name of an executable file (for example, DLL for Windows or shared library for UNIX) containing the user security exit which the kernel will load and call. Example:</p> <p><code>SECURITY-PATH=usersec.dll</code></p> <p>This assumes the DLL is in the default path. Or:</p> <p><code>SECURITY-PATH=c:\brokerexit\yoursecu.dll</code></p> <p>If the path name contains spaces, enclose it in quotation marks. Example:</p>	O	z	u	w		b

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	SECURITY-PATH="c:\Software AG\broker exit\yoursecu.dll"						
	<p><b>Note:</b> This attribute is used only when implementing a user-written security exit.</p>						
SERVER-DEFAULT	<i>n</i>   UNLIM	O	z	u	w	v	b
	<p>Default number of servers that are allowed for every service.</p> <p><i>n</i> Number of servers.</p> <p>UNLIM The number of servers is restricted only by the number of servers globally available. Precludes the use of NUM-SERVER=AUTO.</p> <p>This value can be overridden by specifying a SERVER-LIMIT for the service. A value of 0 (zero) is invalid.</p>						
SERVICE-UPDATES	YES   NO	O	z	u	w	v	b
	<p>Switch on/off the automatic update mode of the broker.</p> <p>YES The broker reads the attribute file whenever a service registers for the first time. This allows the broker to honor modifications in the attribute file <i>without</i> a restart. The attribute file is read only when the first server registers for a particular service; it is not reread when a second replica is activated.</p> <p>NO The attribute file is read only once during broker startup. Any changes to the attribute file will be honored only if the broker is restarted.</p>						
SHORT-BUFFER-DEFAULT	UNLIM   <i>n</i>	O	z	u	w	v	b
	<p>Number of short buffers to be allocated for each service.</p> <p>UNLIM The number of short message buffers is restricted only by the number of buffers globally available. Precludes the use of NUM-SHORT-BUFFER=AUTO.</p> <p><i>n</i> Number of buffers.</p> <p>This value can be overridden by specifying a SHORT-BUFFER-LIMIT for the service. A value of 0 (zero) is invalid.</p>						
STORAGE-REPORT	NO   YES	O	z	u	w	v	b
	<p>Create a storage report about broker memory usage.</p> <p>NO Do not create the storage report.</p> <p>YES Create the storage report.</p>						

Attribute	Values	Opt/ Req	Operating System							
			z/OS	UNIX	Windows	z/VSE	BS2000			
	See <i>Storage Report</i> .									
STORE	OFF   BROKER	O	z	u	w	v	b			
	Sets the default STORE attribute for all units of work. This attribute can be overridden by the STORE field in the Broker ACI control block.									
	OFF Units of work are not persistent. BROKER Units of work are persistent.									
TRACE-DD	A255	O	z							
	A string containing data set attributes enclosed in quotation marks. These attributes describe the trace output file and must be defined if you are using using a GDG (generation data group) as output data set. See <i>Flushing Trace Data to a GDG Data Set</i> under <i>Tracing EntireX Broker</i> .									
	The following keywords are supported as part of the TRACE-DD value:									
	<ul style="list-style-type: none"> <li>■ DATACLAS</li> <li>■ DCB including BLKSIZE, DSORG, LRECL, RECFM</li> <li>■ DISP</li> <li>■ DSN</li> <li>■ MGMTCLAS</li> <li>■ SPACE</li> <li>■ STORCLAS</li> <li>■ UNIT</li> </ul>									
	Refer to your JCL Reference Manual for a complete description of the syntax.									
	Example:									
	<pre>TRACE-DD = "DSNAME=EXX.GDG,             DCB=(BLKSIZE=1210,DSORG=PS,LRECL=121,RECFM=FB),             DISP=(NEW,CATLG,CATLG),             SPACE=(CYL,(100,10)),             STORCLAS=SMS"</pre>									
	<b>Note:</b> If you specify TRACE-DD, you must also specify TRMODE=WRAP and a value for TRBUFNUM for the setting to take effect.									
TRACE-FILE-SIZE	n   nK   nM   nG	O		u	w					
	Defines the size of one trace file in kilobytes, megabytes or gigabytes. If this size is exceeded, a new trace file is allocated until the maximum number of									

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	trace files specified with MAX-TRACE-FILES is reached. There is no default value. These two parameters help prevent a constantly growing ETB.LOG file. See <i>Trace File Handling</i> in the UNIX and Windows Administration documentation.						
TRACE-LEVEL	0 - 4	O	z	u	w	v	b
	<p>The level of tracing to be performed while the broker is running.</p> <p>0 No tracing. Default value.</p> <p>1 Traces incoming requests, outgoing replies, resource usage and conversion errors.</p> <p>2 All of trace level 1, plus all main routines executed.</p> <p>3 All of trace level 2, plus all routines executed.</p> <p>4 All of trace level 3, plus Broker ACI control block displays.</p> <p>Trace levels 2, 3 and 4 should be used only when requested by Software AG support.</p> <p>If you modify the TRACE-LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE-LEVEL without a broker restart, use Command Central or the EntireX Broker command-line utility ETBCMD.</p>						
TRANSPORT	TCP-NET   TCP   SSL   NET	O	z			v	b
	TCP   SSL	O		u	w		
	<p>The broker transport may be specified as any combination of one or more of the following methods:</p> <p>TCP TCP/IP is supported.</p> <p>SSL SSL/TLS is supported.</p> <p>NET Entire Net-Work is supported. This value is not supported for a broker under UNIX or Windows.</p> <p><b>Examples:</b></p> <p>TRANSPORT=NET specifies that only the Entire Net-Work transport method will be supported by the broker.</p> <p>TRANSPORT=TCP-NET specifies that both the TCP/IP and Net-Work transport methods will be supported by the broker.</p>						

Attribute	Values	Opt/ Req	Operating System				
			S/O	UNIX	Windows	z/SE	BS2000
	<p>TRANSPORT=TCP-SSL-NET specifies that the TCP/IP, SSL/TLS, and Entire Net-Work transport methods will be supported by the broker.</p> <p>The parameters for each transport method are described in the respective section: TCP   SSL   NET.</p>						
TRAP - ERROR	<i>nnnn</i>	O	z	u	w		b
	<p>Where <i>nnnn</i> is the four-digit API error number that triggers the trace handler, for example 0007 (Service not registered). Leading zeros are not required. There is no default value.</p> <p>See <i>Deferred Tracing</i> in the platform-specific Broker Administration documentation.</p>						
TRBUFNUM	<i>n</i>	O	z	u	w		b
	<p>Changes the trace to write trace data to internal trace buffers. <i>n</i> is the size of the trace buffer in 64 KB units. There is no default value.</p>						
TRMODE	WRAP	O	z	u	w		b
	<p>Changes the trace mode. "WRAP" is the only possible value. This value instructs broker to write the trace buffer (see TRBUFNUM) if an event occurs. This event is triggered by a matching TRAP - ERROR during request processing or when an exception occurs.</p>						
UMSG	See MAX-MESSAGES-IN-UOW.						
UOW-DATA-LIFETIME	<u>1D</u>   <i>nS</i>   <i>nM</i>   <i>nH</i>   <i>nD</i>	O	z	u	w	v	b
	<p>Defines the default lifetime for units of work for the service.</p> <p><i>nS</i> Number of seconds the UOW can exist (max. 2147483647).  <i>nM</i> Number of minutes the UOW can exist (max. 35791394).  <i>nH</i> Number of hours the UOW can exist (max. 596523).  <i>nD</i> Number of days the UOW can exist (max. 24855).</p> <p>If the UOW is inactive - that is, is not processed within the time limit - it is deleted and given a status of "TIMEOUT". This attribute can be overridden by the UWTIME field in the Broker ACI control block.</p> <p>See <i>Timeout Considerations for EntireX Broker</i>.</p>						
UOW-MSG	See MAX-MESSAGES-IN-UOW.						
UOW-STATUS-LIFETIME	<u>no value</u>   <i>n[S]</i>   <i>nM</i>   <i>nH</i>   <i>nD</i>	O	z	u	w	v	b

Attribute	Values	Opt/ Req	Operating System							
			z/OS	UNIX	Windows	z/SE	BS2000			
	<p>The value to be added to the UOW-DATA-LIFETIME (lifetime of associated UOW). If a value is entered, it must be 1 or greater; a value of 0 will result in an error. If no value is entered, the lifetime of the UOW <i>status</i> information will be the same as the lifetime of the UOW itself.</p> <p><i>nS</i> Number of seconds the UOW status exists longer than the UOW itself (max. 2147483647).  <i>nM</i> Number of minutes (max. 35791394).  <i>nH</i> Number of hours (max. 596523).  <i>nD</i> Number of days (max. 24855).</p> <p>The lifetime determines how much additional time the UOW status is retained in the persistent store and is calculated from the time at which the associated UOW enters any of the following statuses: PROCESSED, TIMEOUT, BACKEDOUT, CANCELLED, DISCARDED. The additional lifetime of the UOW status is calculated only when broker is executing. Value in UOW-STATUS-LIFETIME supersedes the value (if specified) in attribute UWSTATP.</p> <p><b>Note:</b> If no unit is specified, the default unit is seconds. The unit does not have to be identical to the unit specified for UOW-DATA-LIFETIME.</p>									
UWSTAT-LIFETIME	Alias for UOW-STATUS-LIFETIME.									
UWSTATP	<u>Q</u>   <i>n</i>	<u>O</u>	<u>z</u>	<u>u</u>	<u>w</u>	<u>v</u>	<u>b</u>	<p>Contains a multiplier used to compute the lifetime of a persistent status for the service. The UWSTATP value is multiplied by the UOW-DATA-LIFETIME value (the lifetime of the associated UOW) to determine the length of time the status will be retained in the persistent store.</p> <p>0 The status is not persistent.            1 - 254 Multiplied by the value of UOW-DATA-LIFETIME to determine how long a persistent status will be retained.</p> <p><b>Note:</b> This attribute has not been supported since EntireX version 7.3. Use UOW-STATUS-LIFETIME instead.</p>		
UWTIME	Alias for UOW-DATA-LIFETIME.									
WAIT-FOR-ACTIVE-PSTORE	<u>NO</u>   YES	<u>O</u>	<u>z</u>	<u>u</u>	<u>w</u>	<u>v</u>	<u>b</u>	<p>Determines whether broker should wait for the Adabas Persistent Store to become active, or until c-tree PSTORE files become available.</p>		

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>NO If broker should start with a PSTORE - TYPE=ADABAS and the database is not active or is not accessible, broker will stop.</p> <p>If broker should start with a PSTORE - TYPE=CTREE and the c-tree files are still in use, broker will stop.</p> <p>YES If broker should start with a PSTORE - TYPE=ADABAS and the database is not active or is not accessible, broker will retry every 10 seconds to initiate communications with the PSTORE. Broker will reject any user requests until it is able to contact the Adabas database.</p> <p>If broker should start with a PSTORE - TYPE=CTREE and the c-tree files are still in use, broker will retry every 10 seconds to rebuild the persistent data. Broker will reject any user requests until it is able to rebuild the persistent data.</p>						
WORKER-MAX	32   <i>n</i> (min. 1, max. 32)	O	z	u	w		b
	Maximum number of worker tasks the broker can use.						
WORKER-MIN	1   <i>n</i> (min. 1, max. 32)	O	z	u	w		b
	Minimum number of worker tasks the broker can use.						
WORKER-NONACT	70S   <i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	O	z	u	w		b
	<p>Non-activity time to elapse before a worker tasks is stopped.</p> <p><i>n</i> Same as <i>nS</i>.</p> <p><i>nS</i> Non-activity time in seconds (default 70, max. 2147483647).</p> <p><i>nM</i> Non-activity time in in minutes (max. 35791394).</p> <p><i>nH</i> Non-activity time in hours (max. 596523).</p> <p><b>Caution:</b> A value of 0 (zero) is invalid. If you set this value too low, additional overhead is required for starting and stopping worker tasks. The default and recommended value is 70S.</p>						
WORKER-QUEUE-DEPTH	1   <i>n</i> (min. 1)	O	z	u	w		b
	Number of unassigned user requests in the input queue before another worker task gets started. The default and recommended value is 1. A higher value will result in longer broker response times.						
WORKER-START-DELAY	<i>internal-value</i>   <i>n</i>	O	z	u	w		b
	<i>n</i> Delay is extended by <i>n</i> seconds.						

Attribute	Values	Opt/ Req	Operating System							
			z/OS	UNIX	Windows	z/VSE	BS2000			
	<p>Delay after a successful worker task invocation before another worker task can be started to handle current incoming workload. This attribute is used to avoid the risk of recursive invocation of worker tasks, because starting a worker task itself causes workload increase.</p> <p>If no value is specified, an internal value calculated by the broker is used to optimize dynamic worker management. This calculated value is the maximum time required to start a worker task.</p>									

## Service-specific Attributes

Each section begins with the keyword `DEFAULTS=SERVICE`. Services with common attribute values can be grouped together. The attributes defined in the grouping apply to all services specified within it. However, if a different attribute value is defined immediately following the service definition, that new value applies. See also the sections *Wildcard Service Definitions* under *Broker Attributes* and *Service Update Modes* below the table.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
APPLICATION-MONITORING or APPMON	YES   <u>NO</u>	O	z	u	w	v	
<p>YES Enable application monitoring for the specified services.                      NO Disable application monitoring for the specified services.</p> <p>See <i>Application Monitoring</i>.</p>							
APPLICATION-MONITORING-NAME or APPMON-NAME	A100	O	z	u	w	v	
<p>Specifies the application monitoring name. Used to set the value of the <b>ApplicationName</b> KPI.</p> <p>If omitted, the default value from the APPLICATION-MONITORING section is used. If this value is also not specified, the corresponding CLASS/SERVER/SERVICE names are used.</p> <p>See <i>Application Monitoring</i>.</p>							
CLASS	A32 (case-sensitive)	R	z	u	w	v	b
<p>Part of the name that identifies the service together with the SERVER and SERVICE attributes. CLASS must be specified first, followed immediately by SERVER and SERVICE.</p> <p>Classes starting with any of the following are reserved for use by Software AG and should not be used in customer-written applications: BROKER, SAG, ENTIRE, ETB, RPC, ADABAS, NATURAL. Valid characters for class name are letters a-z, A-Z, numbers 0-9, hyphen and underscore. Do not use dollar, percent, period or comma. See also the restriction for SERVICE attribute names.</p>							
CLIENT-RPC-AUTHORIZATION	<u>N</u>   Y	O	z				b

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>Determines whether this service is subject to RPC authorization checking.</p> <p>N No RPC authorization checking is performed.</p> <p>Y RPC library and program name are appended to the authorization check performed by EntireX Security. Specify "YES" only to RPC-supported services.</p> <p>To allow conformity with Natural Security, the CLIENT-RPC-AUTHORIZATION parameter can optionally be defined with a prefix character as follows: CLIENT-RPC-AUTHORIZATION=(YES,&lt;prefix-character&gt;).</p>						
CONV-LIMIT	<u>UNLIM</u>   <i>n</i>	O	z	u	w	v	b
	<p>Allocates a number of conversations especially for this service.</p> <p><u>UNLIM</u> The number of conversations is restricted only by the number of conversations globally available. Precludes the use of NUM-CONVERSATION=AUTO in the Broker section of the attribute file.</p> <p><i>n</i> Number of conversations.</p> <p>A value of 0 (zero) is invalid.</p> <p>If NUM-CONVERSATION=AUTO is specified in the Broker section of the attribute file, CONV-LIMIT=UNLIM is not allowed in the service section. A value must be specified or the CONV-LIMIT attribute must be suppressed entirely for the service so that the default (CONV-DEFAULT) becomes active.</p>						
CONV-NONACT	<u>5M</u>   <i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	R	z	u	w	v	b
	<p>Non-activity time for connections.</p> <p><i>n</i> Same as <i>nS</i>.</p> <p><i>nS</i> Non-activity time in seconds (max. 2147483647).</p> <p><i>nM</i> Non-activity time in minutes (max. 35791394).</p> <p><i>nH</i> Non-activity time in hours (max. 596523).</p> <p>A value of 0 (zero) is invalid. If a connection is not used for the specified time, that is, a server or a client does not issue a broker request that references the connection in any way, the connection is treated as inactive and the allocated resources are freed.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
CONVERSION	Format: A255  ( SAGTCHA [, TRACE =n] [, <i>OPTION</i> =s]   SAGTRPC [, TRACE =n] [, <i>OPTION</i> =s]   name [, TRACE =n]   NO )	O	z	u	w	v	b
<p>Defines ICU conversion or SAGTRPC user exit for character conversion. See <i>Internationalization with EntireX</i>.</p> <p>SAGTCHA <sup>(1)</sup> Conversion using ICU Conversion for <i>ACI-based Programming</i>.</p> <p>SAGTRPC <sup>(2)</sup> Conversion using ICU Conversion for <i>RPC-based Components and Reliable RPC</i>.</p> <p>&lt;name&gt; <sup>(3)</sup> Name of the SAGTRPC user exit for <i>RPC-based components and Reliable RPC</i>. See also <i>Configuring SAGTRPC User Exits</i> under <i>Configuring Broker for Internationalization</i> in the platform-specific Administration documentation and <i>Writing SAGTRPC User Exits</i> under <i>Configuring Broker for Internationalization</i> in the platform-specific Administration documentation.</p> <p>NO If conversion is not to be used, either omit the CONVERSION attribute or specify CONVERSION=NO, for example for binary payload.</p> <p>The CONVERSION attribute overrides the TRANSLATION attribute when defined for a service. That is, when TRANSLATION and CONVERSION are both defined, TRANSLATION will be ignored.</p> <p><b>Note:</b></p> <ol style="list-style-type: none"> <li>See also <i>Configuring ICU Conversion</i> under <i>Configuring Broker for Internationalization</i> in the platform-specific Administration documentation.</li> <li>SAGTRPC is not supported on BS2000. For conversion with single-byte code pages, use SAGTCHA on BS2000 for <i>RPC-based Components and Reliable RPC</i>.</li> </ol>							

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
	<p>3. SAGTRPC user exit is not supported on z/VSE and BS2000.</p> <p><b>TRACE</b></p> <p>If tracing is switched on, the trace output is written to the broker log file:</p> <p>0 No tracing</p> <p>1 Trace level STANDARD This level is an "on-error" trace. It provides information on conversion errors only. For RPC calls this includes the IDL library, IDL program and the data. Please note that if <i>OPTION Values for Conversion</i> are set, errors are ignored.</p> <p>2 Trace level ADVANCED Tracing of incoming, outgoing parameters and the payload.</p> <p>3 Trace level SUPPORT This trace level is for support diagnostics and should only be switched on when requested by Software AG support.</p> <p><b>OPTION</b></p> <p>See table of possible values under <i>OPTION Values for Conversion</i>.</p>						
DEFERRED	<u>NO</u>   YES	O	z	u	w	v	b
	<p>NO Units of work cannot be sent to the service until it is available.</p> <p>YES Units of work can be sent to a service that is not up and registered. The units of work will be processed when the service becomes available.</p>						
LOAD-BALANCING	<u>YES</u>   NO	O	z	u	w	v	b
	<p>YES When servers that offer a particular service are started, new conversations will be assigned to these servers in a round-robin fashion. The first waiting server will get the first new conversation, the second waiting server will get the second new conversation, and so on.</p> <p>NO A new conversation is always assigned to the first server in the queue.</p>						
LONG-BUFFER-LIMIT	<u>UNLIM</u>   <i>n</i>	O	z	u	w	v	b
	<p>Allocates a number of long message buffers for the service.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>UNLIM The number of long message buffers is restricted only by the number of buffers globally available. Precludes the use of NUM-LONG-BUFFER=AUTO in the Broker section of the attribute file.</p> <p><i>n</i> Number of long message buffers.</p> <p>A value of 0 (zero) is invalid. If NUM-LONG-BUFFER=AUTO is specified in the Broker section of the attribute file, LONG-BUFFER-LIMIT=UNLIM is not allowed in the service section. A value must be specified or the LONG-BUFFER-LIMIT attribute must be suppressed entirely for the service so that the default (LONG-BUFFER-DEFAULT) becomes active.</p>						
MAX-MESSAGES-IN-UOW	<u>16</u>   <i>n</i>	O	z	u	w	v	b
	Maximum number of messages in a UOW.						
MAX-MESSAGE-LENGTH	<u>2147483647</u>   <i>n</i>	O	z	u	w		b
	Maximum message size that can be sent to a service.						
	This is transport-dependent. The default value represents the highest positive number that can be stored in a four-byte integer.						
MAX-MSG	See MAX-MESSAGE-LENGTH.						
MAX-UOW-MESSAGE-LENGTH	See MAX-MESSAGE-LENGTH.						
MAX-UOWS	0   <i>n</i>	O	z	u	w	v	b
	<p>0 The service does not accept units of work, i.e. it processes only messages that are not part of a UOW. Using zero prevents the sending of UOWs to services that are not intended to process them.</p> <p><i>n</i> Maximum number of UOWs that can be active concurrently for the service. If you do not provide a MAX-UOWS value for the service, it defaults to the MAX-UOWS setting for the broker. If you provide a value that exceeds that of the broker, the service MAX-UOWS is set to the broker's MAX-UOWS value and a warning message is issued.</p> <p>Specify MAX-UOWS=0 for Natural RPC Servers. This restriction will be removed with a later release.</p>						
MUOW	See MAX-UOWS.						
NOTIFY-EOC	<u>NO</u>   YES	O	z	u	w	v	b

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>Specifies whether timed-out conversations are to be stored or discarded.</p> <p>NO Discard the EOC notifications if the server is not ready to receive.</p> <p>YES Store the EOC notifications if the server is not ready to receive and then notify the server if possible.</p> <p>If a server is not ready to receive an EOC notification, it can be stored or discarded. If it is stored, the server is notified, if possible, when it is ready to receive.</p> <p><b>Caution:</b> The behavior activated by this parameter can be relied upon only during a single lifetime of the broker kernel. Specifically, conversations containing units of work, whose lifetime can span multiple broker kernel sessions, cannot be assumed to show this behavior, even with NOTIFY - EOC=YES.</p>						
NUM - UOW	Alias for MAX - UOWS.						
POSTPONE - ATTEMPTS	<u>Q</u>   <i>n</i>	<b>O</b>	<b>z</b>	<b>u</b>	<b>w</b>		
	<p>Defines the number of attempts putting a received unit of work (UOW) due to SYNCPOINT option CANCEL on the postpone queue for later processing.</p> <p>0 All UOWs rejected by the receiver (SYNCPOINT option CANCEL) will be cancelled immediately. Attribute POSTPONE - DELAY is ignored.</p> <p><i>n</i> Defines the number of postpone attempts that are performed instead of considering the UOW finished due to SYNCPOINT option CANCEL; the UOW will be moved to the postpone queue and the UOW status will be changed to POSTPONED. These UOWs will be delivered to the receiver when the time specified with POSTPONE - DELAY has elapsed.</p> <p>The default value is 0. See <i>Postponing Units of Work</i>.</p>						
POSTPONE - DELAY	<u>Q</u>   <i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	<b>O</b>	<b>z</b>	<b>u</b>	<b>w</b>		
	<p>The length of time a UOW is kept in status POSTPONED.</p> <p>0 The postpone feature is disabled. Attribute POSTPONE - ATTEMPTS is ignored.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p><i>nS</i> Number of seconds the UOW stays unreadable in the postpone queue with status POSTPONED (max. 2147483647).</p> <p><i>nM</i> Number of minutes the UOW stays unreadable in the postpone queue with status POSTPONED (max. 35791394).</p> <p><i>nH</i> Number of hours the UOW stays unreadable in the postpone queue with status POSTPONED (max. 596523).</p> <p><i>nD</i> Number of days the UOW stays unreadable in the postpone queue with status POSTPONED (max. 24855).</p> <p>The status of the UOW will be changed from POSTPONED to ACCEPTED after elapsed POSTPONE-DELAY. This delay time does not affect the UOW-DATA-LIFETIME. The POSTPONE-DELAY must be less than UOW-STATUS-LIFETIME in order to make the UOW receivable again.</p> <p><b>Note:</b> By default, the postpone feature is disabled. However, if any value is specified, the minimum delay is 30 seconds. Any value entered that is less than 30 seconds will be increased to this value.</p>						
SERVER	A32 (case-sensitive)	R	z	u	w	v	b
	<p>Part of the name that identifies the service together with the CLASS and SERVICE attributes.</p> <p>CLASS must be specified first, followed immediately by SERVER and SERVICE.</p> <p>Valid characters for server name are letters a-z, A-Z, numbers 0-9, hyphen and underscore. Do not use dollar, percent, period or comma.</p>						
SERVER-DEFAULT	<i>n</i>   UNLIM	O	z	u	w	v	b
	<p>Default number of servers that are allowed for every service.</p> <p><i>n</i> Number of servers.</p> <p>UNLIM The number of servers is restricted only by the number of servers globally available. Precludes the use of NUM-SERVER=AUTO.</p> <p>A value of 0 (zero) is invalid.</p> <p>This value can be overridden by specifying a SERVER-LIMIT for the service.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
SERVER-LIMIT	<i>n</i>   UNLIM	O	z	u	w	v	b
<p>Allows a number of servers especially for this service.</p> <p><i>n</i> Number of servers.</p> <p>UNLIM The number of servers is restricted only by the number of servers globally available. Precludes the use of NUM-SERVER=AUTO in the Broker section of the attribute file.</p> <p>A value of 0 (zero) is invalid.</p> <p>If NUM-SERVER=AUTO is specified in the Broker section of the attribute file, SERVER-LIMIT=UNLIM is not allowed in the service section. A value must be specified or the SERVER-LIMIT attribute must be suppressed entirely for the service so that the default (SERVER-DEFAULT) becomes active.</p> <p><b>Note:</b> UNIX and Windows: This limit also includes any attach server you are using. Make sure you increase the number by one for each attach server you use.</p>							
SERVER-NONACT	<u>5M</u>   <i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	R	z	u	w	v	b
<p>Non-activity time for servers. A server that does not issue a broker request within the specified time limit is treated as inactive and all resources for the server are freed.</p> <p><i>n</i> Same as <i>nS</i>.</p> <p><i>nS</i> Non-activity time in seconds (max. 2147483647).</p> <p><i>nM</i> Non-activity time in minutes (max. 35791394).</p> <p><i>nH</i> Non-activity time in hours (max. 596523).</p> <p>If a server registers multiple services, the highest value of all the services registered is taken as non-activity time for the server.</p>							
SERVICE	A32 (case-sensitive)	R	z	u	w	v	b
<p>Part of the name that identifies the service together with the CLASS and SERVER attributes.</p> <p>CLASS must be specified first, followed immediately by SERVER and SERVICE.</p>							

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	The SERVICE attribute names "EXTRACTOR" and "DEPLOYMENT" are reserved for Software AG internal use and should not be used in customer-written applications. Valid characters for service name are letters a-z, A-Z, numbers 0-9, hyphen and underscore. Do not use dollar, percent, period or comma. See also the restriction for CLASS attribute names.						
SHORT-BUFFER-LIMIT	UNLIM   <i>n</i>	O	z	u	w	v	b
	<p>Allocates a number of short message buffers for the service.</p> <p>UNLIM The number of short message buffers is restricted only by the number of buffers globally available. Precludes the use of NUM-SHORT-BUFFER=AUTO in the Broker section of the attribute file.</p> <p><i>n</i> Number of short message buffers.</p> <p>If NUM-SHORT-BUFFER=AUTO is specified in the Broker section of the attribute file, SHORT-BUFFER-LIMIT=UNLIM is not allowed in the service section. A value must be specified or the SHORT-BUFFER-LIMIT attribute must be suppressed entirely for the service so that the default (SHORT-BUFFER-DEFAULT) becomes active.</p>						
STORE	OFF   BROKER	O	z	u	w	v	b
	<p>Sets the default STORE attribute for all units of work sent to the service.</p> <p>OFF Units of work are not persistent. BROKER Units of work are persistent.</p> <p>This attribute can be overridden by the STORE field in the Broker ACI control block.</p>						
TRANSLATION	Format: A255 NO   < <i>name</i> >	O	z	u	w	v	b
	<p>Activates translation user exit for character conversion.</p> <p>NO If translation is not to be used - e.g., for binary payload (broker messages) - either omit the TRANSLATION attribute or specify TRANSLATION=NO.</p> <p>&lt;<i>name</i>&gt; Name of Translation User Exit. See also <i>Configuring Translation User Exits</i> under <i>Configuring Broker for</i></p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p><i>Internationalization</i> in the platform-specific Administration documentation or <i>Writing Translation User Exits</i> under <i>Configuring Broker for Internationalization</i> in the platform-specific Administration documentation.</p> <p>The CONVERSION attribute overrides the TRANSLATION attribute when defined for a service; that is, when TRANSLATION and CONVERSION are both defined, TRANSLATION will be ignored.</p>						
UMSG	Alias for MAX-MESSAGES-IN-UOW.						
UOW-DATA-LIFETIME	<u>1D</u>   nS   nM   nH   nD	O	z	u	w	v	b
	<p>Defines the default lifetime for units of work for the service.</p> <p>nS Number of seconds the UOW can exist (max. 2147483647).  nM Number of minutes the UOW can exist (max. 35791394).  nH Number of hours the UOW can exist (max. 596523).  nD Number of days the UOW can exist (max. 24855).</p> <p>If the unit of work (UOW) is inactive, that is, not processed within the time limit, it is deleted and given a status of TIMEOUT. This attribute can be overridden by the UWTIME field in the Broker ACI control block.</p>						
UOW-MSG	Alias for MAX-MESSAGES-IN-UOW.						
UOW-STATUS-LIFETIME	<u>no value</u>   n[S]   nM   nH   nD	O	z	u	w	v	b
	<p>The value to be added to the UOW-DATA-LIFETIME (lifetime of associated UOW). If a value is entered, it must be 1 or greater; a value of 0 will result in an error. If no value is entered, the lifetime of the UOW <i>status</i> information will be the same as the lifetime of the UOW itself.</p> <p>nS Number of seconds the UOW status exists longer than the UOW itself (max. 2147483647).  nM Number of minutes (max. 35791394).  nH Number of hours (max. 596523).  nD Number of days (max. 24855).</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>The lifetime determines how much additional time the UOW status is retained in the persistent store and is calculated from the time at which the associated UOW enters any of the following statuses: PROCESSED, TIMEOUT, BACKEDOUT, CANCELLED, DISCARDED. The additional lifetime of the UOW status is calculated only when broker is executing. Value in UOW-STATUS-LIFETIME supersedes the value (if specified) in attribute UWSTATP.</p> <p><b>Note:</b> If no unit is specified, the default unit is seconds. The unit does not have to be identical to the unit specified for UOW-DATA-LIFETIME.</p>						
UWSTATP	Q   n	O	z	u	w	v	b
	<p>Contains a multiplier used to compute the lifetime of a persistent status for the service. The UWSTATP value is multiplied by the UOW-STATUS-LIFETIME value (the lifetime of the associated UOW) to determine the length of time the status will be retained in the persistent store.</p> <p>0 The status is not persistent.                      1 - 254 Multiplied by the value of UOW-DATA-LIFETIME to determine how long a persistent status will be retained.</p> <p><b>Note:</b> This attribute has not been supported since EntireX version 7.3. Use UOW-STATUS-LIFETIME instead.</p>						
UWSTAT-LIFETIME	Alias for UOW-STATUS-LIFETIME.						
UWTIME	Alias for UOW-DATA-LIFETIME.						

### Wildcard Service Definitions

The special names of CLASS = \*, SERVER = \* and SERVICE = \* are allowed in the service-specific and authorization rule-specific sections of the broker attribute file. These are known as "wildcard" service definitions. If this name is present in the attribute file, any service that registers with the broker and does not have its own entry in the attribute file will inherit the attributes that apply to the first wildcard service definition found.

For example, a server that registers with CLASS=AClass, SERVER=AServer and SERVICE=AService can inherit attributes from any of the following entries in the attribute file (this list is not necessarily complete):

```

CLASS = *, SERVER = ASERVER, SERVICE = ASERVICE
CLASS = ACLASS, SERVER = *, SERVICE = *
CLASS = *, SERVER = *, SERVICE = *

```

Of course, if there is a set of attributes that are specifically defined for `CLASS=AClass`, `SERVER=ASERVER`, `SERVICE=ASERVICE`, then all of the wildcard service definitions will be ignored in favor of the exact matching definition.

## Service Update Modes

EntireX has two modes for handling service-specific attributes. See broker-specific attribute `SERVICE-UPDATES`.

- In **service update mode** (`SERVICE-UPDATES=YES`), the service configuration sections of the attribute file are read whenever the first replica of a particular service registers.
- In **non-update mode** (`SERVICE-UPDATES=NO`), the attribute file is not reread. All attributes are read during startup and the broker does not honor any changes in the attribute file. This mode is useful if
  - there is a high frequency of `REGISTER` operations, or
  - the attribute file is rather large and results in a high I/O rate for the broker.

The disadvantage to using non-update mode is that if specific attributes are modified, the broker must be restarted to effect the changes. Generally, this mode should be used only if the I/O rate of the broker is considerably high, and if the environment seldom changes.

## OPTION Values for Conversion

The different option values allow you to either handle character conversion deficiencies as errors, or to ignore them:

1. Do not ignore any character conversion errors and force an error always (value `STOP`). This is the default behavior.
2. Ignore if characters can not be converted into the receiver's codepage, but force an error if sender characters do not match the sender's codepage (value `SUBSTITUTE-NONCONV`).
3. Ignore any character conversion errors (values `SUBSTITUTE` and `BLANKOUT`).

Situations 1 and 2 above are reported to the broker log file if the `TRACE` option for `CONVERSION` is set to level 1.

Value	Description	Options Supported for		Report Situation in Broker Log File if TRACE Option for CONVERSION is set to 1	
		SAGTCHA	SAGTRPC	Bad Input Characters (Sender's Codepage)	Non-convertible Characters (Receiver's Codepage)
		SUBSTITUTE	Substitutes both non-convertible characters (receiver's codepage) and bad input characters (sender's codepage) with a codepage-dependent default replacement character.	yes	yes
SUBSTITUTE - NONCONV	If a corresponding code point is not available in the receiver's codepage, the character cannot be converted and is substituted with a codepage-dependent default replacement character. Bad input characters in sender's codepage are not substituted and result in an error.	yes	yes	Write detailed conversion error message.	No message.
BLANKOUT	Substitutes non-convertible characters with a codepage-dependent default replacement; blanks out the complete RPC IDL field containing one or more bad input characters.	no	yes	No message.	No message.
STOP	Signals an error on detecting a non-convertible or bad input character. This is the default behavior if no option is specified.	yes	yes	Write detailed conversion error message.	Write detailed conversion error message.

## Codepage-specific Attributes

The codepage-specific attribute section begins with the keyword `DEFAULTS=CODEPAGE` as shown in the sample attribute file. You can use the attributes in this section to customize the broker's locale string defaults and customize the mapping of locale strings to codepages for character conversion with ICU conversion and SAGTRPC user exit. See *Internationalization with EntireX* for more information.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
DEFAULT_ASCII	Any ICU converter name or alias. See also <a href="#">Additional Notes</a> below.	O	z	u	w	v	b
<p>Customize the broker's locale string defaults by assigning the default codepage for EntireX components (client or server). See <i>Broker's Locale String Defaults</i>. This value is used instead of the broker's locale string defaults if</p> <ul style="list-style-type: none"> <li>■ the calling component does not send a locale string itself, and</li> <li>■ the calling component is running on an ASCII platform (UNIX, Windows, etc.)</li> </ul> <p>Example:</p> <pre>DEFAULTS=CODEPAGE  * Broker Locale String Defaults  DEFAULT_ASCII=windows-950</pre> <p>For more examples, see <i>Configuring Broker's Locale String Defaults</i> and also <a href="#">Additional Notes</a> below.</p>							
DEFAULT_EBCDIC_IBM	Any ICU converter name or alias	O	z	u	w	v	b
<p>Customize the broker's locale string defaults by assigning the default codepage for EntireX components (client or server). See <i>Broker's Locale String Defaults</i>. This value is used instead of the broker's locale string defaults if</p> <ul style="list-style-type: none"> <li>■ the calling component does not send a locale string itself and</li> </ul>							

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
	<ul style="list-style-type: none"> <li>the calling component is running on an IBM mainframe platform (z/OS, z/VSE etc.)</li> </ul> <p>Example:</p> <pre>DEFAULT=CODEPAGE   DEFAULT_EBCDIC_IBM=ibm-937</pre> <p>For more examples, see <i>Configuring Broker's Locale String Defaults</i> and also <a href="#">Additional Notes</a> below.</p>						
DEFAULT_EBCDIC_SNI	Any ICU converter name or alias	O	z	u	w	v	b
	<p>Customize the broker's locale string defaults by assigning the default codepage for EntireX components (client or server). See <i>Broker's Locale String Defaults</i>. This value is used instead of the locale string defaults if</p> <ul style="list-style-type: none"> <li>the calling component does not send a locale string itself, and</li> <li>the calling component is running on a Fujitsu EBCDIC mainframe platform (BS2000)</li> </ul> <p>Example:</p> <pre>DEFAULT=CODEPAGE   DEFAULT_EBCDIC_SNI= bs2000-edf03drv</pre> <p>For more examples, see <i>Configuring Broker's Locale String Defaults</i> and also <a href="#">Additional Notes</a> below.</p>						
locale-string	Any ICU converter name or alias. See also <a href="#">Additional Notes</a> below.	O	z	u	w	v	
	<p>Customize the mapping of locale strings to codepages and bypass the broker's locale string processing mechanism. See <i>Broker's Locale String Processing</i>. This is useful:</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<ul style="list-style-type: none"> <li>■ if the broker's locale string processing fails - i.e. leads to no codepage or to the wrong codepage - you can explicitly assign the codepage which meets your requirements.</li> <li>■ if you want to install user-written ICU converters (codepages) into the broker, see <i>Building and Installing ICU Custom Converters</i> in the platform-specific Administration documentation.</li> </ul> <p>The attribute (locale string) is the locale string sent by your EntireX component (client or server) and the value is the codepage that you want to use in place of that locale string. In the first line of the example below, the client or server application sends ASCII as a locale string; the broker maps this to the codepage ISO 8859_1. In the same way EUC_JP_LINUX is mapped to ibm-33722_P12A-1999. All other locale strings are mapped by the broker's mapping mechanism, see <i>Broker's Built-in Locale String Mapping</i>. Example:</p> <pre> DEFAULTS=CODEPAGE * Broker Locale String Codepage Assignments ASCII=ISO8859 EUC_JP_LINUX=ibm-33722_P12A-1999 * Customer-written ICU converters CP1140=myebcdic CP0819=myascii                     </pre> <p>For more examples, see <i>Bypassing Broker's Built-in Locale String Mapping</i> and also <a href="#">Additional Notes</a> below.</p>						

**Additional Notes**

- Locale string matching is case insensitive when bypassing the broker's built-in mechanism, that is, when the broker examines the codepages section in the attribute file.
- If ICU is used for character conversion and the style is not known by ICU, e.g. <ll>\_<cc> etc., the name will be mapped to a suitable ICU alias. For more details on the mapping mechanism, see *Broker's Built-in Locale String Mapping*. For more details on ICU and ICU converter name standards, see *ICU Resources*.
- If SAGTRPC user exit is used for the character conversion, we recommend assigning the codepage in the form CP<nnnnn>. To determine the number given to SAGTRPC user exit, see *Broker's Built-in Locale String Mapping*.
- See CONVERSION on this page for the character conversion in use.

## Security-specific Attributes

The security-specific attribute section begins with the keyword `DEFAULTS=SECURITY` as shown in the sample attribute file. This section applies only if broker-specific attribute `SECURITY=YES` is specified.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VMSE	BS2000
ACCESS-SECURITY-SERVER	NO   YES	O					b
	<p>Determines where authentication is checked.</p> <p>NO Authentication is checked in the broker tasks. This requires broker to be running under TSOS in order to execute privileged security checks.</p> <p>YES Authentication is checked in the EntireX Broker Security Server for BS2000. This does not require broker to be running under TSOS. See <i>EntireX Broker Security Server for BS2000</i>.</p>						
APPLICATION-NAME	A8	O	z				
	<p>Specifies the name of the application to be checked if <code>FACILITY-CHECK=YES</code> is defined. In RACF, for example, an application "BROKER" with read permission for user "DOE" is defined with following commands:</p> <pre>RDEFINE APPL BROKER UACC(NONE) PERMIT BROKER CLASS(APPL) ID(DOE) ACCESS(READ) SETROPTS CLASSACT(APPL)</pre> <p>See attribute <code>FACILITY-CHECK</code> for more information.</p>						
AUTHORIZATION-DEFAULT	YES   NO	O		u	w		
	<p>Determines whether access is granted to a specified service if the specified could not be found listed in the repository of authorization rules or in section <code>DEFAULTS=AUTHORIZATION-RULES</code> of the attribute file.</p> <p>YES Grant access.</p> <p>NO Deny access.</p> <p>Applies only when using EntireX Security under UNIX and Windows. Authorization rules can be stored within a repository. When an authorization call occurs, EntireX Security uses the values of this parameter to perform an access check for a particular broker instance against an (authenticated) user ID and list of rules.</p> <p>See also <i>Authorization Rules</i>.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
CHECK-IP-ADDRESS	YES   <u>NO</u>	O	z				
	Determines whether the TCP/IP address of the caller is subject to a resource check.						
ERRTXT-MODULE	<u>NA2MSG0</u>   NA2MSG1   NA2MSG2   <i>ModuleName</i>	O	z				
	Specifies the name of the security error text module. Default is "NA2MSG0", English messages. For instructions on how to customize messages, see <i>Build Language-specific Messages (Optional)</i> under <i>Installing EntireX Security under z/OS</i> .						
FACILITY-CHECK	<u>NO</u>   YES	O	z				
	It is possible to check whether a particular user is at all allowed to use an application before performing a password check. The advantage of this additional check is that when the user is not allowed to use this application, the broker returns error 00080013 and does not try to authenticate the user. Failing an authentication check may lead to the user's password being revoked; this situation is avoided if the facility check is performed first. See attribute APPLICATION-NAME for further details.  <b>Note:</b> This facility check is an additional call to the security subsystem and is executed before each authentication call.						
IGNORE-STOKEN	<u>NO</u>   YES	O	z	u	w		b
	Determines whether the value of the ACI field SECURITY-TOKEN is verified on each call.						
INCLUDE-CLASS	<u>YES</u>   NO	O	z				
	Determines whether the class name is included in the resource check.						
INCLUDE-NAME	<u>YES</u>   NO	O	z				
	Determines whether the server name is included in the resource check.						
INCLUDE-SERVICE	<u>YES</u>   NO	O	z				
	Determines whether the service name is included in the resource check.						
LDAP-AUTHENTICATION-URL	<i>ldapUrl</i>	O		u	w		
	Authentication is performed against the LDAP repository specified under <i>ldapUrl</i> .  ■ <b>TCP</b> Specify repository URL:						

Attribute	Values	Opt/ Req	Operating System							
			S/Z	UNIX	Windows	Z/SE	BS2000			
	<p>LDAP-AUTHENTICATION-URL="ldap://HostName[:PortNumber]"</p> <p>■ <b>SSL/TLS</b> Specify repository URL with ldaps:</p> <p>LDAP-AUTHENTICATION-URL="ldaps://HostName[:PortNumber]"</p> <p>If no port number is specified, the default is the standard LDAP port number 389 for TCP transport. Examples for TCP and SSL/TLS:</p> <p>LDAP-AUTHENTICATION-URL="ldap://myhost.mydomain.com" LDAP-AUTHENTICATION-URL="ldaps://myhost.mydomain.com:636"</p>									
LDAP-AUTHORIZATION-URL	<i>ldapUrl</i>	O		u	w					
	<p>Authorization is performed against the LDAP repository specified under <i>ldapUrl</i>.</p> <p>■ <b>TCP</b> Specify repository URL:</p> <p>LDAP-AUTHORIZATION-URL="ldap://HostName[:PortNumber]"</p> <p>If no port number is specified, the default is the standard LDAP port number 389 for TCP transport. Example for TCP:</p> <p>LDAP-AUTHORIZATION-URL="ldap://myhost.mydomain.com:389"</p> <p>This attribute replaces the parameters <i>host</i>, <i>port</i> and <i>protocol</i> in the <i>xds.ini</i> file of EntireX version 9.10 and below.</p>									
LDAP-AUTH-DN	<i>authDN</i>	O		u	w					
	<p>For authenticated access to the LDAP server. Specifies the DN of the user. Default value:</p> <p>cn=admin,dc=software-ag,dc=de</p> <p>This attribute replaces parameter <i>authDN</i> in the <i>xds.ini</i> file of EntireX version 9.10 and below.</p>									
LDAP-AUTH-PASSWD-ENCRYPTED	<i>authPass</i>	O		u	w					
	<p>For authenticated access to the LDAP server. Specifies the encrypted value of the user password. Use program <i>etbnattr</i> to get the encrypted password:</p>									

Attribute	Values	Opt/ Req	Operating System				
			S/Z	UNIX	Windows	Z/SE	BS2000
	<code>etbnattr -x clear_text_password -echo_password_only</code> This writes the encrypted password to standard output. This attribute replaces parameter <code>authPass</code> in the <code>xds.ini</code> file of EntireX version 9.10 and below.						
LDAP - AUTHORIZATION - RULE	A32	O		u	w		
	List of authorization rules. Multiple sets of rules can be defined, each set is limited to 32 chars. The maximum number of LDAP - AUTHORIZATION - RULE entries in the attribute file is 16. Applies only when using EntireX Security under UNIX or Windows and <code>SECURITY - SYSTEM=lldapUrl</code> . Authorization rules can be stored in an LDAP repository. When an authorization call occurs, EntireX Security uses the values of this parameter and <code>AUTHORIZATION - DEFAULT</code> to perform an access check for a particular broker instance against an (authenticated) user ID and list of rules. See also <i>Authorization Rules</i> .						
LDAP - BASE - DN	<i>baseDN</i>	O		u	w		
	Specifies the base distinguished name of the directory object that is the root of all objects for authorization rules. Default value: <code>dc=software-ag,dc=de</code> This attribute replaces parameter <code>baseDN</code> in the <code>xds.ini</code> file of EntireX version 9.10 and below.						
LDAP - PERSON - BASE - BINDDN	<i>ldapDn</i>	O		u	w		
	Used with LDAP authentication to specify the distinguished name where authentication information is stored. This value is prefixed with the user ID field name (see below). Example: <code>LDAP - PERSON - BASE - BINDDN="cn=users,dc=mydomain,dc=com"</code>						
LDAP - REPOSITORY - TYPE	OpenLDAP   ActiveDirectory   SunOneDirectory   Tivoli   Novell   ApacheDS	O		u	w		
	Use predefined known fields for the respective repository type. Specify the repository type that most closely matches your actual repository. In the case of Windows Active Directory, the user ID is typically in the form <code>domainName\userId</code> .						
LDAP - SASL -	NO   YES	O			w		

Attribute	Values	Opt/Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
AUTHENTICATION	<p>Specifies whether or not Simple Authentication and Security Layer (SASL) is to perform the authentication check. In practice, this determines whether or not the password supplied by the user is passed in plain text between the broker kernel and the LDAP server. If SASL is activated, this implies that the password is encrypted.</p> <p>NO Password is sent to LDAP server in plain text.                      YES Password is sent to LDAP server encrypted.</p>						
LDAP-USERID-FIELD	<u>cn</u>   <i>uidFieldName</i>	O		u	w		
	<p>Used with LDAP authentication to specify the first field name of a user in the Distinguished Name, for example:                      LDAP-USERID-FIELD=<i>uid</i></p>						
MAX-SAF-PROF-LENGTH	1-256	O	z				
	<p>This parameter should be increased if the length of the resource checks - that is, the length of the profile comprising "&lt;class&gt;.&lt;server&gt;.&lt;service&gt;" - is greater than 80 bytes.                      This parameter defaults to 80 if a value is not specified.</p>						
PASSWORD-TO-UPPER-CASE	<u>NO</u>   YES	O	z			v	
	<p>Determines whether the password and new password are converted to uppercase before verification.</p>						
PRODUCT	<u>RACF</u>   ACF2   TOP-SECRET	O	z				
	<p>Specifies the name of the installed security product. This attribute is used to analyze security-system-specific errors. The following systems are currently supported:</p> <p>ACF2 Security system ACF2 is installed.                      RACF Security system RACF is installed. Default.                      TOP-SECRET Security system TOP-SECRET is installed.</p> <p>The default value is used if an incorrect or no value is specified.</p>						
PROPAGATE-TRUSTED-USERID	<u>YES</u>   NO	O	z				
	<p>Determines whether a client user ID obtained by means of the trusted user ID mechanism is propagated to a server using the ACI field CLIENT-USERID.</p>						
SAF-CLASS	<u>NBKSAG</u>   <i>SAFClassName</i>	O	z				
	<p>Specifies the name of the SAF class/type used to hold the EntireX-related resource profiles.</p>						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
SAF-CLASS-IP	<u>NBKSAG</u>   <i>SAFClass</i> Name	O	z				
Specifies the name of the SAF class/type used when performing IP address authorization checks.							
SECURITY-LEVEL	<u>AUTHORIZATION</u>   <u>AUTHENTICATION</u>	O	z	u	w	v	b
Specifies the mode of operation.  AUTHORIZATION Authorization and authentication (not under BS2000 or z/VSE). AUTHENTICATION Authentication.  <b>Note:</b> In version 8.0, the default value for this parameter was "AUTHORIZATION".							
SECURITY-NODE	YES   <i>name</i>	O	z				
This parameter can be used to specify a prefix that is added to all authorization checks, enabling different broker kernels, in different environments, to perform separate authorization checks according to each broker kernel. For example, it is often important to distinguish between production, test, and development environments.  YES This causes the broker ID to be used as a prefix for all authorization checks. <i>name</i> This causes the actual text (maximum 8 characters) to be prefixed onto all authorization checks.  <b>Note:</b> By <i>not</i> setting this parameter, no prefix is added to the resource check (the default behavior).							
SECURITY-SYSTEM	<u>OS</u>   LDAP	O	z	u	w		b
OS Authentication is performed against the local operating system. Default if SECURITY=YES is specified and section DEFAULTS=SECURITY is omitted from the attribute file.  LDAP Authentication and authorization are performed against the LDAP repository specified under LDAP-AUTHENTICATION-URL and LDAP-AUTHORIZATION-URL.							
TRACE-LEVEL	<u>0</u> - 4	O	z	u	w	v	b
Trace level for EntireX Security. It overrides the global value of trace level in the attribute file.  0 No tracing. Default value. 1 Log security violations and access denied/permited.							

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
	<p>2 All of trace level 1, plus internal errors.</p> <p>3 All of trace level 2, plus function entered/exit messages with argument values and some progress messages.</p> <p>4 All of trace level 3, plus some selected data areas for problem analysis.</p> <p>Trace levels 2, 3 and 4 should be used only when requested by Software AG support.</p> <p>If you modify the TRACE - LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE - LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.</p> <p><b>Note:</b> Setting this value also affects tracing for authorization rules.</p>						
TRUSTED-USERID	YES   NO	O	z				
	Activates the trusted user ID mechanism for broker requests arriving over the local Adabas IPC mechanism.						
USERID-TO-UPPER-CASE	NO   YES	O	z			v	
	Determines whether user ID is converted to uppercase before verification.						
UNIVERSAL	NO   YES	O	z				
	Determines whether access to undefined resource profiles is allowed.						
WARN-MODE	NO   YES	O	z	u	w		b
	Determines whether a resource check failure results in just a warning or an error.						

## TCP/IP-specific Attributes

The TCP/IP-specific attribute section begins with the keyword `DEFAULTS=TCP` as shown in the sample attribute file. It contains attributes that apply to the TCP/IP transport communicator. The transport is activated by `TRANSPORT=TCP` in the Broker-specific section of the attribute file. A maximum of five TCP/IP communicators can be activated by specifying up to five `HOST/PORT` pairs.

Attribute	Values	Opt/Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
CONNECTION-NONACT	<code>n   nS   nM   nH</code>	O	z	u	w	v	b
<p>Non-activity of the TCP/IP connection, after which a close is performed and the connection resources are freed. If this parameter is not specified here, broker will close the connection only when the application (or the network itself) terminates the connection.</p> <p><code>n</code> Same as <code>nS</code>.</p> <p><code>nS</code> Non-activity time in seconds (min. 600, max. 2147483647).</p> <p><code>nM</code> Non-activity time in minutes (min. 10, max. 35791394).</p> <p><code>nH</code> Non-activity time in hours (max. 596523).</p> <p>If not specified, the connection non-activity test is disabled. On the stub side, non-activity can be set with the environment variable <code>ETB_NONACT</code>. See <i>Limiting the TCP/IP Connection Lifetime</i> in the platform-specific <i>Stub Administration</i> sections of the EntireX documentation.</p>							
HOST	<code>0.0.0.0   HostName   IP address</code>	O	z	u	w	v	b
<p>The address of the network interface on which broker will listen for connection requests.</p> <p>If <code>HOST</code> is not specified, broker will listen on any attached interface adapter of the system (or stack).</p> <p>A maximum of five <code>HOST/PORT</code> pairs can be specified to start multiple instances of broker's TCP/IP transport communicator.</p>							
MAX-MESSAGE-LENGTH	<code>2147483647   n</code>	O	z	u	w	v	b

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	Maximum message size that the broker kernel can process using transport method TCP/IP. The default value represents the highest positive number that can be stored in a four-byte integer.						
PORT	1025 - 65535	O	z	u	w	v	b
	<p>The TCP/IP port number on which the broker will listen for connection requests.</p> <p>If not specified, the broker will attempt to find its TCP/IP port number from the TCP/IP services file, using <code>getservbyname</code>. If it cannot find the number here, the default value of 1971 is used.</p> <p>A maximum of five HOST/PORT pairs can be specified to start multiple instances of broker's TCP/IP transport communicator.</p>						
RESTART	YES   NO	O	z	u	w	v	b
	<p>YES The broker kernel will attempt to restart the TCP/IP communicator.</p> <p>NO The broker kernel will not try to restart the TCP/IP communicator.</p> <p>This setting applies to all TCP/IP communicators.</p>						
RETRY-LIMIT	20   n   UNLIM	O	z	u	w	v	b
	Maximum number of attempts to restart the TCP/IP communicator. This setting applies to all TCP/IP communicators.						
RETRY-TIME	3M   n   nS   nM   nH	O	z	u	w	v	b
	<p>Wait time between stopping the TCP/IP communicator due to an unrecoverable error and the next attempt to restart it.</p> <p><i>n</i> Same as <i>n</i> S.</p> <p><i>n</i> S Wait time in seconds (max. 2147483647).</p> <p><i>n</i> M Wait time in minutes (max. 35791394).</p> <p><i>n</i> H Wait time in hours (max. 596523).</p> <p>Minimum wait time is 1S.</p> <p>This setting applies to all TCP/IP communicators.</p>						
REUSE-ADDRESS	YES   NO	O	z	u		v	b
	YES   NO	O			w		

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>YES The TCP port assigned to the broker can be taken over and assigned to other applications (this is the default value on all non-Windows platforms).</p> <p>NO The TCP port assigned to the broker cannot be taken over and assigned to other applications. This is the default setting on Windows, and we strongly advise you do not change this value on this platform.</p> <p><b>Note:</b> This setting might be required at your site when restarting broker immediately after stopping it. This is due to the inherent latency of the TCP/IP stack when closing connections.</p>						
STACK - NAME	<i>StackName</i>	O	z				
	<p>Name of the TCP/IP stack that the broker is using.</p> <p>If not specified, broker will connect to the default TCP/IP stack running on the machine.</p>						
TRACE - LEVEL	0 - 4	O	z	u	w	v	b
	<p>The level of tracing to be performed while the broker is running with transport method TCP/IP. It overrides the global value of trace level for all TCP/IP routines.</p> <p>0 No tracing. Default value.</p> <p>1 Display IP address of incoming request, display error number of outgoing error responses.</p> <p>2 All of trace level 1, plus errors if request entries could not be allocated.</p> <p>3 All of trace level 2, plus all routines executed.</p> <p>4 All of trace level 3, plus function arguments and return values.</p> <p>Trace levels 2, 3 and 4 should be used only when requested by Software AG support.</p> <p>If you modify the TRACE - LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE - LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.</p>						

## c-tree-specific Attributes

The c-tree-specific attribute section begins with the keyword `DEFAULTS = CTREE`. The attributes in this section are optional. This section applies only if `PSTORE-TYPE = CTREE` is specified.

Not available under z/OS, BS2000, z/VSE.

Attribute	Values	Opt/Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
MAXSIZE	<i>n</i>   <i>nM</i>   <i>nG</i>	O		u	w		
<p>Defines the maximum size of c-tree data files. Broker allocates one data file for control data and another data file for message data:</p> <p><i>n</i> Maximum size in MB.  <i>nM</i> Maximum size in MB.  <i>nG</i> Maximum size in GB.</p>							
PAGESIZE	<i>n</i>   <i>nK</i>	O		u	w		
<p>Determines how many bytes are available in each c-tree node. <code>PSTORE COLD</code> start is required after changing this value.</p> <p><i>n</i> Same as <i>nK</i>  <i>nK</i> PAGESIZE in KB.</p> <p>The default and minimum value is 8 KB.</p> <p>If PSD Reason Code = 527 is returned during UOW write processing, increase the PAGESIZE value and restart broker with <code>PSTORE=COLD</code>, or migrate the existing PSTORE to a new PSTORE with an increased PAGESIZE value. See <i>Migrating the Persistent Store</i> and define the increased PAGESIZE value for the load broker.</p>							
PATH	A255	O		u	w		
<p>Path name of the target directory for c-tree index and data files.</p>							
SYNCIO	NO   YES	O		u	w		
<p>Controls the open mode of the c-tree transaction log.</p> <p>NO c-tree transaction log is not opened in synchronous mode. Default.          YES c-tree transaction log is opened in synchronous mode to improve data security. It may degrade performance of PSTORE operations, but offers the highest level of data security. See <i>c-tree Database as Persistent Store</i> in the UNIX and Windows Administration documentation.</p>							

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
TRACE-LEVEL	0 - 4	O		u	w		
<p>Trace level for c-tree persistent store. It overrides the global value of trace level in the attribute file.</p> <p>0 No tracing. Default value.            1 Log memory allocation failures and errors during close of files.            2 n/a            3 All of trace level 1, plus UOWID in use for the various ctree requests and function entered/exit messages.            4 All of trace level 3, plus returned function values.</p> <p>Trace levels 2, 3 and 4 should be used only when requested by Software AG support.</p> <p>If you modify the TRACE-LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE-LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.</p>							

## SSL/TLS-specific Attributes

The Broker can use Secure Sockets Layer/Transport Layer Security (SSL/TLS) as the transport medium. The term “SSL” in this section refers to both SSL and TLS. RPC-based clients and servers, as well as ACI clients and servers, are always SSL clients. The broker is always the SSL server. For an introduction see *SSL/TLS and Certificates with EntireX*.

The SSL-specific attribute section begins with the keyword `DEFAULTS=SSL` as shown in the sample attribute file. The attributes in this section are needed to execute the SSL communicator of the EntireX Broker kernel.

Attribute	Values	Opt/Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
CIPHER-SUITE	<i>string</i>	O	z	u	w		b
<p>String that is passed to the underlying SSL/TLS implementation. SSL/TLS is a standardized protocol that uses different cryptographic functions (hash functions, symmetric and asymmetric encryption etc.). Some of these must be implemented in the SSL/TLS stack; others are optional. When an SSL/TLS connection is created, both parties agree by "handshake" on the <i>cipher suite</i>, that is, the algorithms and key lengths used. In a default scenario, this information depends on what both sides are capable of. It can be influenced by setting the attribute CIPHER-SUITE for the SSL/TLS server side (the broker always implements the server side). Thus stubs connect to the broker and thereby become the SSL/TLS clients.</p> <p>Under UNIX, Windows and BS2000, the OpenSSL implementation is used; under z/OS it is GSK.</p> <p>The SSL protocol is obsolete and should no longer be used for secure operations. The TLS protocol is the successor of SSL and is readily available in OpenSSL and GSK. The following examples show how to configure strong encryption:</p> <ul style="list-style-type: none"> <li>■ <b>OpenSSL</b>                      This example uses FIPS-approved algorithms, but without ADH, MD5 or other low or export-grade implementations.                      It requires authentication and encryption, that is, do not use NULL ciphers:  <pre>CIPHER-SUITE=FIPS:!ADH:!LOW:!EXP:!MD5:!aNULL:!eNULL:@STRENGTH</pre>                     Default configuration:  <pre>CIPHER-SUITE=TLSv1:!ADH:!LOW:!EXP: !MD5:@STRENGTH</pre>                     See <a href="http://www.openssl.org/docs/apps/ciphers.html">http://www.openssl.org/docs/apps/ciphers.html</a> </li> </ul>							

Attribute	Values	Opt/ Req	Operating System							
			z/OS	UNIX	Windows	z/SE	BS2000			
	<p>■ <b>GSK</b> Default configuration:  CIPHER-SUITE=35363738392F303132330A1613100D</p> <p>This list of cipher suites starts with a strong '256-bit AES encryption with SHA-1 message authentication and RSA key exchange' (35) and ends with a relatively weak '168-bit Triple DES encryption with SHA-1 message authentication and fixed Diffie-Hellman key exchange signed with a DSA certificate' (0D).</p> <p>See IBM documentation: z/OS V2R1.0 System SSL Programming, SC14-7495-00, Appendix C: Cipher Suite Definitions.</p>									
CONNECTION-NONACT	<i>n</i>   <i>nS</i>   <i>nM</i>   <i>nH</i>	O	z	u	w		b			
	<p>Non-activity of the SSL connection, after which a close is performed and the connection resources are freed. If this parameter is not specified here, broker will close the connection only when the application (or the network itself) terminates the connection.</p> <p><i>n</i> Same as <i>nS</i>.  <i>nS</i> Non-activity time in seconds (min. 600, max. 2147483647).  <i>nM</i> Non-activity time in minutes (min. 10, max. 35791394).  <i>nH</i> Non-activity time in hours (max. 596523).</p> <p>If not specified, the connection non-activity test is disabled.</p>									
HOST	<i>hostname</i>	O	z	u	w		b			
	<p>The address of the network interface on which broker will listen for connection requests.</p> <p>If HOST is not specified, broker will listen on any attached interface adapter of the system (or stack).</p> <p>A maximum of five HOST/PORT pairs can be specified to start multiple instances of EntireX Broker's TCP/IP transport communicator.</p>									
KEY-LABEL	<i>name</i>	O	z							
	<p>The label of the key in the RACF keyring that is used to authenticate the broker kernel (see also TRUST-STORE parameter).</p> <p>Example: "ETBCERT".</p>									
KEY-FILE	<i>file name</i>	R		u	w		b			
	<p>File that contains the broker's private key (if not contained in KEY-STORE). For test purposes, EntireX delivers certificates for use on various platforms. See <i>SSL/TLS Sample Certificates Delivered with EntireX</i>.</p>									

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	Example for UNIX and Windows: <i>MyAppKey.pem</i> . <b>Note:</b> EntireX Broker does not support Java certificates (keystore files of type .jks).						
KEY - PASSWD	<i>password</i> (A32)	R		u	w		b
	Password used to protect the private key. Unlocks the KEY - FILE, for example <i>MyAppKey.pem</i> . Deprecated. See KEY - PASSWD - ENCRYPTED below.						
KEY - PASSWD - ENCRYPTED	<i>encrypted value</i> (A64)	R		u	w		b
	Password used to protect the private key. Unlocks the KEY - FILE, for example <i>MyAppKey.pem</i> . This attribute replaces KEY - PASSWD to avoid a clear-text password as attribute value. If KEY - PASSWD and KEY - PASSWD - ENCRYPTED are both supplied, KEY - PASSWD - ENCRYPTED takes precedence.						
KEY - STORE	<i>file name</i>	R		u	w		b
	SSL certificate; may contain the private key. For test purposes, EntireX delivers certificates for use on various platforms. See <i>SSL/TLS Sample Certificates Delivered with EntireX</i> .  Example for UNIX and Windows: <i>ExxAppCert.pem</i> . <b>Note:</b> EntireX Broker does not support Java certificates (keystore files of type .jks).						
MAX - MESSAGE - LENGTH	<u>2147483647</u>   <i>n</i>	O	z	u	w		b
	Maximum message size that the broker kernel can process using transport method SSL. The default value represents the highest positive number that can be stored in a four-byte integer.						
PORT	<i>1025 - 65535</i>	O	z	u	w		b
	The SSL port number on which the broker will listen for connection requests. If not changed, this parameter takes the standard value as specified in the example attribute file.  If the port number is not specified, the broker will use the default value of 1958.						
RESTART	<u>YES</u>   NO	O	z	u	w		b
	YES The broker kernel will attempt to restart the SSL communicator (this is the default value). NO The broker kernel will not attempt to restart the SSL communicator.						
RETRY - LIMIT	<u>20</u>   <i>n</i>   UNLIM	O	z	u	w		b
	Maximum number of attempts to restart the SSL communicator.						
RETRY - TIME	<u>3M</u>   <i>n</i>   <i>nS</i>   <i>nH</i>	O	z	u	w		b
	Wait time between suspending SSL communication due to unrecoverable error and the next attempt to restart it.						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p><i>n</i> Same as <i>nS</i>.</p> <p><i>nS</i> Wait time in seconds (max.2147483647).</p> <p><i>nM</i> Wait time in minutes (max. 35791394).</p> <p><i>nH</i> Wait time in hours (max. 596523).</p> <p>Minimum: 1S</p>						
REUSE-ADDRESS	YES   NO	O	z	u	w		b
	<p>YES The SSL port assigned to the broker can be taken over and assigned to other applications (this is the default value).</p> <p>NO The SSL port assigned to the broker cannot be taken over and assigned to other applications.</p> <p><b>Note:</b> This setting might be required at your site when restarting broker immediately after stopping it. This is due to the inherent latency of the TCP/IP stack when closing connections.</p>						
STACK-NAME	<i>name</i>	O	z	u	w		
	<p>Name of the TCP/IP stack that the broker is using.</p> <p>If not specified, broker will connect to the default TCP/IP stack running on the machine.</p>						
TRACE-LEVEL	0 - 4	O	z	u	w		b
	<p>The level of tracing to be performed while the broker is running with transport method SSL/TLS. It overrides the global value of trace level for all SSL/TLS routines.</p> <p>0 No tracing. Default value.</p> <p>1 Display IP address of incoming request, display error number of outgoing error responses.</p> <p>2 All of trace level 1, plus errors if request entries could not be allocated.</p> <p>3 All of trace level 2, plus all routines executed.</p> <p>4 All of trace level 3, plus function arguments and return values.</p> <p>Trace levels 2, 3 and 4 should be used only when requested by Software AG support.</p> <p>If you modify the TRACE-LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE-LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.</p>						
TRUST-STORE	<i>file name keyring</i>	R	z	u	w		b
	<p>Location of the store containing certificates of trust Certificate Authorities (or CAs).</p>						

Broker Attributes

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
	<p>z/OS Specify the RACF keyring using the following format: [ USER - ID / ] RING - NAME. If no value for USER - ID is provided, the keyring is assumed to be associated with the user ID that the broker kernel is running under.</p> <p>BS2000/Windows/UNIX Specify the file name of the CA certificate store. Examples: EXXCACERT.PEM, C:\Certs\ExxCACert.pem</p>						
VERIFY-CLIENT	<p><u>NO</u>   YES</p> <p>YES Additional client certificate required. NO No client certificate required (default).</p>	O	z	u	w		b

## DIV-specific Attributes

These attributes define a persistent store that is implemented as a VSAM linear data set (LDS) accessed using Data In Virtual (DIV). This DIV persistent store is a container for units of work. The DIV-specific attribute section begins with the keyword `DEFAULTS = DIV`. The attributes in this section are required if `PSTORE-TYPE = DIV` is specified.

**Note:** All attributes except the deprecated `DIV` were introduced with EntireX version 9.12. They replace the *Format Parameters* of earlier versions, which are deprecated but still supported for compatibility reasons.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
DIV	A511	O	z				
	The VSAM persistent store parameters, enclosed in double quotes (""). The value can span more than one line.						
	<b>Note:</b> Deprecated. This attribute is applicable only if you are supplying the persistent store parameters using <i>Format Parameters</i> of earlier versions. We recommend you use the attributes below that were introduced with EntireX 9.12 instead.						
DATASPACE - NAME	A8	O	z				
	Defines the name of the dataspace that will be used to map the persistent store.						
	Default value is DSPSTORE.						
DATASPACE - PAGES	126-524284	O	z				
	Defines the size of the dataspace used to map the persistent store (size=DATASPACE - PAGES * 4 KB). We recommend using the maximum value.						
	Default value is 2048.						
DDNAME	A8	R	z				
	Defines the JCL DDNAME that will be used to access the persistent store.						
STORE	A8	R	z				
	Defines an internal name that is used to identify the persistent store.						
TRACE - LEVEL	0 - 4	O	z				
	Trace level for DIV. It overrides the global value of trace level in the attribute file.						
	0 No tracing. Default value.						
	1 Log selected DIV SAVE calls taking longer than 2 seconds elapsed time.						

Attribute	Values	Opt/Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
	2 n/a 3 All of trace level 1, plus UOWID in use for the various DIV requests. 4 n/a  Trace levels 2, 3 and 4 should be used only when requested by Software AG support.  If you modify the TRACE-LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE-LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.						

## Adabas-specific Attributes

The Adabas-specific attribute section begins with the keyword `DEFAULTS = ADABAS`. The attributes in this section are required if `PSTORE-TYPE = ADABAS` is specified. In previous versions of EntireX, these Adabas-specific attributes and values were specified in the broker-specific `PSTORE-TYPE` attribute.

Attribute	Values	Opt/Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
BLKSIZE	126-20000	O	z	u	w	v	b
	Optional blocking factor used for message data. If not specified, broker will split the message data into 2 KB blocks to be stored in Adabas records. The maximum value depends on the physical device assigned to data storage. See the <i>Adabas</i> documentation.  For reasons of efficiency, do not specify a BLKSIZE much larger than the actual total size of the UOW data to be written. The total UOW size is the sum of all messages in the UOW plus 41 bytes of header information. This takes effect only after COLD start.  The BLKSIZE parameter applies only for a cold start of broker; subsequently the value of BLKSIZE is taken from the last cold start.  Default value is 2000.						
DBID	1 - 32535	R	z	u	w	v	b
	Database ID of Adabas database where the persistent store resides.						

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/SE	BS2000
FNR	1 - 32535	R	z	u	w	v	b
	File number of broker persistent store file.						
FORCE - COLD	<u>N</u>   Y	O	z	u	w	v	b
	Determines whether a broker cold start is permitted to overwrite a persistent store file that has been used by another broker ID and/or platform.  Specify Y to allow existing information to be overwritten.						
MAXSCAN	0-n	O	z	u	w	v	b
	Limits display of persistent UOW information in the persistent store through Command and Information Services.  Default value is 1000.						
OPENRQ	<u>N</u>   Y	O	z	u	w	v	b
	Determines whether driver for Adabas persistent store is to issue an OPEN command to Adabas.						
SVC	200-255	R	z			v	
	Use this parameter to specify the Adabas SVC number to be used by the Adabas persistent store driver.						
TRACE - LEVEL	0 - 4	O	z	u	w	v	b
	Trace level for Adabas persistent store. It overrides the global value of trace level in the attribute file.  0 No tracing. Default value. 1 Log selected Adabas CB fields (command code, response code, subcode, ISN, additions). 2 n/a 3 All of trace level 1, plus UOWID in use for the various Adabas requests and function entered/exit messages. 4 All of trace level 3, plus more Adabas CB fields for successful requests and returned function values.  Trace levels 2, 3 and 4 should be used only when requested by Software AG support.  If you modify the TRACE - LEVEL attribute, you must restart the broker for the change to take effect. For temporary changes to TRACE - LEVEL without a broker restart, use the EntireX Broker command-line utility ETBCMD.						

## Application Monitoring-specific Attributes

The application monitoring-specific attribute section begins with the keyword `DEFAULTS=APPLICATION-MONITORING`. It contains attributes that apply to the application monitoring functionality. At startup time, the attributes are read if the Broker-specific attribute `APPLICATION-MONITORING=YES` is specified. Duplicate or missing values are treated as errors. When an error occurs, application monitoring is turned off and EntireX Broker continues execution. See *Application Monitoring*.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VS	BS2000
APPLICATION-MONITORING-NAME or APPMON-NAME	A100	O	z	u	w	v	
	Specifies a default application monitoring name. Used to set the value of the <b>ApplicationName</b> KPI.						
COLLECTOR-BROKER-ID	A64	R	z	u	w	v	
	Identifies the Application Monitoring Data Collector. Has the format <i>host_name:port_number</i> , where <i>host_name</i> is the host where the Application Monitoring Data Collector is running and <i>port_number</i> is the port number of the Application Monitoring Data Collector. The default port is 57900.						
TRACE-LEVEL	0 - 4	O	z	u	w	v	
	<p>The level of tracing to be performed while the broker is running with application monitoring.</p> <p>0 No tracing. Default value.                      1 Display application monitoring errors.                      2 All of trace level 1, plus measuring points for application monitoring.                      3 All of trace level 2, plus function entered/exit messages with argument values and monitoring buffers.                      4 All of trace level 3, plus returned function values.</p> <p>Trace levels 2, 3 and 4 should be used only when requested by Software AG support.</p> <p>If you modify the <code>TRACE-LEVEL</code> attribute, you must restart the broker for the change to take effect. <code>TRACE-LEVEL</code> cannot be changed dynamically for application monitoring.</p>						

## Authorization Rule-specific Attributes

The authorization rule-specific attribute section begins with the keyword `DEFAULTS=AUTHORIZATION-RULES`. It contains attributes that enhance security-related definitions. At startup time, the attributes are read if the following conditions are met:

- Broker-specific attribute `SECURITY=YES`
- Security-specific attributes `SECURITY-SYSTEM=OS` and `SECURITY-LEVEL=AUTHORIZATION`

When an error occurs, the EntireX Broker stops. See *Authorization Rules*.

Attribute	Values	Opt/ Req	Operating System				
			z/OS	UNIX	Windows	z/VSE	BS2000
RULE-NAME	A32	R		u	w		
	Specifies a rule name. A rule is a container for a list of services and a list of client and server user IDs. All users defined in a rule are authorized to use all services defined in this rule. See example under <i>Rules Stored in Broker Attribute File</i> .						
CLASS SERVER SERVICE	A32	R		u	w		
	These three attributes together identify the service. CLASS must be specified first, followed immediately by SERVER and SERVICE. <i>Wildcard Service Definitions</i> under <i>Broker Attributes</i> are allowed.						
CLIENT-USER-ID	A32	R		u	w		
	Defines an authorized client user ID.						
SERVER-USER-ID	A32	R		u	w		
	Defines an authorized server user ID.						

## Variable Definition File

---

The broker attribute file contains the configuration of one EntireX Broker instance. In order to share attribute files between different brokers, you identify the attributes that are unique and move them to a variable definition file. This file enables you to share one attribute file among different brokers. Each broker in such a scenario requires its own variable definition file.

The following attributes are considered unique for each machine:

- BROKER- ID (in *Broker-specific Attributes*)
- NODE (in *Adabas SVC/Entire Net-Work-specific Attributes*)
- PORT (in *SSL/TLS-specific Attributes* and *TCP/IP-specific Attributes*)

How you use the variable definition file will depend upon your particular needs. For instance, some optional attributes may require uniqueness - for example, DBID and FNR in DEFAULTS=ADABAS - so that you may specify the persistent store.

# 6 Configuring Broker for Internationalization

---

- Configuring ICU Conversion ..... 84
- Building and Installing ICU Custom Converters ..... 86
- Writing Translation User Exits ..... 88
- Configuring Translation User Exits ..... 90
- Writing SAGTRPC User Exits ..... 91
- Configuring SAGTRPC User Exits ..... 96

Software internationalization is the process of designing products and services so that they can be adapted easily to a variety of different local languages and cultures. Internationalization within EntireX means internationalization of messages: the incoming and outgoing messages are converted to the desired codepage of the platform in use. This chapter explains in detail how to configure the broker for character conversion.

See also *Internationalization with EntireX*

## Configuring ICU Conversion

---

### > To configure ICU conversion

1 In the Broker attribute file, set the service-specific attribute `CONVERSION`. Examples:

- ICU Conversion with SAGTCHA for *ACI-based Programming*:

```
CONVERSION=(SAGTCHA,OPTION=SUBSTITUTE)
```

- ICU Conversion with SAGTRPC for *RPC-based Components and Reliable RPC*:

```
CONVERSION=(SAGTRPC,OPTION=STOP)
```

2 Optionally configure a `CONVERSION OPTION` to tune error behavior to meet your requirements; see *OPTION Values for Conversion*.

3 For the Broker attribute, check if ICU conversion is possible, that is, the attribute `ICU-CONVERSION` is either

- not defined, its default is YES
- set to YES

### > To configure locale string defaults (optional)

- If the broker's locale string defaults do not match your requirements (see *Broker's Locale String Defaults*), we recommend you assign suitable locale string defaults for your country and region, see the respective attribute in *Codepage-specific Attributes* for how to customize the broker's locale string defaults.

➤ **To customize mapping of locale strings (optional)**

- If the built-in locale string mapping mechanism does not match your requirements, you can assign specific codepages to locale strings. See *Broker's Built-in Locale String Mapping* and `locale-string` for information on customizing the mapping of locale strings to codepages.

## Building and Installing ICU Custom Converters

---

User-written ICU custom-converters can be used for *ACI-based Programming*, *RPC-based Components*, and *Reliable RPC*. This section covers the following topics:

- [Writing a User-written ICU Converter](#)
- [Compiling a User-written ICU Converter](#)
- [Installing a User-written ICU Converter](#)

### Writing a User-written ICU Converter

ICU uses algorithmic conversion, non-algorithmic conversion and combinations of both. See *ICU Conversion*. Non-algorithmic converters defined by the UCM format are the easiest way to define user-written ICU converters. See *UCM Format*.

#### > To write a (non-algorithmic) user-written ICU converter

- Define the ICU converter file in UCM format using a text editor to meet your requirements.

**Note:** For further explanation of the UCM file format, see *ICU Resources*.

Writing algorithmic and partially algorithmic converters can be complex. However, they can be installed into EntireX in the same way as the table-driven, non-algorithmic ones. A description of how to write algorithmic and partially algorithmic converters is beyond the scope of this documentation; please see the ICU documentation and other sources specified under *ICU Resources*.

### Compiling a User-written ICU Converter

#### > To compile the user-written ICU converter

- Compile the converter source files (extension *.ucm*) into binary converter files (extension *.cnv*) using the ICU tool `makeconv`. Example:

```
makeconv -v myebcdic.ucm
```

**Note:** EntireX delivers the ICU tool `makeconv` in the EntireX *bin* folder.

This produces a binary converter file named *myebcdic.cnv*.

**Caution:** The binary format "cnv" depends on the endianness (big/little-endian) and character set family (ASCII/EBCDIC) of the computer where it is produced. Under Windows, little-endian ASCII binary converter files are produced. If the broker is

running under Windows, it is highly recommended to compile the converter source file(s) under Windows also, otherwise unpredictable result may occur.

## Installing a User-written ICU Converter

### > To install the user-written ICU converter

- 1 Define the broker attribute `ICU-DATA-DIRECTORY`. See *Broker-specific Attributes*.

Example:

```
ICU_DATA_DIRECTORY="...\EntireX\config\etb"
```

- 2 Define the folder `icudt<icu-version>l` within the `ICU-DATA-DIRECTORY`.

where `<icu-version>` is the ICU version used, for example 54, and  
`l` stands for little-endian

Example:

```
...\EntireX\config\etb\icudt54l
```

#### Notes:

1. The subfolder and its naming are given by ICU standard. It is not invented by Software AG.
  2. See the Release Notes to determine the ICU version used by the broker you are running and form the correct folder name - otherwise the user-written ICU converter will not be located.
  3. There are also other approaches supported by ICU to locate converters. These approaches are (also) ICU version dependent. However, Software AG recommends the mechanism described above. See the ICU website for more information under *ICU Resources*.
- 3 Copy the user-written ICU converter binary file (extension ".cnv") to the folder referenced by `ICU-DATA-DIRECTORY` and its subfolder defined under steps 1 and 2 above. Examples:

```
...\EntireX\config\etb\icudt541\myebcdic.cnv  
...\EntireX\config\etb\icudt541\myascii.cnv
```

- 4 If the converter name is not sent as the locale string by your application, customize the mapping of locale strings by assigning the user-written ICU converter (codepage) to locale strings in the Broker attribute file, see `locale-string` for how to customize the mapping of locale strings to codepages. Example:

```
DEFAULTS=CODEPAGE  
/* Customer-written ICU converter */  
CP1140=myebcdic  
CP0819=myascii
```

- 5 For the Broker attribute, check whether ICU conversion is possible, that is, the attribute `ICU-CONVERSION` is not defined (default=YES) or set to YES.
- 6 For the Broker attribute, check whether use of ICU custom converters is possible, that is, the attribute `ICU-SET-DATA-DIRECTORY` is not defined (default=YES) or set to YES.

## Writing Translation User Exits

---

This section covers the following topics:

- [Introduction](#)
- [Structure of the TRAP Control Block](#)
- [Using the TRAP Fields](#)

### Introduction

EntireX Broker provides an interface to enable user-written translation routines in the programming language C. It contains three parameters:

- The address of the TRAP control block (TRAP = Translation Routine / Area for Parameters).
- The address of a temporary work area. It is aligned to fullword / long integer boundary (divisible by 4). The work area can only be used for temporary needs and is cleared after return.
- A fullword (long integer) that contains the length of the work area.

**Note:** Names for user-written translation routines starting with "SAG" are reserved for Software AG usage and must not be used, e.g. "SAGTCHA" and "SAGTRPC".

## Structure of the TRAP Control Block

The C structure `TR_TRAP` covers the layout of the control block.

```
typedef struct _TR_TRAP /* I / O */
{
    unsigned long tr_type; /* TRAP type: TRAP_TYPE inp */
#define TR_TYPE 2 /* TRAP type ETB 121 */
    long tr_ilen; /* Input buffer length inp */
    unsigned char *tr_ibuf; /* Ptr to input buffer inp */
    long tr_olen; /* Output buffer length inp */
    unsigned char *tr_obuf; /* Ptr to output buffer inp */
    long tr_dlen; /* Len of data returned: out */
    /* Minimum of tr_ilen */
    /* and tr_olen */
    unsigned long tr_shost; /* Senders host inp */
#define TR_LITTLE_ENDIAN 0 /* little endian */
#define TR_BIG_ENDIAN 1 /* big endian */
    unsigned long tr_scode; /* Senders character set inp */
#define SEBCIBM ((1L << 5)|(1L << 1)) /* 0x22 EBCDIC (IBM) */
#define SEBCSNI ((1L << 6)|(1L << 1)) /* 0x42 EBCDIC (SNI) */
#define SA88591 (1L << 7) /* 0x80 ASCII */
    unsigned long tr_rhost; /* Receivers host (see tr_shost) inp */
    unsigned long tr_rcode; /* Receivers char set (see tr_scode) inp */
    unsigned long tr_bhost; /* BROKER host (see tr_shost) inp */
    unsigned long tr_bcode; /* BROKER char set (see tr_scode) inp */
    unsigned long tr_senva; /* Senders ENVIRONMENT field set: inp */
#define OFF 0 /* ENVIRONMENT field not set */
#define ON 1 /* ENVIRONMENT field set */
    unsigned long tr_renva; /* Receivers ENVIRONMENT field set: inp */
    /* see tr_senva */
#define S_ENV 32 /* size of ENVIRONMENT field */
    char tr_senv[S_ENV]; /* Senders ENVIRONMENT field inp */
    char tr_renv[S_ENV]; /* Receivers ENVIRONMENT field inp */
} TR_TRAP;
```

### Using the TRAP Fields

The `tr_dlen` must be supplied by the user-written translation routine. It tells the Broker the length of the message of the translation. In our example its value is set to the minimum length of the input and output buffer.

All other TRAP fields are supplied by the Broker and must not be modified by the user-written translation routine.

The incoming message is located in a buffer pointed to by `tr_ibuf`. The length (not to be exceeded) is supplied in `tr_ilen`. The character set information from the send buffer can be taken from `tr_scode`.

The outgoing message must be written to the buffer pointed to by `tr_obuf`. The length of the output buffer is given in the field `tr_olen`. The character set is specified in `tr_rcode`. If the addresses given in `tr_ibuf` and `tr_obuf` point to the same location, it is not necessary to copy the data from the input buffer to the output buffer.

The environment fields `tr_senva` and `tr_renva` are provided to handle site-dependent character set information. For the `SEND` and/or `RECEIVE` functions, you can specify data in the `ENVIRONMENT` field of the Broker ACI control block. This data is translated into the codepage of the platform where EntireX Broker is running (see field `tr_bcode`) and is available to the `tr_senv` or `tr_renv` field in the TRAP control block. `tr_senva` or `tr_renva` are set to `ON` if environmental data is available. Any values given in the API field `ENVIRONMENT` must correspond to the values handled in the translation routine.

## Configuring Translation User Exits

---

### ➤ To configure translation user exits

As a prerequisite, the user-written translation routine DLL must be accessible to the Broker worker threads.

- 1 Copy the user-written translation routine DLL into the EntireX *bin* folder.
- 2 In the Broker attribute file, set the service-specific attribute `TRANSLATION` to the name of the user-written translation routine. Example:

```
TRANSLATION=MYTRANS
```

or

1. Place the user-written translation routine DLL in a folder of your choice. Spaces in the path name are not allowed.
2. In the Broker attribute file, set the service-specific attribute `TRANSLATION` to the full path name of the folder of the user-written translation routine. Example:

```
TRANSLATION="C:\MyDir\MyTrans\MyTrans.dll"
```

## Writing SAGTRPC User Exits

This section covers the following topics:

- [Introduction](#)
- [Structure of the User Exit Control Block](#)
- [Using the User Exit Interface Fields](#)
- [Character Set and Codepage](#)

### Introduction

EntireX Broker provides an interface to SAGTRPC user exit routines written in the programming language C. The interface contains three parameters:

- The address of the UE (user exit) control block.
- The address of a temporary work area. It is aligned to a fullword / long-integer boundary (divisible by 4). The work area can only be used temporarily and is cleared after return.
- A fullword (long integer) that contains the length of the work area.

**Note:** Names for conversion routines starting with "SAG" are reserved for Software AG usage and must not be used, e.g. "SAGTCHA" and "SAGTRPC".

### Structure of the User Exit Control Block

The C structure UECEB shows the layout of the user exit control block.

```
typedef struct _UECB
{
    unsigned long    eVersion;
#define USRTRPC_VERSION_1          1

    char            * pInputBuffer;
    unsigned long   uInputLen;
    char            * pOutputBuffer;
    unsigned long   uOutputLen;
    unsigned long   uReturnedLen;

    unsigned long   shost;
#define USRTRPC_LITTLE_ENDIAN 0    /* little endian */
#define USRTRPC_BIG_ENDIAN   1    /* big endian */

    unsigned long   scode;
#define USRTRPC_SEBCIBM ((1L << 5)|(1L << 1)) /* 0x22 EBCDIC (IBM) */
#define USRTRPC_SEBCSNI ((1L << 6)|(1L << 1)) /* 0x42 EBCDIC (SNI) */
#define USRTRPC_SA88591   (1L << 7) /* 0x80 ASCII */
}
```

```

    unsigned long        rhost;
/* see shost */
    unsigned long        rcode;
/* see scode */
    unsigned long        bhost;
/* see shost */
    unsigned long        bcode;
/* see scode */

    unsigned long        uCpSender;
    unsigned long        uCpReceiver;
    unsigned long        uCpBroker;

    char                  eFunction;
#define USRTRPC_FCT_CONVERT        'C'
#define USRTRPC_FCT_GETLENGTH     'L'

    char                  eDirection;
#define USRTRPC_DIR_SENDER_TO_BROKER    '1'
#define USRTRPC_DIR_SENDER_TO_RECEIVER  '2'
#define USRTRPC_DIR_BROKER_TO_RECEIVER  '3'

    char                  sFormat[2];
#define ERX_USERDATA        "01"    /* UserId, Lib, Pgm, etc. from Header
                                     (truncatable) */
#define ERX_METADATA        "02"    /* Header Data (non-truncatable) */
#define ERX_FRMTDATA        "03"    /* Format Buffer (non-truncatable) */
#define ERX_SB_ELEMENT      "04"    /* String Buffer */
#define ERX_VB_METADATA    "05"    /* Value Buffer Array Occurences,
                                     String Length */
#define ERX_PREVIEW        "99"    /* Previewing FB and VB, etc...
                                     /* Convert data lazy. Do not care on
                                     /* length changes and truncation.

#define ERX_FRMT_A          "A "    /* Data Type A
#define ERX_FRMT_AV        "AV"    /* Data Type AV
#define ERX_FRMT_B          "B "    /* Data Type B
#define ERX_FRMT_BV        "BV"    /* Data Type BV
#define ERX_FRMT_D          "D "    /* Data Type D
#define ERX_FRMT_F4        "F4"    /* Data Type F4
#define ERX_FRMT_F8        "F8"    /* Data Type F8
#define ERX_FRMT_I1        "I1"    /* Data Type I1
#define ERX_FRMT_I2        "I2"    /* Data Type I2
#define ERX_FRMT_I4        "I4"    /* Data Type I4
#define ERX_FRMT_K          "K "    /* Data Type K
#define ERX_FRMT_KV        "KV"    /* Data Type KV
#define ERX_FRMT_L          "L "    /* Data Type L
#define ERX_FRMT_N          "N "    /* Data Type N
#define ERX_FRMT_P          "P "    /* Data Type P
#define ERX_FRMT_T          "T "    /* Data Type T
#define ERX_FRMT_U          "U "    /* Data Type U
#define ERX_FRMT_UV        "UV"    /* Data Type UV

```

```

char          szErrorText[40];
} UECB;

```

The file *usrtrpc.c* is an example of the SAGTRPC user exit. It is delivered in the Broker user exit directory. See *Directories as Used in EntireX*.

## Using the User Exit Interface Fields

The user exit provides two separate functions, `Convert` and `GetLength`. The field `eFunction` indicates the function to execute.

### Errors

Both functions can send an error, using register 15 in the range 1 to 9999 to SAGTRPC together with an error text in the field `szErrorText`.

- A value of 0 returned in register 15 means successful response.
- Error 9999 is reserved for output buffer overflow. See [Convert Function](#).
- When an error occurs, the conversion of the message will be aborted and the error text will be sent to the receiver (client or server). The error is prefixed with the error class 1011. See *Message Class 1011 - User-definable SAGTRPC Conversion Exit*.

Example:

The user exit returns 1 in register 15 and the message “Invalid Function” in `szErrorText`. The receiver gets the error message 10110001 Invalid Function.

### Convert Function

This function has to be executed when the contents of `eFunction` match the definition `USRTRPC_FCT_CONVERT`.

`uReturnedLen` must be supplied by SAGTRPC's user-written conversion exit. Its value must be set to the length of the output buffer.

All other interface fields are supplied by the Broker and must not be modified by SAGTRPC's user-written conversion exit.

The incoming data is located in a buffer pointed to by `pInputBuffer`. `uInputLen` defines the length.

The outgoing converted message must be written to the buffer pointed to by `pOutputBuffer`. The field `tr_olen` defines the maximum length available.

For variable length data such as AV and KV, an output buffer overflow can occur if the message size increases after conversion or the receiver's receive buffer is too small. In this case error 9999

“output buffer overflow” must be returned, which calls the *GetLength Function* for the remaining fields.

### GetLength Function

The `GetLength` function evaluates the needed length of the output buffer after conversion. An actual conversion must not be performed. The length needed must be returned in the field `uOutputLen`.

The `GetLength` function is called for remaining fields after the `Convert` function returned the error 9999 “output buffer overflow”.

The purpose of this function is to evaluate the length needed by the receiver's receive buffer. This length is returned to the receiver in the ACI field `RETURN-LENGTH`. The receiver can then use the Broker ACI function `RECEIVE` with the option `LAST` together with a receive buffer large enough to reread the message.

### Character Set and Codepage

The character-set information used is the same as in the user-written translation routine and is taken from `scode` (for the sender), `rcode` (for the receiver) and `bcode` (for the Broker). The character-set information depends on the direction information given in the field `eDirection`. See the following table:

<code>eDirection</code>	From Character Set	To Character Set
<code>USRTRPC_DIR_SENDER_TO_BROKER</code>	<code>scode</code>	<code>bcode</code>
<code>USRTRPC_DIR_SENDER_TO_RECEIVER</code>	<code>scode</code>	<code>rcode</code>
<code>USRTRPC_DIR_BROKER_TO_RECEIVER</code>	<code>bcode</code>	<code>rcode</code>

Alternatively, the codepage as derived from the locale string mapping process is provided in `uCpSender` (sender codepage), `uCpReceiver` (receiver codepage) and `uCpBroker` (Broker codepage), and can be used to find the correct conversion table. See the following table and also *Locale String Mapping*.

<code>eDirection</code>	From Codepage	To Codepage
<code>USRTRPC_DIR_SENDER_TO_BROKER</code>	<code>uCpSender</code>	<code>uCpBroker</code>
<code>USRTRPC_DIR_SENDER_TO_RECEIVER</code>	<code>uCpSender</code>	<code>uCpReceiver</code>
<code>USRTRPC_DIR_BROKER_TO_RECEIVER</code>	<code>uCpBroker</code>	<code>uCpReceiver</code>

4. If the contents are truncated, character boundaries are the responsibility of the user exit. Complete valid characters after conversion have to be guaranteed. This may be a complex task for codepages described under *Arabic Shaping*, *EBCDIC Stateful Codepages* or *Multibyte or Double-byte Codepages*. For single-byte codepages it is simple because the character boundaries are the same as the byte boundaries.
5. The field length can decrease or increase during the conversion up to the output buffer length. The new field length must be returned in `uReturnedLen`. If the output buffer in the `Convert` function is too small, error 9999 must be returned to the caller.
6. The field buffer should continue to be converted until the output buffer is full or the input buffer has been processed. If the field content length increases or truncations occur, no error should be produced. If the field content length decreases, there should be no padding. The new field length should simply be returned to the caller.
7. Codepages used for RPC data streams must meet several requirements. See *Codepage Requirements for RPC Data Stream Conversions*. If these are not met, the codepage cannot be used to convert RPC data streams.

➤ **To compile and link the SAGTRPC user exit**

- See the *README.TXT* in the *Broker User Exit Directory*.

## Configuring SAGTRPC User Exits

---

The user-written SAGTRPC user exit DLL must be accessible to the Broker worker threads.

➤ **To configure SAGTRPC user exits**

- 1 Copy the user-written SAGTRPC user exit DLL into the *EntireX bin* folder.
- 2 In the Broker attribute file, set the service-specific attribute `CONVERSION` to the name of your SAGTRPC user exit. Example:

```
CONVERSION=(MYRPC)
```

or

1. Place the user-written translation routine DLL in a folder of your choice. Spaces in the path name are not allowed.
2. In the Broker attribute file, set the service-specific attribute `CONVERSION` to the full path name of the folder of the SAGTRPC user exit. Example:

```
CONVERSION="C:\MyDir\MyTrans\MyRpc.dll"
```

➤ **To configure locale string defaults**

- If the broker's locale string defaults do not match your requirements, we recommend you assign suitable locale string defaults for your country and region. See the appropriate attribute under *Codepage-specific Attributes* for information on customizing broker's locale string defaults, and also *Locale String Mapping*.

➤ **To customize mapping of locale strings**

- If the broker's built-in locale string mechanism does not match your requirements, you can assign specific codepages to locale strings. See *Broker's Built-in Locale String Mapping* and the appropriate attribute under *Codepage-specific Attributes* for information on customizing broker's locale string defaults.

# 7 Managing the Broker Persistent Store

---

- Implementing an Adabas Database as Persistent Store ..... 100
- c-tree Database as Persistent Store ..... 107
- Migrating the Persistent Store ..... 108

The persistent store is used for storing unit-of-work messages to disk. This means message and status information can be recovered after a hardware or software failure to the previous commit point issued by each application component.

Under Windows, the broker persistent store can be implemented with:

- the Adabas database of Software AG
- the c-tree (C) Copyright database of FairCom Corporation (R)

**Note:** If you were previously using the local file system of the machine where the Broker kernel executes, you will need to migrate to a supported persistent store. This persistent store option is no longer supported. To migrate your persistent store, please see the steps outlined in [Migrating the Persistent Store](#).

See also *Concepts of Persistent Messaging*.

## Implementing an Adabas Database as Persistent Store

---

- [Introduction](#)
- [Adabas Persistent Store Parameters](#)
- [Configuring and Operating the Adabas Persistent Store](#)
- [Adabas DBA Considerations](#)

### Introduction

EntireX provides an Adabas persistent driver. This enables Broker unit of work (UOW) messages and their status to be stored in an Adabas file. It is designed to work with Adabas databases under z/OS, UNIX, Windows, BS2000 and z/VSE, and can be used where the database resides on a different machine to Broker kernel. For performance reasons, we recommend using EntireX Broker on the same machine as the Adabas database.

### Adabas Persistent Store Parameters

Parameters are supplied using the *Adabas-specific Attributes* in the platform-independent administration documentation. See excerpt from the attribute file:

```
DEFAULTS=BROKER
STORE                = BROKER
PSTORE - TYPE       = ADABAS
PSTORE              = COLD

DEFAULTS=ADABAS
DBID                 = dbid
FNR                  = fnr
```

## Configuring and Operating the Adabas Persistent Store

### Selecting the Adabas Persistent Store Driver

The Adabas Persistent Store driver module is contained within the regular Broker load library or binaries directory. The module ADAPSI is activated by specifying the `PSTORE-TYPE` parameter as shown above.

Use the supplied script `persistence.fdu.bat` in the `bin` directory to create a persistent store file in your Adabas database. This script uses the Adabas FDT definition found in file `persistence.fdt` in the `etc` directory.

The script `persistence.fdu.bat` can be executed like this:

```
persistence.fdu.bat <dbid> <fnr>
```

**Note:** You can customize the supplied script and FDT file in accordance with your site requirements. See the *Adabas Utilities* manual where necessary, specifically *ADAFDU (File Definition Utility)*.

#### > To run the bat file

- 1 Ensure that you execute the bat file on the same machine that the target Adabas is running on. (The database can be either active or inactive at the time you execute it.)
- 2 Ensure that Adabas environment variables (such as `ACLDIR`, `ADATTOOLS`, `ADABIN` and `ADALNK`) are set up.
- 3 Set your working directory to the one where the bat and fdt files are located.
- 4 Execute the bat file, passing it two parameters. (The first one is the DBID, where persistent store file is to be created; the second is the file number.)
- 5 Option: If the DBID is less than 3 characters long, include leading zeros. For example:

```
persistence.fdu.bat 001 19
```

Result: Creation of file number 19 in database 1.

### Defining an Adabas FDT for EntireX File

```
ADACMP FNDEF='01,WK,21,A,DE '
ADACMP FNDEF='01,WJ,126,B,MU '
ADACMP FNDEF='01,WI,126,B,DE,NU '
ADACMP FNDEF='01,WL,96,A,DE,NU '
ADACMP FNDEF='01,WP,96,A,DE,NU '
```

### Restrictions

If a HOT start is performed, the Broker kernel must be executed on the same platform on which also the previous Broker executed. This is because some portions of the persistent data are stored in the native character set and format of the Broker kernel. It is also necessary to start Broker with the same Broker ID as the previous Broker executed.

If a COLD start is executed, a check is made to ensure the Broker ID and platform information found in the persistent store file is consistent with the Broker being started (provided the persistent store file is not empty). This is done to prevent accidental deletion of data in the persistent store by a different Broker ID. If you intend to COLD start Broker and to utilize a persistent store file which has been used previously by a different Broker ID, you must supply the additional `PSTORE-TYPE` parameter `FORCE-COLD=Y`.

### Recommendations

- Perform regular backup operations on your Adabas database. The persistent store driver writes C1 checkpoint records at each start up and shut down of Broker.
- For performance reasons, execute Broker on the same machine as Adabas.

### Broker Checkpoints in Adabas

During startup, Broker writes the following C1 checkpoint records to the Adabas database. The time, date and job name are recorded in the Adabas checkpoint log. This enables Adabas protection logs to be coordinated with Broker executions. This information can be read from Adabas, using the `ADAREP` utility with option `CPLIST`:

Broker Execution Name	Broker Execution Type	Adabas
ETBC	Broker Cold Start	Normal Cold Start
ETBH	Broker Hot Start	Normal Hot Start
ETBT	Broker Termination	Normal Termination

## Adabas DBA Considerations

- [BLKSIZE : Adabas Persistent Store Parameter for Broker](#)
- [Table of Adabas Parameter Settings](#)

### BLKSIZE : Adabas Persistent Store Parameter for Broker

Caution should be exercised when defining the block size (BLKSIZE) parameter for the Adabas persistent store. This determines how much UOW message data can be stored within a single Adabas record. Therefore, do not define a much larger block size than the size of the maximum unit of work being processed by Broker. (Remember to add 41 bytes for each message in the unit of work.) The advantage of having a good fit between the unit of work and the block size is that fewer records are required for each I/O operation.

It is necessary to consider the following Adabas parameters and settings when using Adabas for the persistent store file:

#### Table of Adabas Parameter Settings

Topic	Description
Allowing Sufficient Adabas UQ Elements	<p>Allow sufficient Adabas user queue (UQ) elements each time you start Broker. The Broker utilizes a number of user queue elements equal to the number of worker tasks (NUM-WORKER), plus two. Adabas timeout parameter (TNAE) determines how long the user queue elements will remain. This can be important if Broker is restarted after an abnormal termination, and provision must be made for sufficient user queue elements in the event of restarting Broker.</p> <p>Use either the Adabas utility ADAOPR or the Adabas DBA workbench to clean-up any user queue element belonging to the previous Broker job.</p>
Setting Size of Hold Queue Parameters	<p>Consideration must be given to the Adabas hold queue parameters NISNHQ and NH. These must be sufficiently large to allow Adabas to add/update/delete the actual number of records within a single unit of work.</p> <p>Example: where there are 100 message within a unit of work and the average message size is 10,000 bytes, the total unit of work size is 1 MB. If, for example, a 2 KB block size (default BLKSIZE=2000) is utilized by the Adabas persistent store driver, there will be 500 distinct records within a single Adabas commit (ET) operation, and provision must be made for this to occur successfully.</p>
Setting Adabas TT Parameter	<p>Consideration must be given to the Adabas transaction time (TT) parameter for cases where a large number of records is being updated within a single unit of work.</p>

Topic	Description
Defining LWP Size	Sufficient logical work pool (LWP) size must be defined so that the Adabas persistent store can update and commit the units of work. Adabas must be able to accommodate this in addition to any other processing for which it is used.
Executing Broker Kernel and Adabas Nucleus on Separate Machines	If Broker kernel is executed on a separate machine to the Adabas nucleus, with a different architecture and codepage, then we recommend running the Adabas nucleus with the UEC (universal conversion) option in order to ensure that Adabas C1 checkpoints are legible within the Adabas checkpoint log.
Setting INDEXCOMPRESSION=YES	This Adabas option can be applied to the Adabas file to reduce by approximately 50% the amount of space consumed in the indexes.
4-byte ISNs	If you anticipate having more than 16 million records within the persistent store file, you must use 4-byte ISNs when defining the Adabas file for EntireX.
Specification of Adabas LP Parameter	<p><b>Caution:</b> This parameter must be specified large enough to allow the largest UOW to be stored in Adabas.</p> <p>If this is not large enough, Broker will detect an error (response 9; subresponse - 4 bytes - X'0003',C'LP') and Broker will not be able to write any further UOWs.</p> <p>See the description of the LP parameter under <i>ADARUN Parameters</i> in the <i>DBA Reference Summary</i> of the Adabas documentation.</p>

### Estimating the Number of Records to be Stored

To calculate the Adabas file size it is necessary to estimate the number of records being stored. As an approximate guide, there will be one Adabas record (500 bytes) for each unprocessed unit of work, plus also *n* records containing the actual message data, which depends on the logical block size and the size of the unit of work. In addition, there will be one single record (500 bytes) for each unit of work having a persisted status.

Always allow ample space for the Adabas persistent store file since the continuous operation of Broker relies of the availability of this file to store and retrieve information.

**Note:** If the Adabas file space is exceeded, Broker will automatically terminate, and it will be necessary either to increase the space available to the file using Adabas utilities or to perform a Broker HOT start with `NEW-UOW-MESSAGES=NO` to allow units of work to be consumed before normal operation can continue.

### Estimating the Number of Records to be Stored

In this example there are 100,000 Active UOW records at any one time. Each of these is associated with two message records containing the message data. UOW records are 500 bytes in length. Each message record contains 2,000 bytes. In addition, there are 500,000 UOW status records residing in the persistent store, for which the UOW has already been completely processed. These are 500 bytes long.

**Note:** The actual size of the data stored within the UOW message records is the sum of all the messages within the UOW, plus a 41-byte header for each message. Therefore, if the average message length is 59 bytes, the two 2,000 bytes, messages records, could contain  $n = 4,000 / (59+41)$ , or 40 messages. Adabas is assumed to compress the message data by 50% in the example (this can vary according to the nature of the message data).

3-byte ISNs and RABNs are assumed in this example. A device type of 8393 is used; therefore, the ASSO block size is 4,096, and DATA block size is 27,644. Padding factor of 10% is specified.

The following example calculates the space needed for Normal Index (NI), Upper Index (UI), Address Converter (AC) and Data Storage (DS).

Calculation Factors	Required Space
<ul style="list-style-type: none"> <li>■ Number entries for descriptor WK (21-byte unique key)</li> </ul>	<ul style="list-style-type: none"> <li>■ = number UOW records: 0.1 + 0.5 million</li> <li>+ number message records: 0.2 million</li> </ul>
<ul style="list-style-type: none"> <li>■ NI Space for descriptor WK</li> <li>■ (3-byte ISN )</li> <li>■ (4,092 ASSO block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>800,000 * (3 + 21 + 2)</math></li> <li>■ = 20,800,000 bytes</li> <li>■ = 5,648 blocks</li> </ul>
<ul style="list-style-type: none"> <li>■ UI Space for descriptor WK</li> <li>■ (3-byte ISN + 3-byte RABN)</li> <li>■ (4,092 ASSO block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>5,648 * (21 + 3 + 3 + 1)</math></li> <li>■ = 158,140 bytes</li> <li>■ = 43 blocks</li> </ul>
<ul style="list-style-type: none"> <li>■ Number entries for descriptor WI (8-byte unique key)</li> </ul>	<ul style="list-style-type: none"> <li>■ = number processed UOW records: 0.5 million</li> </ul>
<ul style="list-style-type: none"> <li>■ NI Space for descriptor WI</li> <li>■ (3-byte ISN)</li> <li>■ (4,092 ASSO block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>500,000 * (3 + 8 + 2)</math></li> <li>■ = 6,500,000 bytes</li> <li>■ = 1,765 blocks</li> </ul>
<ul style="list-style-type: none"> <li>■ UI Space for descriptor WI</li> <li>■ (3-byte ISN and 3 byte RABN)</li> <li>■ (4,092 ASSO block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>17,649 * (8 + 3 + 3 + 1)</math></li> <li>■ = 26,475 bytes</li> <li>■ = 8 blocks</li> </ul>

Calculation Factors	Required Space
<ul style="list-style-type: none"> <li>■ Number entries for descriptor WL (96 byte key)</li> </ul>	<ul style="list-style-type: none"> <li>■ = number UOW records 0.1 + 0.5 million</li> </ul>
<ul style="list-style-type: none"> <li>■ NI Space for descriptor WL</li> <li>■ (3-byte ISN)</li> <li>■ (4,092 ASSO block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>600,000 * (3 + 96 + 2)</math></li> <li>■ = 60,600,000 bytes</li> <li>■ = 16,455 blocks</li> </ul>
<ul style="list-style-type: none"> <li>■ UI Space for descriptor WL</li> <li>■ (3-byte ISN and 3 byte RABN)</li> <li>■ (4,092 ASSO block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>164,548 * (96 + 3 + 3 + 1)</math></li> <li>■ = 16,948,517 bytes</li> <li>■ = 461 blocks</li> </ul>
<ul style="list-style-type: none"> <li>■ Address Converter space</li> <li>■ (4,092 ASSO block)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>(800,000 + 1) * 3 / 4092</math></li> <li>■ = 587 blocks</li> </ul>
<ul style="list-style-type: none"> <li>■ Data storage for message data (2,000-byte records compressed by 50%)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>0.2 \text{ million} * 2000 * 0.5 = 200,000,000 \text{ bytes}</math></li> </ul>
<ul style="list-style-type: none"> <li>■ Data storage for UOW data (2,000-byte records compressed by 50%)</li> </ul>	<ul style="list-style-type: none"> <li>■ = <math>0.6 \text{ million} * 500 * 0.5 = 150,000,000 \text{ byte}</math></li> </ul>
<ul style="list-style-type: none"> <li>■ Combined space required for data (27,644 DATA block 10% padding)</li> </ul>	<ul style="list-style-type: none"> <li>■ = 14,068 blocks</li> </ul>
Entity Requiring Space	Total Required Space
Normal Index (NI)	= 23,868 blocks
Upper Index (UI)	= 512 blocks
Data Storage (DS)	= 14,068 blocks
Address Converter (AC)	= 587 blocks

**Tips on Transports, Platforms and Versions**

■ **Entire Net-Work**

If you intend to use Adabas persistent store through Entire Net-Work, see the Entire Net-Work documentation for installation and configuration details.

■ **Adabas Versions**

Adabas persistent store can be used on all Adabas versions currently released and supported by Software AG.

**■ Prerequisite Versions of Entire Net-Work with Adabas**

See the Adabas and Entire Net-Work documentation to determine prerequisite versions of Entire Net-Work to use with Adabas at your site.

**Copying the Persistent Store from/to another Adabas File or Database**

The DBA can perform an UNLOAD of the Adabas file in which the persistent store is located (this must be done when Broker is not running). This allows the persistent store to be LOADED into another Adabas file, in the same or in another Adabas database. Broker can then be restarted (PSTORE=HOT) with the attributes specifying the new location of the persistent store file. See [Table of Adabas Parameter Settings](#) above. See separate Adabas documentation for details of Adabas utilities for UNLOAD and LOAD operations.

The persistent store file can only be reloaded into another Adabas database running on the same platform type as the Adabas database from which it was unloaded.

## c-tree Database as Persistent Store

---

EntireX provides a c-tree© persistent driver based on the c-tree© User API of the FairCom Corporation®. This driver manages a fast and reliable embedded local database.

In order to operate EntireX using the c-tree persistent store option, you must assign Broker attribute PSTORE-TYPE=CTREE. No other attributes are required. However, several attributes are supported to set additional optional attributes for the c-tree store. See *c-tree-specific Attributes* for details.

## Migrating the Persistent Store

---

The contents of EntireX Broker's persistent store can be migrated to a new persistent store in order to change the PSTORE type or to use the same type of PSTORE with increased capacity.

The migration procedure outlined here requires two Broker instances started with a special `RUN-MODE` parameter. One Broker unloads the contents of the persistent store and transmits the data to the other Broker, which loads data into the new PSTORE. Therefore, for the purposes of this discussion, we will refer to an *unload* Broker and a *load* Broker.

This procedure is based on Broker-to-Broker communication to establish a communication link between two Broker instances. It does not use any conversion facilities, since the migration procedure is supported for homogeneous platforms only.

- [Configuration](#)
- [Migration Procedure](#)

### Configuration

The migration procedure requires two Broker instances started with the `RUN-MODE` parameter. The unload Broker should be started with the following attribute:

```
RUN-MODE=PSTORE-UNLOAD
```

The load Broker should be started with the following attribute:

```
RUN-MODE=PSTORE-LOAD
```

These commands instruct the Broker instances to perform the PSTORE migration.

**Note:** The attribute `PARTNER-CLUSTER-ADDRESS` must be defined in both Broker instances to specify the transport address of the load Broker. The unload Broker must know the address of the load broker, and the load Broker must in turn know the address of the unload Broker.

### Example:

Broker ETB001 performs the unload on host HOST1, and Broker ETB002 performs the load on host HOST2. The transmission is based on TCP/IP. Therefore, Broker ETB001 starts the TCP/IP communicator to establish port 1971, and Broker ETB002 starts the TCP/IP communicator to establish port 1972.

For ETB001, attribute `PARTNER-CLUSTER-ADDRESS=HOST2:1972:TCP` is set, and for ETB002, attribute `PARTNER-CLUSTER-ADDRESS=HOST1:1971:TCP` is set to establish the Broker-to-Broker communication between the two Broker instances.

In addition to attributes `RUN-MODE` and `PARTNER-CLUSTER-ADDRESS`, a fully functioning Broker configuration is required when starting the two Broker instances. To access an existing PSTORE on the unloader side, you must set the attribute `PSTORE=HOT`. To load the data into the new PSTORE on the loader side, you must set the attribute `PSTORE=COLD`. The load process requires an empty PSTORE at the beginning of the load process.

**Note:** Use caution not to assign `PSTORE=COLD` to your unload Broker instance, as this startup process will erase all data currently in the PSTORE.

For the migration process, the unload Broker and the load Broker must be assigned different persistent stores.

A report can be generated to detail all of the contents of the existing persistent store. At the end of the migration process, a second report can be run on the resulting new persistent store. These two reports can be compared to ensure that all contents were migrated properly. To run these reports, set the attribute `PSTORE-REPORT=YES`. See `PSTORE` for detailed description, especially for the file assignment.

## Migration Procedure

The migration procedure is made up of three steps.

### Step 1

The unload Broker and the load Broker instances can be started independently of each other. Each instance will wait for the other to become available before starting the unload/load procedure.

The unload Broker instance sends a handshake request to the load Broker instance in order to perform an initial compatibility check. This validation is performed by Broker according to platform architecture type and Broker version number. The handshake ensures a correctly configured partner cluster address and ensures that the user did not assign the same PSTORE to both Broker instances. If a problem is detected, an error message will be issued and both Broker instances will stop.

### Step 2

The unload Broker instance reads all PSTORE data in a special non-destructive raw mode and transmits the data to the load Broker instance. The load Broker instance writes the unchanged raw data to the new PSTORE. A report is created if `PSTORE-REPORT=YES` is specified, and a valid output file for the report is specified.

### Step 3

The unload Broker instance requests a summary report from the load Broker instance to compare the amount of migrated data. The result of this check is reported by the unload Broker instance and the load Broker instance before they shut down.

When a Broker instances is started in `RUN-MODE=PSTORE-LOAD` or `RUN-MODE=PSTORE-UNLOAD`, the Broker instances only allow Administration requests. All other user requests are prohibited.

### Notes:

1. The contents of the persistent store are copied to the new persistent store as an exact replica. No filtering of unnecessary information will be performed, for example, UOWs in received state. The master records will not be updated.
2. Before restarting your Broker with the new persistent store, be sure to change your PSTORE attribute to `PSTORE=HOT`. *Do not* start your broker with the new persistence store using `PSTORE=COLD`; this startup process will erase all of the data in your persistent store.
3. After completing the migration process and restarting your broker in a normal run-mode, it is important not to bring both the new PSTORE and the old PSTORE back online using separate Broker instances; otherwise, applications would receive the same data twice. Once the migration process is completed satisfactorily, and is validated, the old PSTORE contents should be discarded.

# 8 Broker Resource Allocation

---

- General Considerations ..... 112
- Specifying Global Resources ..... 113
- Restricting the Resources of Particular Services ..... 113
- Specifying Attributes for Privileged Services ..... 115
- Maximum Units of Work ..... 116
- Calculating Resources Automatically ..... 116
- Dynamic Memory Management ..... 118
- Dynamic Worker Management ..... 119
- Storage Report ..... 120
- Maximum TCP/IP Connections per Communicator ..... 123

The EntireX Broker is a multithreaded application and communicates among multiple tasks in memory pools. If you do not need to restrict the memory expansion of EntireX Broker, we strongly recommend you enable the dynamic memory management in order to handle changing workload appropriately. See *Dynamic Memory Management* below. If dynamic memory management is disabled, non-expandable memory is allocated during startup to store all internal control blocks and the contents of messages.

## General Considerations

---

Resource considerations apply to both the global and service-specific levels:

- Dynamic assignment of global resources to services that need them prevents the return of a “Resource Shortage” code to an application when resources are available globally. It also enables the EntireX Broker to run with fewer total resources, although it does not guarantee the availability of a specific set of resources for a particular service.
- Flow control ensures that individual services do not influence the behavior of other services by accident, error, or simply overload. This means that you can restrict the resource consumption of particular services in order to shield the other services.

In order to satisfy both global and service-specific requirements, the EntireX Broker allows you to allocate resources for each individual service or define global resources which are then allocated dynamically to any service that needs them.

The resources in question are the number of conversations, number of servers, plus units of work and the message storage, separated in a long buffer of 4096 bytes and short buffer of 256 bytes. These resources are typically the bottleneck in a system, especially when you consider that non-conversational communication is treated as the special case of “conversations with a single message only” within the EntireX Broker.

Global resources are defined by the parameters in the Broker section of the attribute file. The number of conversations allocated to each service is defined in the service-specific section of the attribute file. Because the conversations are shared by all servers that provide the service, a larger number of conversations should be allocated to services that are provided by more than one server. The number of conversations required is also affected by the number of clients accessing the service in parallel.

## Specifying Global Resources

---

You can specify a set of global resources with no restrictions on which service allocates the resources:

- Specify the global attributes with the desired values.
- Do not specify any additional restrictions. That is, do not provide values for the following Broker-specific attributes:

```
LONG-BUFFER-DEFAULT  
SHORT-BUFFER-DEFAULT  
CONV-DEFAULT  
SERVER-DEFAULT
```

- Also, do not provide values for the following server-specific attributes:

```
LONG-BUFFER-LIMIT  
SERVER-LIMIT  
SHORT-BUFFER-LIMIT  
CONV-LIMIT
```

### Example

The following example defines global resources. If no additional definitions are specified, resources are allocated and assigned to any server that needs them.

```
NUM-CONVERSATION=1000  
NUM-LONG-BUFFER=200  
NUM-SHORT-BUFFER=2000  
NUM-SERVER=100
```

## Restricting the Resources of Particular Services

---

You can restrict resource allocation for particular services in advance:

- Use `CONV-LIMIT` to limit the resource consumption for a specific service.
- Use `CONV-DEFAULT` to provide a default limit for services for which `CONV-LIMIT` is not defined.

### Example

In the following example, attributes are used to restrict resource allocation:

```
DEFAULTS=BROKER
NUM-CONVERSATION=1000
CONV-DEFAULT=200

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, CONV-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, CONV-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

- Memory for a total of 1000 conversations is allocated (NUM-CONVERSATION=1000).
- Service A (CLASS A,SERVER A,SERVICE A) is limited to 100 conversation control blocks used simultaneously (CONV-LIMIT=100). The application that wants to start more conversations than specified by the limit policy will receive a “Resource shortage” return code. This return code should result in a retry of the desired operation a little later, when the resource situation may have changed.
- Service B (CLASS B,SERVER B,SERVICE B) is allowed to try to allocate as many resources as necessary, provided the resources are available and not occupied by other services. The number of conversations that may be used by this service is unlimited (CONV-LIMIT=UNLIM).
- Service C (CLASS C,SERVER C,SERVICE C) has no explicit value for the CONV-LIMIT attribute. The number of conversation control blocks that it is allowed to use is therefore limited to the default value which is defined by the CONV-DEFAULT Broker attribute.

The same scheme applies to the allocation of message buffers and servers:

- In the following example, long message buffers are allocated using the keywords NUM-LONG-BUFFER, LONG-BUFFER-DEFAULT and LONG-BUFFER-LIMIT:

```
DEFAULTS=BROKER
NUM-LONG-BUFFER=2000
LONG-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, LONG-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, LONG-BUFFER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

- In the following example, short message buffers are allocated using the keywords NUM-SHORT-BUFFER, SHORT-BUFFER-DEFAULT and SHORT-BUFFER-LIMIT:

```
DEFAULTS=BROKER
NUM-SHORT-BUFFER=2000
SHORT-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SHORT-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, SHORT-BUFFER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

- In the following example, servers are allocated using the keywords NUM-SERVER, SERVER-DEFAULT and SERVER-LIMIT:

```

DEFAULTS=BROKER
NUM-SERVER=2000
SERVER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SERVER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, SERVER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C

```

## Specifying Attributes for Privileged Services

If privileged services (services with access to unlimited resources) exist, specify UNLIMITED for the attributes CONV-LIMIT, SERVER-LIMIT, LONG-BUFFER-LIMIT and SHORT-BUFFER-LIMIT in the service-specific section of the attribute file.

For example:

```

DEFAULTS=SERVICE
CONV-LIMIT=UNLIM
LONG-BUFFER-LIMIT=UNLIM
SHORT-BUFFER-LIMIT=UNLIM
SERVER-LIMIT=UNLIM

```

To ensure a resource reservoir for peak load of privileged services, define more resources than would normally be expected by specifying larger numbers for the Broker attributes that control global resources:

```

NUM-SERVER
NUM-CONVERSATION
CONV-DEFAULT
LONG-BUFFER-DEFAULT
SHORT-BUFFER-DEFAULT
SERVER-DEFAULT

```

## Maximum Units of Work

---

The maximum number of units of work (UOWs) that can be active concurrently is specified in the Broker attribute file. The `MAX-UOWS` attribute can be specified for the Broker globally as well as for individual services. It cannot be calculated automatically. If a service is intended to process UOWs, a `MAX-UOWS` value must be specified.

If message processing only is to be done, specify `MAX-UOWS=0` (zero). The Broker (or the service) will not accept units of work, i.e., it will process only messages that are not part of a UOW. Zero is used as the default value for `MAX-UOWS` in order to prevent the sending of UOWs to services that are not intended to process them.

## Calculating Resources Automatically

---

To ensure that each service runs without impacting other services, allow the EntireX Broker to calculate resource requirements automatically:

- Ensure that the attributes that define the default total for the Broker and the limit for each service are not set to `UNLIM`.
- Specify `AUTO` for the Broker attribute that defines the total number of the resource.
- Specify a suitable value for the Broker attribute that defines the default number of the resource.

The total number required will be calculated from the number defined for each service. The resources that can be calculated this way are Number of Conversations, Number of Servers, Long Message Buffers and Short Message Buffers.

Avoid altering the service-specific definitions at runtime. Doing so could corrupt the conversation consistency. Applications might receive a message such as “`NUM-CONVERSATIONS` reached” although the addressed service does not serve as many conversations as defined. The same applies to the attributes that define the long and short buffer resources.

Automatic resource calculation has the additional advantage of limiting the amount of memory used to run the EntireX Broker. Over time, you should be able to determine which services need more resources by noting the occurrence of the return code “resource shortage, please retry”. You can then increase the resources for these services. To avoid disruption to the user, you could instead allocate a relatively large set of resources initially and then decrease the values using information gained from the Administration Monitor application.

### Number of Conversations

To calculate the total number of conversations automatically, ensure that the `CONV-DEFAULT` Broker attribute and the `CONV-LIMIT` service-specific attribute are not set to `UNLIM` anywhere in the attribute

file. Specify `NUM-CONVERSATION=AUTO` and an appropriate value for the `CONV-DEFAULT` Broker attribute. The total number of conversations will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-CONVERSATION=AUTO
CONV-DEFAULT=200

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A
CLASS=B, SERVER=B, SERVICE=B, CONV-LIMIT=100
CLASS=C, SERVER=C, SERVICE=C
```

- Service A and Service C both need 200 conversations (the default value). Service B needs 100 conversations (`CONV-LIMIT=100`).
- Because `NUM-CONVERSATIONS` is defined as `AUTO`, the broker calculates a total of 500 conversations ( $200 + 200 + 100$ ).
- `NUM-CONVERSATIONS=AUTO` allows the number of conversations to be flexible without requiring additional specifications. It also ensures that the broker is started with enough resources to meet all the demands of the individual services.
- `AUTO` and `UNLIM` are mutually exclusive. If `CONV-DEFAULT` or a single `CONV-LIMIT` is defined as `UNLIM`, the EntireX Broker cannot determine the number of conversations to use in the calculation, and the EntireX Broker cannot be started.

### Number of Servers

To calculate the number of servers automatically, ensure that the `SERVER-DEFAULT` Broker attribute and the `SERVER-LIMIT` service-specific attribute are not set to `UNLIM` anywhere in the attribute file. Specify `NUM-SERVER=AUTO` and an appropriate value for the `SERVER-DEFAULT` Broker attribute. The total number of server buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-SERVER=AUTO
SERVER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SERVER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B
CLASS=C, SERVER=C, SERVICE=C
```

### Long Message Buffers

To calculate the number of long message buffers automatically, ensure that the `LONG-BUFFER-DEFAULT` Broker attribute and the `LONG-BUFFER-LIMIT` service-specific attribute are not set to `UNLIM`

anywhere in the attribute file. Specify `NUM-LONG-BUFFER=AUTO` and an appropriate value for the `LONG-BUFFER-DEFAULT` Broker attribute. The total number of long message buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-LONG-BUFFER=AUTO
LONG-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, LONG-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B
CLASS=C, SERVER=C, SERVICE=C
```

### Short Message Buffers

To calculate the number of short message buffers automatically, ensure that the `SHORT-BUFFER-DEFAULT` Broker attribute and the `SHORT-BUFFER-LIMIT` service-specific attribute are not set to `UNLIM` anywhere in the attribute file. Specify `NUM-SHORT-BUFFER=AUTO` and an appropriate value for the `SHORT-BUFFER-DEFAULT` Broker attribute. The total number of short message buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-SHORT-BUFFER=AUTO
SHORT-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A
CLASS=B, SERVER=B, SERVICE=B, SHORT-BUFFER-LIMIT=100
CLASS=C, SERVER=C, SERVICE=C
```

## Dynamic Memory Management

---

Dynamic memory management is a feature to handle changing Broker workload without any restart of the Broker task. It increases the availability of the Broker by using various memory pools for various Broker resources and by being able to use a variable number of pools for the resources.

If more memory is needed than currently available, another memory pool is allocated for the specific type of resource. If a particular memory pool is no longer used, it will be deallocated.

The following Broker attributes can be omitted if `DYNAMIC-MEMORY-MANAGEMENT=YES` has been defined:

- NUM-CLIENT
- NUM-SERVER
- NUM-UOW|MAX-UOWS|MUOW
- NUM-CMDLOG-FILTER
- NUM-SERVICE
- NUM-WQE
- NUM-COMBUF
- NUM-SERVICE-EXTENSION
- NUM-CONV[ERSATION]
- NUM-SHORT[-BUFFER]
- NUM-LONG[-BUFFER]

If you want statistics on allocation and deallocation operations in Broker, you can configure Broker to create a storage report with the attribute `STORAGE-REPORT`. See [Storage Report](#) below.

**Note:** To ensure a stable environment, some pools of Broker are not deallocated automatically. The first pools of type `COMMUNICATION`, `CONVERSATION`, `CONNECTION`, `HEAP`, `PARTICIPANT`, `PARTICIPANT EXTENSION`, `SERVICE ATTRIBUTES`, `SERVICE`, `SERVICE EXTENSION`, `TIMEOUT QUEUE`, `TRANSLATION`, `WORK QUEUE` are excluded from the automatic deallocation even when they have not been used for quite some time. Large pools cannot be reallocated under some circumstances if the level of fragmentation in the address space has been increased in the meantime.

## Dynamic Worker Management

Dynamic worker management is a feature to handle the fluctuating broker workload without re-starting the Broker task. It adjusts the number of running worker tasks according to current workload. The initial portion of worker tasks started at Broker startup is still determined by `NUM-WORKER`.

If more workers are needed than currently available, another worker task is started. If a worker task is no longer needed, it will be stopped.

The following Broker attributes are used for the configuration if `DYNAMIC-WORKER-MANAGEMENT=YES` has been defined:

- `WORKER-MAX`
- `WORKER-MIN`
- `WORKER-NONACT`
- `WORKER-QUEUE-DEPTH`
- `WORKER-START-DELAY`

The following two attributes are very performance-sensitive:

- Attribute `WORKER-QUEUE-DEPTH` defines the number of unassigned user requests in the input queue before a new worker task is started.

- Attribute `WORKER-START-DELAY` defines the time between the last worker task startup and the next check for another possible worker task startup. It is needed to consider the time for activating a worker task.

Both attributes depend on the environment, in particular the underlying operating system and the hardware. The goal is to achieve high-performance user request processing without starting too many worker tasks.

A good starting point to achieve high performance is not to change the attributes and to observe the performance of the application programs after activating the dynamic worker management.

If broker attribute `DYNAMIC-WORKER-MANAGEMENT=YES` is set, operator commands are available under `z/OS` to deactivate and subsequently reactivate dynamic worker management.

The following section illustrates the two different modes of dynamic worker management:

### ■ Scenario 1

```
DYNAMIC-WORKER-MANAGEMENT=YES
NUM-WORKER = 5
WORKER-MIN = 1
WORKER-MAX = 32
```

Broker is started with 5 worker tasks and then dynamically varies the number of worker tasks within the range from `WORKER-MIN=1` to `WORKER-MAX=32` due to `DYNAMIC-WORKER-MANAGEMENT=YES`.

### ■ Scenario 2

```
DYNAMIC-WORKER-MANAGEMENT=NO
NUM-WORKER = 5
WORKER-MIN = 1
WORKER-MAX = 32
```

Broker is started with 5 worker tasks. The `WORKER-MIN/MAX` attributes are ignored due to `DYNAMIC-WORKER-MANAGEMENT=NO`.

## Storage Report

---

You can create an optional report file that provides details about all activities to allocate or to deallocate memory pools. This section details how to create the report and provides a sample report.

- [Creating a Storage Report](#)
- [Platform-specific Rules](#)
- [Sample Storage Report](#)

See also Broker-specific attribute `STORAGE-REPORT`.

## Creating a Storage Report

Use Broker's global attribute `STORAGE-REPORT` with the value `YES`. If attribute value `YES` is supplied, all memory pool operations will be reported if the output mechanism is available. If the value `NO` is specified, no report will be created.

## Platform-specific Rules

Broker creates a file with the name `STORAGE.REPORT` in the current working directory. If the environment variable `ETB_STORAGE_REPORT` is supplied, the file name specified in the environment variable will be used. If Broker receives the command-line argument `-r`, the token following argument `-r` will be used as the file name.

## Sample Storage Report

The following is an excerpt from a sample `STORAGE` report.

EntireX 8.1.0.00		STORAGE Report		2009-06-26 12:28:58	Page	1

Header	Description
Identifier	Name of the memory pool.
Address	Start address of the memory pool.
Size	Size of the memory pool.
Total	Total size of all obtained memory pools.
Date, Time	Date and time of the action.
Action	The action of Broker. The following actions are currently supported: Allocated: memory pool is allocated . Deallocated: memory pool is deallocated.

## Maximum TCP/IP Connections per Communicator

This table shows the maximum number of TCP/IP connections per communicator:

Platform	Maximum Number of TCP/IP Connections per Communicator
AIX	2,048
BS2000	2,048
HP-UX	2,048
Linux	4,096
Solaris	65,356
Windows	4,096
z/OS	16,384
z/VSE	2,048

With the Broker-specific attribute `POLL`, these restrictions can be lifted under z/OS, UNIX and z/VSE. See `POLL`.

See also `MAX-CONNECTIONS` under `TCP-OBJECT` (Struct `INFO_TCP`) under *Broker CIS Data Structures* in the EntireX Broker ACI Programming documentation.

# 9 Administering Broker Stubs

---

▪ Available Stubs .....	126
▪ Transport Methods for Broker Stubs .....	126
▪ Tracing for Broker Stubs .....	130
▪ Support of Clustering in a High Availability Scenario .....	131

## Available Stubs

---

The following table lists available stubs and gives an overview of available features and supported transport methods.

Stub	Language	Transport Methods	More Information
broker.dll *	C	TCP / SSL	See below.
Jaci	Java	TCP /SSL	See <i>EntireX Java ACI</i> .

(\*) Stub broker32.dll is still supported for reasons of backward compatibility. The functionality is identical to broker.dll.

## Transport Methods for Broker Stubs

---

The Broker stub can use TCP/IP and Secure Sockets Layer.

- [Using TCP/IP as Transport Method for the Broker Stub](#)
- [Using SSL/TLS as Transport Method for the Broker Stub](#)
- [Setting the Timeout for the Transport Method](#)
- [Limiting the TCP/IP Connection Lifetime](#)
- [Modifying the Hosts and Services Tables](#)

### Using TCP/IP as Transport Method for the Broker Stub

#### ➤ To use TCP/IP

- 1 Optional: set the timeout, see [Setting the Timeout for the Transport Method](#).
- 2 The Broker stub requires the IP address and the TCP port number (if the Broker's default TCP port number 1971 cannot be used) for each BROKER-ID. Either add an entry in the Domain Name System (DNS) or modify your local hosts and services tables. See [Modifying the Hosts and Services Tables](#).

You can check whether the Broker has already been added to your DNS with the command:

```
ping <broker-id>
```

for example: ping ETB001. If a message such as "...is alive" or "Reply from ..." is displayed (the text displayed varies depending on your ping implementation), the name is known to your DNS and the host where the Broker is running is reachable. However, this does not necessarily mean that the Broker is active.

## Using SSL/TLS as Transport Method for the Broker Stub

ACI applications can use Secure Sockets Layer/Transport Layer Security (SSL/TLS) as the transport medium. The term "SSL" in this section refers to both SSL and TLS. ACI-based clients or servers are always SSL clients. The SSL server can be either the EntireX Broker or the Broker SSL Agent. For an introduction see *SSL/TLS and Certificates with EntireX* in the EntireX Security documentation.

With the Broker ACI, the SSL parameters (e.g. certificates) are provided with the function SETSSLPARAMS.

### > To use SSL

- 1 To operate with SSL, certificates need to be provided and maintained. Depending on the platform, Software AG provides default certificates, but we strongly recommend that you create your own. See *SSL/TLS Sample Certificates Delivered with EntireX* in the EntireX Security documentation.
- 2 Specify the Broker ID, using one of the following styles:

- *URL Style*, for example:

```
ssl://localhost:2010
```

- *Transport-method Style*, for example:

```
ETB024:1609:SSL
```

If no port number is specified, port 1958 is used as default.

- 3 Specify SSL parameters in the second parameter, for example:

```
'broker' etbc "VERIFY_SERVER=N&TRUST_STORE=c:\\certs\\CaCert.pem"
```

If the SSL client checks the validity of the SSL server only, this is known as *one-way SSL*. The mandatory `trust_store` parameter specifies the file name of a keystore that must contain the list of trusted certificate authorities for the certificate of the SSL server. By default a check is made that the certificate of the SSL server is issued for the hostname specified in the Broker ID. The common name of the subject entry in the server's certificate is checked against the

hostname. If they do not match, the connection will be refused. You can disable this check with SSL parameter `verify_server=no`.

If the SSL server additionally checks the identity of the SSL client, this is known as *two-way SSL*. In this case the SSL server requests a client certificate (the parameter `verify_client=yes` is defined in the configuration of the SSL server). Two additional SSL parameters must be specified on the SSL client side: `key_store` and `key_passwd`. This keystore must contain the private key of the SSL client. The password that protects the private key is specified with `key_passwd`.

The ampersand (&) character cannot appear in the password.

SSL parameters are separated by ampersand (&). See also *SSL/TLS Parameters for SSL Clients*.

- 4 Make sure the SSL server to which the ACI side connects is prepared for SSL connections as well. The SSL server can be EntireX Broker or Broker SSL Agent. See:
  - *Running Broker with SSL/TLS Transport* in the platform-specific Administration documentation
  - *Setting up and Administering the EntireX Broker SSL Agent* in the UNIX and Windows Administration documentation

## Notes

- See table *Using SSL/TLS with EntireX Components* if SSL is required for other EntireX components.
- The Broker stub requires the IP address and the SSL port number for each `BROKER-ID`. Either add an entry to the Domain Name System (DNS) or modify your local hosts and services tables. See *Modifying the Hosts and Services Tables*.

If no port number is specified, port 1958 is used as default.

- You can check whether the Broker has already been added to your DNS with a `ping <broker-id>` command, for example:

```
ping ETB001
```

If a message such as "...is alive" or "Reply from ..." is displayed (the text displayed varies depending on your ping implementation), the name is known to your DNS and the host where the Broker is running is reachable. However, this does not necessarily mean that the Broker is active.

- Take care if trace is switched on:
  - ❗ **Caution:** If stub tracing level is > 1, unencrypted contents of the send/receive buffers are exposed in the trace.
- Example on running the delivered ACI example:

```
C:\SoftwareAG\EntireX\examples\ACI\conversational\C\convSvr -blocalhost:1958:SSL
-cAClass -sASERVER -vASERVICE
-x"VERIFY_SERVER=N&TRUST_STORE=C:\SoftwareAG\EntireX\etc\ExxCACert.pem"
```

## Setting the Timeout for the Transport Method

The timeout settings of the transport layers are independent of the broker's timeout settings, which are set by the application in the `WAIT` field of the broker ACI control block.

If the transport layer is interrupted, communication between the Broker and the stub (i.e. client or server application) is interrupted as well. To prevent a client from waiting for a Broker reply indefinitely, set a timeout value for the transport method. The actual timeout for the procedure is then the Broker timeout (which is set by the application in the field `WAIT` (see *Broker ACI Fields*) plus this value.

### > To set a transport timeout value

- Set the environment variable `ETB_TIMEOUT`:

Value	Description
0	Infinite wait for the application.
<i>n</i>	Transport method waits additional time in seconds. Negative values are treated as <code>ETB_TIMEOUT=0</code> , i.e. infinite wait.
No environment variable defined	Transport method waits additional 20 seconds.

## Limiting the TCP/IP Connection Lifetime

With transport method TCP/IP, the broker stub establishes one or more TCP/IP connections to the brokers specified with `BROKER-ID`. These connections can be controlled by the transport-specific `CONNECTION-NONACT` attribute on the broker side, but also by the transport-specific environment variable `ETB_NONACT` on the stub side. If `ETB_NONACT` is not 0, it defines the non-activity time (in seconds) of active TCP/IP connections to any broker. See `ETB_NONACT` under *Environment Variables in EntireX*. Whenever the broker stub is called, it checks for the elapsed non-activity time and closes connections with a non-activity time greater than the value defined with `ETB_NONACT`.

Transport Non-activity Value	Description
0	Infinite lifetime until application is stopped.
<i>n</i> (seconds)	Transport connections with non-activity time greater than <i>n</i> will be closed.
Nothing set	Infinite lifetime until application is stopped.

## Modifying the Hosts and Services Tables

### > To add an entry to the hosts table

- Add a line similar to the following to the local hosts file:

```
100.100.1.1 ETB226 # ETB test host name
```

### > To add an entry to the services table

- Add lines similar to the following to the local services file:

```
ETB226 18492/tcp # ETB test host name
ETB411 21234/tcp # ETB production host name
```

## Tracing for Broker Stubs

---

The broker stubs provide an option for writing trace files.

### > To switch on tracing for the broker stub

- Before starting the client application, set the environment variable `ETB_STUBLOG`:

Trace Value	Trace Level	Description
0	NONE	No tracing.
1	STANDARD	Traces initialization, errors, and all ACI request/reply strings.
2	ADVANCED	Used primarily by system engineers, traces everything from level 1 and provides additional information - for example the Broker ACI control block - as well as transport information.
3	SUPPORT	This is full tracing through the stub, including detailed traces of control blocks, message information, etc.

Example:

```
ETB_STUBLOG=2
```

If the trace level is greater than 1, unencrypted contents of the send/receive buffers may be exposed in the trace.

Trace output, file *<thread-id>.etb*, is written to the trace directory. The location of the trace file depends on the settings of environment variable `%USERPROFILE%`, for example:

```
C:\Documents And Settings\\My Documents\Software AG\EntireX
```

See *Trace Directory*.

Remember to switch off tracing to prevent trace files from filling up your disk.

#### ➤ To switch off tracing for the broker stub

- Set the environment variable `ETB_STUBLOG` to `NONE` or delete it.

## Support of Clustering in a High Availability Scenario

EntireX Broker supports clustering in a high-availability scenario, using the environment variable `ETB_SOCKETPOOL`. See *Environment Variables in EntireX*. This section covers the following topics:

- [Introduction](#)
- [Exceptions](#)
- [Default](#)

See also *High Availability in EntireX*.

### Introduction

A TCP/IP connection established between stub and broker is not exclusively assigned to a particular thread. With multithreaded applications, two or more threads may use the same connection. On the other hand, if a connection is busy, another new one is created to exchange data.

In order to access the same broker instance in a clustering environment, an affinity between application thread and TCP/IP connection is needed to always use the same connection within an application thread. Therefore, an environment variable is evaluated to control the handling of TCP/IP connections.

If environment variable `ETB_SOCKETPOOL` is set to "OFF" (`ETB_SOCKETPOOL=OFF`), an affinity between threads and TCP/IP connections is established. All requests to one particular broker will use the same TCP/IP connection. `ETB_SOCKETPOOL` controls all TCP/IP connections.

## Exceptions

Broker attribute `CONNECTION-NONACT` is used by the broker to close TCP/IP connections after the elapsed non-activity time. Omit this attribute to keep the TCP/IP connection alive.

## Default

`ETB_SOCKETPOOL=ON` is the default setting. In this case, an established broker connection can be used by any thread if the connection is not busy.

# 10 Broker Command-line Utilities

---

- etbinfo ..... 134
- etbcmd ..... 141

EntireX Broker provides the following internal services: Command Service, Information Service and Administration Service, which can be used to administer and monitor brokers and RPC servers. Because these services are implemented internally, nothing has to be started or configured. You can use these services immediately after starting EntireX Broker.

## etbinfo

---

Queries the Broker for different types of information, generating an output text string with basic formatting. This text output can be further processed by script languages. `etbinfo` uses data descriptions called profiles to control the type of data that is returned for a request. `etbinfo` is useful for monitoring and administering EntireX Broker efficiently, for example how many users can run concurrently and whether the number of specified message containers is large enough.

Although basic formatting of the output is available, it is usually formatted by script languages or other means external to the Broker.

- [Running the Command-line Utility](#)
- [Command-line Parameters](#)
- [Command-line Parameters from File](#)
- [Profile](#)
- [Format String](#)
- [Using SSL/TLS](#)

### Running the Command-line Utility

In a Windows environment, run the command-line utility with `etbinfo`. If the environment variable `LOGNAME` is not set, you must use the `-x` option (see below) to provide a user ID if the Broker is running with EntireX Security. `etbinfo` is located in directory `<drive>:\SoftwareAG\EntireX\bin`.

### Command-line Parameters

The table below explains the command-line parameters. The format string and profile parameters are described in detail following the table. All entries in the Option column are case-sensitive.

Option	Command-line Parameter	Req/ Opt	Explanation
-b	brokerid	R	Broker identifier, for example <code>localhost:1971:TCP</code> .
-c	class	O	Class as selection criterion.
-C		O	Create output with comma-separated values, suitable for input into a spreadsheet or other analysis tool. Any format string specified by means of format string or profile command-line parameters is ignored.

Option	Command-line Parameter	Req/ Opt	Explanation
-d	object	R	<p>Possible values:</p> <p><b>Object</b> Provides Info on</p> <p>BROKER Broker.</p> <p>CLIENT Client.</p> <p>CMDLOG-FILTER Command log filter.</p> <p>CONVERSATION Conversation.</p> <p>NET Entire Net-Work transport.</p> <p>PARTICIPANT Participant.</p> <p>POOL-USAGE Broker pool usage.</p> <p>PSF Unit-of-work status.</p> <p>PSFADA Adabas persistent store.</p> <p>PSFCTREE c-tree persistent store.</p> <p>PSFDIV DIV persistent store.</p> <p>RESOURCE-USAGE Broker resource usage.</p> <p>SECURITY EntireX Security.</p> <p>SERVER Server.</p> <p>SERVICE Service.</p> <p>SSL SSL transport.</p> <p>STATISTICS Broker statistics.</p> <p>TCP TCP transport.</p> <p>UOW-STATISTICS Units of work per service.</p> <p>USER Participant (short).</p> <p>WORKER Worker.</p> <p>WORKER-USAGE Worker usage.</p>
-e	recv class	O	Receiver's class name. This selection criterion is valid only for object PSF.
-f	<i>Format String</i>	O	Format string how you expect the output. See <i>Profile</i> .
-g	recv service	O	Receiver's service name. This selection criterion is valid only for object PSF.
-h	help	O	Prints help information.
-i	convid	O	Conversation ID as selection criterion. Only valid for object CONVERSATION.
-I	conv type	O	Conversation's type.
-j	recv server	O	Receiver's server name. This selection criterion is valid only for object PSF.
-k	recv token	O	Receiver's token. This selection criterion is valid only for object PSF.

Option	Command-line Parameter	Req/ Opt	Explanation
-l	level	O	The amount of information displayed:  FULL All information. SHORT User-specific information.
-m	recv userid	O	Receiver's user ID. This selection criterion is valid only for object PSF.
-n	server name	O	Server name. This selection criterion is valid only for the objects SERVER, SERVICE or CONVERSATION.
-p	file	O	Here you can specify a file that defines the layout of the output. There are default files you can modify or you can use your own. The default files are:  BROKER CLIENT CLOGFLT CONV NET POOL PSF PSFADA PSFCTREE PSFDIV SERVICE SSL STATIS STATIS TCP USER WORKER WKRUSAGE See <a href="#">Profile</a> .
-q	userid	O	Physical user ID. This selection criterion is valid only for objects CLIENT, SERVER, CONVERSATION,  <b>Note:</b> Must be a hex value.
-r	sec	O	Refresh information after seconds.
-s	service	O	Service. This selection criterion is valid only for objects SERVER, SERVICE or CONVERSATION.
-S	"sslparms"	O	When using SSL transport for Broker communication. See <a href="#">Using SSL/TLS</a> .
-t	token	O	This selection criterion is valid only for objects CLIENT, SERVER, SERVICE or CONVERSATION.
-u	userid	O	User ID. This selection criterion is only valid for the display types CLIENT, SERVER, SERVICE or CONVERSATION.
-v	UOW status	O	Unit of work status. This selection criterion is valid only for object PSF.
-w	UOW ID	O	Unit of work ID. This selection criterion is valid only for object PSF.
-x	userid	O	User ID. For security purposes.
-y	password	O	Password. For security purposes.
-z	token	O	Used with <code>userid</code> to uniquely identify a caller to Command and Information Services.
--longmsg		O	If an error occurs, delivers the long text of an error message, corresponding to <i>Error Messages and Codes</i> . Output is generated as with the <code>exxmsg</code> utility. See <i>EXXMSG - Command-line Tool for Displaying Error Messages</i> in the <i>Error Messages and Codes</i> documentation.
--external		O	Reduces the output of SERVICE objects to external services. Broker-internal services are not displayed.

Option	Command-line Parameter	Req/ Opt	Explanation
--internal		O	Reduces the output of SERVICE objects to Broker-internal services. The external user-specific services are not displayed.
--pingrpc		O	Executes an RPC ping to a specified RPC service. The parameters -c <class_name>, -n <server_name> and -s <service> are also required. If the service is running, return code 0 and a corresponding text are returned. If the service is not running, a return code other than 0 is given.

### Command-line Parameters from File

etbinfo supports an alternative method of passing command-line parameters.

If the environment variable `INF_ATTR` is set, the content is interpreted as a file name. If no command-line parameters are given, the command `etbinfo` evaluates the content of the file. Example:

```
-blocalhost:3930:TCP
-dBROKER
```

### Profile

If you do not use the profile option or a format string, your output will be an unformatted list with all columns of that display type. To display specific columns, specify a profile that includes only those columns.

The following default sample profiles include all the columns defined for each display type:

```
■ BROKER ■ PSFADA ■ SSL
■ CLIENT ■ PSFCTREE ■ STATIS
■ CLOGFLT ■ PSFDIV ■ TCP
■ CONV ■ RESOURCE ■ USER
■ NET ■ SECURITY ■ WKRUSAGE
■ POOL ■ SERVER ■ WORKER
■ PSF ■ SERVICE
```

You can either delete the columns not required or copy the default profile and modify the order of the columns. Ensure that the column names have a leading "%". Column names can be written in one line or on separate lines. The output is always written side by side. With profile parameters `%DATE` and `%TIME` you can provide a timestamp for the command-line query.

### Location of Profiles

On Windows, the profiles are contained in directory *<drive>:\SoftwareAG\EntireX\etc* and are named *broker.pro*, *client.pro* etc.

### Example 1

Profile for object SERVICE: SERVICE.

```
etbinfo -b ETB001 -d SERVICE -p service.pro -l FULL
```

The following list is displayed:

```
SAG          ETBCIS      INFO
 1 0 16 86400 0 31647 0 00 00 00 0 0
SAG          ETBCIS      USER-INFO
 2 0 16 86400 0 31647 0 00 00 00 0 0
SAG          ETBCIS      CMD
 6 0 16 86400 0 31647 0 00 00 00 0 0
```

### Example 2

Your own profile: MYPROF

```
etbinfo -b ETB001 -d SERVICE -p my_service.pro
```

**Note:** In this case, *my\_service.pro* contains: %4.4SERVERCLASS %SERVERNAME

The following list is displayed:

```
ACLA      ASERVER
BCLA      BSERVER
CCLA      CSERVER
```

### Sample Profiles for etbinfo

You can find the sample profiles for *etbinfo* in your *<drive>:\SoftwareAG\EntireX\EntireX\config* directory.

## Format String

The format string, if specified, will override the use of a profile. The format string is built like a `printf()` in C language. The string must be enclosed in quotation marks. You can specify the columns by using a “%” and the column name. The column name must contain letters only. Numeric characters are not allowed. You can specify the length of column output by using a format precision, as in the ANSI-C `printf()` function. The column name must be followed by a blank. For example:

```
etbinfo -b ETB001 -d BROKER -f "%12.12CPLATNAME %NUM-SERVER %NUM-CLIENT"
```

which produces the following output, for example:

```
MVS/SP 7.04 30 100
```

You can also use an arbitrary column separator, which can be any character other than “%”. You can use `\n` for a new line in the output and `\t` for a tabulator in the format string or profile. For example:

```
etbinfo -b ETB001 -d SERVER -f "UserID: %5.5USER-ID Token: %5.5TOKEN"
```

which produces:

```
UserID: HUGO Token: MYTOK
UserID: EGON Token:
UserID: HELMU Token: Helmu
```

If you want to structure your output a little more, you can operate with the `\n` or `\t` character. For example:

```
etbinfo -b ETB001 -d SERVICE -f "Class:%5.5SERVER-CLASS \n\tName:%5.5SERVER-NAME \n\tService:%5.5SERVICE"
```

which produces:

```
Class:DATAB
  Name:DB10
  Service:Admin
Class:PRINT
  Name:LPT1
  Service:PRINT
...
```

You can also add a timestamp to the query:

```
etbinfo -b ETB001 -d BROKER -f "%DATE %TIME"
```

which produces:

```
2014-08-19 10:00:00.234
```

## Using SSL/TLS

### » To set up SSL

- 1 To operate with SSL, certificates need to be provided and maintained. Depending on the platform, Software AG provides default certificates, but we strongly recommend that you create your own. See *SSL/TLS Sample Certificates Delivered with EntireX* in the EntireX Security documentation.
- 2 Specify the Broker ID, using one of the following styles:

- *URL Style*, for example:

```
ssl://localhost:2010
```

- *Transport-method Style*, for example:

```
ETB024:1609:SSL
```

If no port number is specified, port 1958 is used as default.

- 3 Specify SSL parameters with the option `-s|S` (lowercase for `etbcmd`; uppercase for `etbinfo`). See *SSL/TLS Parameters for SSL Clients*.
- 4 Make sure the broker is prepared for SSL connections as well. See *Running Broker with SSL/TLS Transport* in the platform-specific Administration documentation.

## etbcmd

Allows the user to take actions - for example purge a unit of work, stop a server, shut down a Broker - against EntireX Broker.

- [Running the Command-line Utility](#)
- [Command-line Parameters](#)
- [Command-line Parameters from File](#)
- [List of Commands and Objects](#)
- [Examples](#)
- [Using SSL/TLS](#)

### Running the Command-line Utility

In a Windows environment, run the command-line utility with `etbcmd`. If the environment variable `LOGNAME` is not set, you must use the `-x` option (see below) to provide a user ID if the Broker is running with EntireX Security. `etbcmd` is located in the directory `<drive>:\SoftwareAG\EntireX\bin`.

### Command-line Parameters

The table below explains the command-line parameters. All entries in the **Option** column are case-sensitive.

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
brokerid	-b	e.g. ETB001	R	Broker ID.
command	-c	<ul style="list-style-type: none"> <li>■ ALLOW-NEUOWMSGs</li> <li>■ CLEAR-CMDLOG-FILTER</li> <li>■ CONNECT-PSTORE</li> <li>■ DISABLE-ACCOUNTING</li> <li>■ DISABLE-CMDLOG-FILTER</li> <li>■ DISABLE-CMDLOG</li> <li>■ DISABLE-DYN-WORKER</li> <li>■ DISCONNECT-PSTORE</li> <li>■ ENABLE-ACCOUNTING</li> <li>■ ENABLE-CMDLOG-FILTER</li> <li>■ ENABLE-CMDLOG</li> <li>■ ENABLE-DYN-WORKER</li> <li>■ FORBID-NEUOWMSGs</li> </ul>	R	Command to be performed. See <a href="#">List of Commands and Objects</a> below.

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
		<ul style="list-style-type: none"> <li>■ PING</li> <li>■ PRODUCE-STATISTICS</li> <li>■ PURGE</li> <li>■ RESET-USER</li> <li>■ RESUME</li> <li>■ SET-CMDLOG-FILTER</li> <li>■ SET-UOW-STATUS</li> <li>■ SHUTDOWN</li> <li>■ START</li> <li>■ STATUS</li> <li>■ STOP</li> <li>■ SUSPEND</li> <li>■ SWITCH-CMDLOG</li> <li>■ TRACE-FLUSH</li> <li>■ TRACE-OFF</li> <li>■ TRACE-ON</li> <li>■ TRAP-ERROR</li> </ul>		
object type	-d	<ul style="list-style-type: none"> <li>■ BROKER</li> <li>■ CONVERSATION</li> <li>■ PARTICIPANT</li> <li>■ PSF</li> <li>■ SECURITY</li> <li>■ SERVER</li> <li>■ SERVICE</li> <li>■ TRANSPORT</li> </ul>	R	The object type to be operated on. See <a href="#">List of Commands and Objects</a> below. Within EntireX Broker nomenclature, a participant is an application implicitly or explicitly logged on to the Broker as a specific user. A participant could act as client or server.
	-e	errornumber	O	Error number being trapped.
	-E		O	Exclude attach servers from service shutdown.
help	-h		O	Prints help information.
class/server/service	-n	class/server/service	O	Service triplet.
option	-o	<ul style="list-style-type: none"> <li>■ ACCEPTED</li> <li>■ CANCELLED</li> <li>■ IMMED</li> </ul>	O	Command option.

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
		<ul style="list-style-type: none"> <li>■ QUIESCE</li> <li>■ LEVEL <math>n</math>, where <math>n=1-8</math></li> </ul>		
userid	-p	userid	O	Physical User ID. For SERVER and PARTICIPANT objects only. This must be a hex value.
sslparms	-s	SSL parameters	O	When using SSL transport for broker communication. See <a href="#">Using SSL/TLS</a> .
seqno	-S	sequence number	O	Sequence number of participant.
token	-t	token	O	Token. For PARTICIPANT object only.
uowid	-u	uowid	O	Unit of work ID. For PSF object only.
userid	-U	userid	O	User ID. For PARTICIPANT object only.
secuserid	-x	userid	O	User ID for security purposes.
transportid	-X	Transport ID	O	One of the following: COM NET SSL S $nn$  TCP T $nn$ . See table below.
secpassword	-y	password	O	Password for security purposes.

### Transport ID Values

This table explains the possible values for parameter `transportid`:

Transport ID	Explanation
COM	all communicators
NET	NET transport communicator
SSL	all SSL communicators
S00	SSL communicator 1
S01	SSL communicator 2
S02	SSL communicator 3
S03	SSL communicator 4
S04	SSL communicator 5
TCP	all TCP/IP communicators
T00	TCP/IP communicator 1
T01	TCP/IP communicator 2
T02	TCP/IP communicator 3
T03	TCP/IP communicator 4
T04	TCP/IP communicator 5

### Command-line Parameters from File

etbcd supports an alternative method of passing command-line parameters.

### List of Commands and Objects

This table lists the available commands and the objects to which they can be applied.

Command	Object							
	BROKER	CONVERSATION	PARTICIPANT	PSF	SECURITY	SERVER	SERVICE	TRANSPORT
ALLOW-NEUOWMSGS				x				
CLEAR-CMDLOG-FILTER	x							
CONNECT-PSTORE				x				
DISABLE-ACCOUNTING	x							
DISABLE-CMDLOG-FILTER	x							
DISABLE-CMDLOG	x							
DISCONNECT-PSTORE				x				
ENABLE-ACCOUNTING	x							
ENABLE-CMDLOG-FILTER	x							
ENABLE-CMDLOG	x							
FORBID-NEUOWMSGS				x				
PING	x							
PRODUCE-STATISTICS	x							
PURGE				x				
RESET-USER					x			
SET-CMDLOG-FILTER	x							
SET-UOW-STATUS				x				
SHUTDOWN	x	x	x			x	x	
START								x
STATUS								x
STOP								x
SWITCH-CMDLOG	x							
TRACE-OFF	x			x	x			
TRACE-ON	x			x	x			

 **Note:** Object type `TRANSPORT` applies to operating systems z/OS and z/VSE only.

### Examples

Example	Description
<code>etbcmd -b etb001 -h</code>	Displays ETBCMD help text.
<code>etbcmd -b etb001 -d BROKER -c TRACE-OFF</code>	Turns Broker tracing off.
<code>etbcmd -b etb001 -d BROKER -c TRACE-ON -o LEVEL2</code>	Sets Broker trace level to 2.
<code>etbcmd -b etb001 -d BROKER -c SHUTDOWN</code>	Performs Broker shutdown.
<code>etbcmd -b etb001 -d SERVICE -c SHUTDOWN -o IMMED -n ACLASS/ASERVER/ASERVICE</code>	Shutdown service CLASS=AClass, SERVER=AServer, SERVICE=AService. See also SHUTDOWN SERVICE for more information on shutdown options.
	Create list of servers and shutdown specific server in two steps (first step uses <code>etbinfo</code> ). See also SHUTDOWN SERVER.
<code>etbinfo -b etb001 -d SERVER -l FULL -f"%USER-ID %SEQNO"</code>	1. Determine a list of all servers with sequence numbers.
<code>etbcmd -b etb001 -d SERVER -c SHUTDOWN -o IMMED -S32</code>	2. Shutdown server with sequence number 32.
<code>etbcmd -b etb001 -d BROKER -c PING</code>	Performs an EntireX ping against the Broker.
<code>etbcmd -b etb001 -d PSF -c DISCONNECT-PSTORE</code>	Disconnects the Broker PSTORE.
<code>etbcmd -b etb001 -d PSF -c CONNECT-PSTORE</code>	Connects the Broker PSTORE.
<code>etbcmd -b etb001 -d PSF -c PURGE -u 100000000U00001A</code>	Purges a unit of work.
<code>etbcmd -b etb001 -d PSF -c ALLOW-NEUOWMSGs</code>	Allows new units of work to be stored.
<code>etbcmd -b etb001 -d PSF -c FORBID-NEUOWMSGs</code>	Disallows new units of work to be stored.
<code>etbcmd -b etb001 -d PSF -c SET-UOW-STATUS -o ACCEPTED -n ACLASS/ASERVER/ASERVICE</code>	Sets the status of UOWs that reside in the postpone queue back to ACCEPTED for service ACLASS/ASERVER/ASERVICE. See also <i>Postponing Units of Work</i> under <i>Using Persistence and Units of Work</i> in the Platform-independent Administration documentation.
<code>etbcmd -b etb001 -d PSF -c SET-UOW-STATUS -o CANCELLED -u 0010000000000100</code>	Cancel UOW with UOWID 0010000000000100 that resides in the postpone queue. See also <i>Postponing Units of Work</i> .

## Using SSL/TLS

### > To set up SSL

- 1 To operate with SSL, certificates need to be provided and maintained. Depending on the platform, Software AG provides default certificates, but we strongly recommend that you create your own. See *SSL/TLS Sample Certificates Delivered with EntireX* in the EntireX Security documentation.
- 2 Specify the Broker ID, using one of the following styles:

- *URL Style*, for example:

```
ssl://localhost:2010
```

- *Transport-method Style*, for example:

```
ETB024:1609:SSL
```

If no port number is specified, port 1958 is used as default.

- 3 Specify SSL parameters with the option `-s|S` (lowercase for `etbcmd`; uppercase for `etbinfo`). See *SSL/TLS Parameters for SSL Clients*.
- 4 Make sure the broker is prepared for SSL connections as well. See *Running Broker with SSL/TLS Transport* in the platform-specific Administration documentation.

# 11 Attach Manager

---

▪ Prerequisites .....	148
▪ Setting up the Attach Manager .....	148
▪ Configuration File Syntax .....	150
▪ Sample Configuration File .....	154
▪ Operating the Attach Manager .....	157

EntireX includes an Attach Manager (ATM) for UNIX and Windows. This is used to start servers if a client requests a particular service from the Broker, but a server for that service is not active. This chapter covers the following topics:

## Prerequisites

---

The Attach Manager needs the following:

- An active task registered at the Broker. As of EntireX 9.9, the ATM task is no longer launched automatically on each computer where EntireX is installed. See [Setting up the Attach Manager](#) for how to start the Attach Manager automatically or manually.
- A list of services the ATM is responsible for, and information on how to start the corresponding server for a particular service. The Attach Manager can start only processes that are local to where it is running, that is, the process that is attached will be run from the command line. There is no restriction, however, on what the started command-line process does, including starting a remote process on another system that will REGISTER as the server that satisfies the attach request.
- A configuration file that contains the service list the ATM is responsible for, information on how to start the corresponding server and additional configuration parameter to control the ATM functionality.

## Setting up the Attach Manager

---

If you do not need the ATM for your own services, you do not need to perform any configuration for the ATM. A default configuration file *EXXATM.cfg* comes with the EntireX installation and contains the necessary configuration to start the EntireX sample servers. The file is located in directory *EntireX/config/service/appl.EXXATM*.

**Note:** In the current version of EntireX, the ATM is *not* launched automatically by default.

### > To launch the Attach Manager automatically

- 1 Enter the installation user as “Run as” user. Press **Enter** and enter the user password. The Broker Administration Service checks the password and uses it to start the Attach Manager under the specified user ID.

```
etbsrv RUN-AS-USER ENABLE EXXADM <user>
```

- 2 Activate automatic start after a reboot or after a restart of the Broker Administrator Service with the following command.

```
etbsrv SERVICE ATTR EXXATM AUTOSTART=YES
```

With the next reboot, ATM is then launched automatically. The working directory is *EntireX/config/service/appl.EXXATM*. All log files are written to this directory. It also contains the configuration file *EXXATM.cfg* of the Attach Manager. See [Configuration File Syntax](#).

#### ➤ To deactivate automatic start of the Attach Manager

- Enter command:

```
etbsrv SERVICE ATTR EXXATM AUTOSTART=NO
```

#### ➤ To check the status of the default Attach Manager

- Enter command:

```
etbsrv SERVICE STATUS EXXATM
```

#### ➤ To start and stop the default Attach Manager manually

- Enter one of the following commands:

```
etbsrv SERVICE START EXXATM
```

```
etbsrv SERVICE RESTART EXXATM
```

```
etbsrv SERVICE STOP EXXATM
```

#### ➤ To show the current status of the Attach Manager process

- Enter command:

```
etbsrv SERVICE STATUS
```

The Attach Manager is located in the *bin* subdirectory under the installed EntireX directory. The name of the executable is *exxatm.exe*. If you need to start an ATM manually for any reason, start it using this executable. You can start multiple ATMs, for example to run them under different accounts. But all ATM instances should share the same configuration file. The configuration file is organized in so-called sections to support multiple ATM instances. Without further command-line arguments, the ATM uses the default section within the default configuration file. See [Operating the Attach Manager](#) for possible command-line arguments.

## Configuration File Syntax

---

The syntax of the text-based configuration file is simple and is very similar to a Windows INI file.

Syntax Element	Description
;	Lines beginning with a semicolon are comment lines.
[ ]	Lines that contain text in square brackets are section headers.
Keyword=Value	Lines that are of the form <code>Keyword=Value</code> are keyword lines.

**Note:** Any of the values of the keywords in the configuration file can be set as environment variables.

There are three different types of sections in the configuration file:

- The ATM section to configure a particular ATM instance. The ATM section with the name "Default" is the default section. If no section with the name "Default" is found, the first ATM section in the file is the default section. Each ATM section contains the configuration parameters of the corresponding ATM instance and has one related Service List section, which refers to the services that this ATM supports. Each ATM section needs exactly one ATM server attaching the related servers if requested.
- The Service List section contains a list of names of Service sections. The name of the Service List section is the name of the related ATM section appended by "\_Services".
- The Service section configures a service, which consists of the service name and how to start the corresponding server.

The general structure of the configuration file is the following:

```
[Default]
; The parameters of the Default ATM
[Default_Services]
SERVICE1=
SERVICE2=
[SERVICE1]
; The parameters for SERVICE1
[SERVICE2]
; The parameters for SERVICE1
```

- [Parameters of the ATM Section](#)
- [Parameters of the Service List Section](#)
- [Parameters of the Service Section](#)

## Parameters of the ATM Section

These sections define the Attach Manager itself and contain the keywords indicated in this table. There can be up to 16 of these sections.

Keyword	Definition and Value	Format	Example	Notes
BrokerID=	The Broker that ATM will communicate with and answer attach requests. Any valid ACI broker ID value is allowed.	A32	BrokerID=server1:1971:TCP	
SSLParms=	Secure Sockets Layer parameters for brokers that use SSL transport.	A512	SSLParms=VERIFY_ SERVER=N&TRUST_STORE=C:\\Temp\\ExxCACert.pem	
ServerClass= ServerName= Service=	The CLASS/SERVER/SERVICE names that can be used by ATM to send commands to ATM. The CLASS/SERVER/SERVICE name needs to be defined in the <i>Broker Attributes</i> .	A32 [for all keywords]	ServerClass=System ServerName=DefaultMain Service=Command	
UserID=	The user ID of the ATM.	A32	UserID=atman	
Token=	The token of the ATM (used for unique identification of the user ID). There is a special value of {GeneratedToken} which will generate a	A32	Token=atm Token={GeneratedToken}	

Keyword	Definition and Value	Format	Example	Notes
	unique 32-byte value for the ATM.			
Password=	Password for the user ID.	A32	Password=atman	
WaitTime=	During the specified time, the Attach Manager waits for a response. After expiration of the time, the Attach Manager receives a timeout. This is used as the WAIT time on the ATM's RECEIVE call.	A8	WaitTime=5M	Identical to Broker control block WAIT parameter. Default=60S.
RecvLength=	Size of the buffer that is available for receiving orders.	I4	RecvLength=12000	Identical to Broker control block RECEIVE-LENGTH parameter. Default=8000.
HistoryFile=	File name for logging orders that have been received for restarting. If this keyword is not specified, no file is written. This can be any valid file name.	Valid path name for dependent platform. See example.	HistoryFile=%TEMP%\Default.his	
HistoryFileMode=	When starting the Attach Manager, you can decide here whether the current file is to be overwritten or not.	w or a+t	HistoryFileMode=w	File is newly opened for writing; the old file is deleted.
			HistoryFileMode=a+t	Writing of the old file is continued.
LogFile=	Log information is logged here about the current status of the Attach Manager. If this keyword is not specified, no file is written.	Valid path name for dependent platform. See example.	LogFile=%TEMP%\Default1.log	
LogFileMode=	When starting the Attach Manager, the administrator can decide whether the current file is to be overwritten or not. The file can get very large.	w or a+t	LogFileMode=w	File is newly opened for writing; the old file is deleted.
			LogFileMode=a+t	Writing of the old file is continued.
Sleep=	If the Attach Manager cannot register successfully during	I4	Sleep=120	

Keyword	Definition and Value	Format	Example	Notes
	startup, or if a connection is broken, the Attach Manager waits this specified time in seconds and then tries again. You can limit the number of connection attempts, using the keyword <code>Retries=n</code> .			
<code>Retries=</code>	If registration fails, the number of subsequent registration attempts can be limited. the keyword <code>Sleep</code> determines the wait time before a new registration attempt. Setting <code>Retries=0</code> deactivates this functionality.	I4	<code>Retries=0</code>	Default=0.
<code>ShutdownBy UserRequest=</code>	When set to 1, the ATM can be stopped when a command is sent to it to shut down. If it is set to zero, it will restart automatically.		Values:  0 Attach Manager restarts. The configuration file is read anew. 1 Attach Manager terminates itself.	

### Parameters of the Service List Section

This section names the Service sections that will be used to define the services that will be attached. The prefix of the name of the section must match a specific instance of the `AttachManager(n)` sections.

Example: Assume there are three services to be attached. They can be logically defined as follows:

```
[Default_Services]
payroll=
inventory=
qualitycontrol=
```

Therefore, there will be three optional sections following: `[payroll]`, `[inventory]`, and `[qualitycontrol]`.

### Parameters of the Service Section

There can be any number of Service sections attached to an ATM by means of its corresponding Service List section. The Service sections are used to define the actual commands that will be issued by ATM to attach servers to respond to Broker requests

The following keywords can be used:

Keyword	Definition	Format	Example
ServerClass= ServerName= Service=	The CLASS/SERVER/SERVICE name of the service to be attached.	A32	ServerClass=AClass ServerName=ASERVER Service=ASERVICE
Min=	The minimum number of servers that should be active. Value must be greater than 0.	I4	Min=3
Max=	The maximum number of servers that should be active.	I4	Max=7
Increment=	The number that should be started when a request is made, up to the number indicated by Max=.	I4	Increment=1
Command=	Command-line command to be issued that will start the service.	Specifies (a) the fully qualified path to the location of the executable to be run and (b) the options for that executable. See example.	Command=c:\server\myservice.exe

Example from table above: If there are no instances of the service ACLASS:ASERVER;ASERVICE REGISTERED, the command indicated in the Command= keyword will be issued three times.

### Sample Configuration File

---

**Note:** A sample configuration file is provided in the `\config` folder of EntireX. This sample defines two ATMs: Default and AttachManager2. The default ATM supports only the services related to Default.

```
[Default]
;
; Specify the broker to which the Attach Manager attaches and
; the channel on which the Attach Manager listens for command
; requests.
;
BrokerID=localhost:1971:TCP
ServerClass=System
ServerName=DefaultMain
Service=Command
UserID=%USERNAME%
Token={GeneratedToken}
Password=Hugo
WaitTime=30s
RecvLength=12000

; Activities will be written to the history file (optional)
HistoryFile=%TEMP%\Default.his
HistoryFileMode=a+t

; Log messages will be written to the log file (optional)
LogFile=%TEMP%\Default.log
; Append to an existing file
; LogFileMode=a+t
; Create a new file
LogFileMode=w

Sleep=10
Retries=0

ShutdownByUserRequest=1

;
;
; Default's services
;
[Default_Services]
AServer=
BServer=
;
[AServer]
ServerClass=AClass
ServerName=ASERVER
Service=ASERVICE
Min=2
Max=3
Increment=1
Command=myservera -c<ServerClass> -s<ServerName> -v<Service> -b<BrokerID> -i500
;
[BServer]
ServerClass=BCLASS
ServerName=BSERVER
```

```
Service=BSERVICE
Min=1
Max=1
Increment=1
Command=myserverb -c<ServerClass> -s<ServerName> -v<Service> -b<BrokerID> -i750
[AttachManager2]
;
; Specify the broker to which the Attach Manager attaches and
; the channel on which the Attach Manager listens for command
; requests.
;
BrokerID=localhost:1971:TCP
ServerClass=System
ServerName=AttachManager2Main
Service=Command
UserID=%USERNAME%
Token={GeneratedToken}
Password=Hugo
WaitTime=30s

## Operating the Attach Manager

---

Under normal circumstances, no manual operation is not necessary if the default ATM satisfies your needs. However, if you need to run multiple ATMs in your environment, this section describes how to perform the necessary operations.

- [Starting the Attach Manager](#)
- [Stopping the Attach Manager](#)
- [Logging the Attach Manager](#)
- [Attach Manager Processing](#)

### Starting the Attach Manager

#### ➤ To start an Attach Manager

- Either from the *bin* directory of EntireX (or from any directory if the *bin* directory is in the PATH), enter the following command:

```
exxatm -F<full-path of Configuration file> -N<AttachManager1> -N<AttachManager2> ↵  
...
```

#### Notes:

1. With the `-N` argument you specify the ATM section for which the Attach Manager is responsible for. If this argument is omitted the attach manager is responsible for the default section.
2. With the `-F` argument you specify the location of the configuration file. If this argument is omitted, the Attach Manager uses the default configuration file. All ATM instances should use the same configuration file, so we recommend you use the default file for the default ATM.
3. The Attach Manager writes output to stdout. If you start the Attach Manager as a background process, stdout must be redirected to a file.

### Stopping the Attach Manager

#### ➤ To stop an Attach Manager

Each attach manager corresponds to an particular broker and registers a command service defined with the configuration variables `ServerClass/ServerName/Service` in the ATM section.

- Use the command-line utility `etbcmd`.

Or:

Press **CTRL-C**.

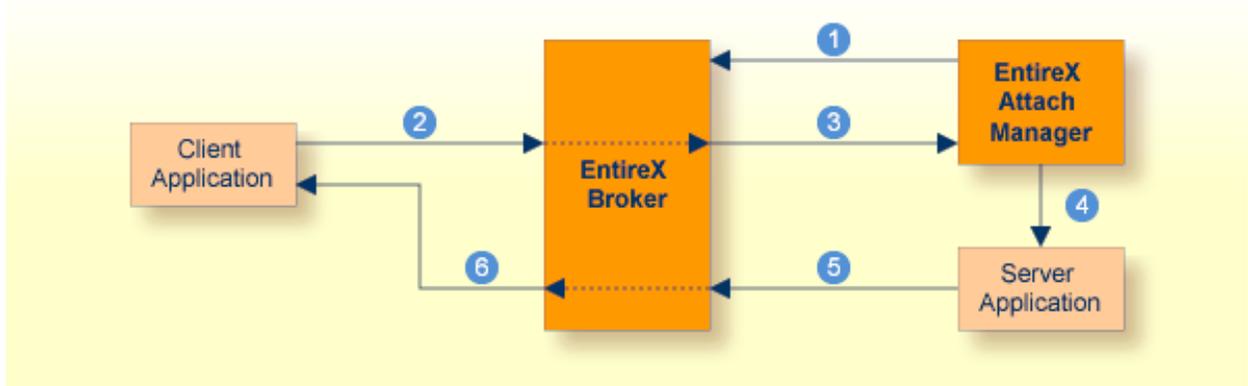

### Logging the Attach Manager

The ATM log file is defined by the ATM configuration parameter `LogFile`. If the Attach Manager is launched automatically, it writes additional log information to file `exxatm.out` in the EntireX subdirectory `config\etb\ETBSRV`.

In addition to the ATM log file, a history file is defined by the ATM configuration parameter `HistoryFile`. For each order to launch a service, the ATM writes a record into the history file. The history record has the following format:

- date and time
- the service name as defined in the ATM config file
- server name, server class and service
- number of active replicates (this number is greater than 0 only if all running replicates are busy while a new client requests the service)
- number of server lookups, that is, the number of clients requesting a new replicate of the server; this is greater than 1 only if two clients request a service in parallel
- replicate increment as defined in the ATM config file
- number of replicates actually launched; this differs from the increment only if the high watermark is exceeded

## Attach Manager Processing

- 1 Attach Manager registers with Broker, indicating that it will attach named services. These are called attach-managed services.
- 2 Client requests a service that is attach-managed. Server may or may not be active. If it is not, a server will be started (attached).
- 3 Attach request comes from the Broker.
- 4 Attach Manager issues command to start the server application.
- 5 Server application issues a LOGON to the Broker, then issues REGISTER and RECEIVE. It gets message from client, processes the message, and responds.
- 6 Response from server is received by the client application.

---

# 12      Setting up and Administering the EntireX Broker TCP

## Agent

---

▪ Common Scenarios .....	162
▪ Indirect TCP/IP Connections by the TCP Agent to Avoid Security Restrictions .....	163
▪ Using the TCP Agent .....	163
▪ Activating Tracing for the TCP Agent .....	164
▪ Architecture of the Broker TCP Agent .....	165

The EntireX Broker TCP Agent is a gateway to the broker whenever direct TCP/IP communication with the broker is not possible. Under Windows, use the delivered batch file `<drive>:\Software-AG\EntireX\EntireX\bin\brokeragent.bat` to start the agent.

## Common Scenarios

---

The most common scenarios for using the Broker TCP Agent are where the Java security manager does not allow direct communication with the Broker. For example, an untrusted Java applet can only open a TCP/IP connection to a Broker which is running on the same machine as the Web server.

Although in most cases the Broker TCP Agent will be used from a Broker application written in Java, the Broker TCP Agent can also be used from any component or application configured with TCP/IP.

## Indirect TCP/IP Connections by the TCP Agent to Avoid Security Restrictions

The Broker TCP Agent must be used when the Java client cannot open a TCP/IP connection to the EntireX Broker due to security or firewall settings. The most prominent case is the Java sandbox model, which permits a Java applet to open only TCP/IP connections to the machine where the Web server resides. If the EntireX Broker is running on a different machine, a TCP Agent has to be run on the Web server machine.

### Using the TCP Agent

#### Class Name and Parameters

The Broker TCP Agent is a standalone Java application. The class name which contains the `main` method is `com.softwareag.entirex.ba.BrokerAgent`.

Specify the following parameters in the order given in this table when the TCP Agent listens on a TCP/IP port:

Parameter	Explanation
1. Trace Option	Valid values: ON or OFF. Default: OFF. A dump of the buffers is written to standard output for diagnostic purposes.
2. Port Number	The port number the TCP Agent uses for incoming requests from Broker applications. This port number must be specified as part of the Broker ID in the Broker application.
3. Broker Address	The TCP Agent sends all requests to this Broker using any legal Broker ID defined with <i>URL-style Broker ID</i> . The TCP Agent will use direct TCP/IP communication if the TCP/IP protocol is used (the address is of the form <code>Hostname, Hostname: Number</code> or starts with <code>tcpip://</code> ).
4. Bind Address	The address of the network interface on which the Broker TCP Agent will listen for connection requests. The default is that the Broker Agent will listen on any attached interface adapter of the system. The bind address is the local IP address or host name to bind to.

## Starting the TCP Agent

Under Windows, the EntireX distribution kit comes with a batch file to start the Broker TCP Agent. Change the port number and the Broker address in file `<drive>:\SoftwareAG\EntireX\EntireX\bin\brokeragent.bat`.

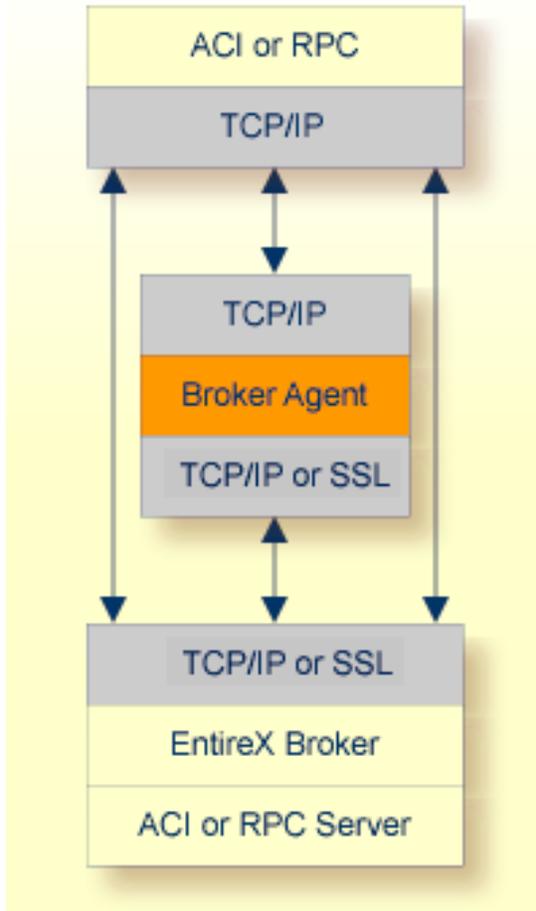

## Activating Tracing for the TCP Agent

---

Set the parameter Trace Option to "ON". See [Class Name and Parameters](#).

## Architecture of the Broker TCP Agent

The architecture of the Broker TCP Agent is shown in the following picture:

---

# 13      Setting up and Administering the EntireX Broker SSL

## Agent

---

▪ Common Scenarios .....	168
▪ Using the Broker SSL Agent .....	168
▪ Activating Tracing for the Broker SSL Agent .....	169
▪ Architecture of the Broker SSL Agent .....	169

The EntireX Broker SSL Agent is a gateway to the broker whenever direct SSL/TLS communication with the broker is not possible. Under Windows, use the delivered batch file `<drive>:\Software-AG\EntireX\EntireX\bin\sslbrokeragent.bat` to start the agent.

## Common Scenarios

---

The most common scenarios for using the Broker SSL Agent are where direct SSL communication to the Broker is not possible or it is not required by the network architecture.

Although in most cases the Broker SSL Agent will be used from a Broker application written in Java, the Broker SSL Agent can also be used from any component or application configured with SSL. See *Using SSL/TLS with EntireX Components*.

## Using the Broker SSL Agent

---

### Class Name and Parameters

The Broker SSL Agent is a standalone Java application. The class name is `com.softwareag.entirex.ba.SSLBrokerAgent`.

Specify the following parameters in the order given in this table when the Broker SSL Agent listens on an SSL port:

Parameter	Explanation
1. Trace Option	Valid values: ON or OFF. Default: OFF. A dump of the buffers is written to standard output for diagnostic purposes.
2. Port Number	The port number the Broker TCP Agent uses for incoming requests from Broker applications. Specify this port number as part of the broker ID in the broker application.
3. SSL Parameters	SSL parameters when the Broker SSL Agent runs as an SSL server. SSL requires a (server) certificate with a private key. Specify with <code>key_store=filename</code> the file name of a Java keystore that contains the private key. SSL client authentication can be requested with the parameter <code>verify_client=yes</code> . In this case, specify with <code>trust_store=filename</code> the file name of a Java keystore containing the list of trusted certificate authorities that issued the client's certificate. The complete list of parameters could be <code>key_store=keystore&amp;verify_client=yes&amp;trust_store=castore</code> . Examples: <code>key_store=ExxJavaAppCert.jks trust_store=ExxCACert.jks</code> . See also <i>SSL/TLS Parameters for Broker as SSL Server (One-way SSL)</i> .
4. Password	The password which protects the private key. If the value <code>-prompt</code> is specified the password is read from standard input.

Parameter	Explanation
5. Broker Address	The Broker SSL Agent sends all requests to this Broker using any legal Broker ID defined with <i>URL-style Broker ID</i> . The Broker SSL Agent will use SSL communication if the SSL protocol is used (the address starts with <code>ssl://</code> ).
6. Bind Address	The address of the network interface on which the Broker SSL Agent will listen for connection requests. The default is that the Broker Agent will listen on any attached interface adapter of the system. The bind address is the local IP address or host name to bind to.

### Starting the Broker SSL Agent

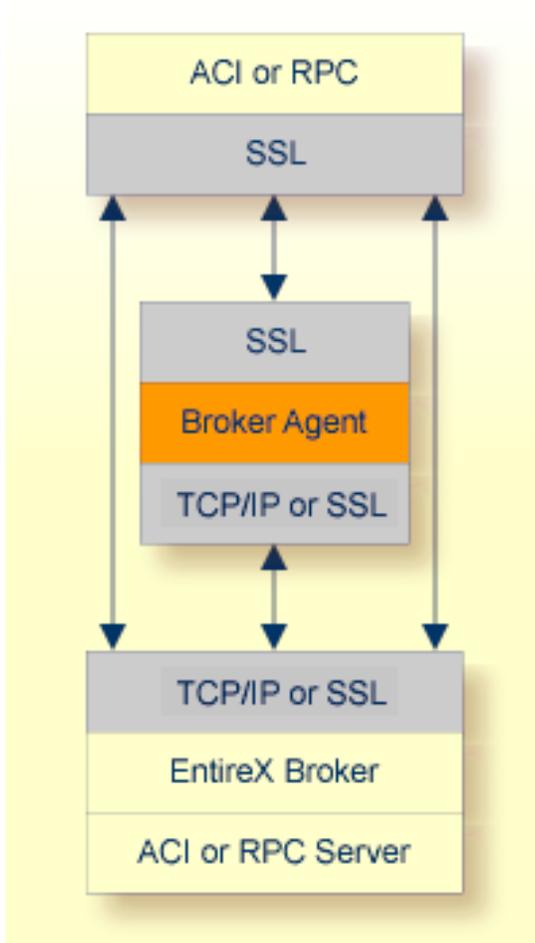

Under Windows, the EntireX distribution kit comes with a batch file to start the Broker SSL Agent. Change the port number, the Broker address and the SSL parameters in file `<drive>:\SoftwareAG\EntireX\EntireX\bin\sslbrokeragent.bat`.

### Activating Tracing for the Broker SSL Agent

Set the parameter Trace Option to "ON". See [Class Name and Parameters](#).

### Architecture of the Broker SSL Agent

The architecture of the Broker SSL Agent is shown in the following picture:

# 14      Setting up and Administering the EntireX Broker HTTP(S)

## Agent

---

- HTTP(S) Tunneling with EntireX ..... 172
- Configuring the Broker HTTP(S) Agent ..... 173
- Using Internationalization with the Broker HTTP(S) Agent ..... 175
- Activating Tracing for the Broker HTTP(S) Agent ..... 175

The EntireX Broker HTTP(S) Agent is a Java-based component that implements a Java servlet for servlet-enabled Web servers. It builds the bridge between a Web server and EntireX Broker in the intranet. This component was formerly referred to as “Tunnel Servlet”.

## HTTP(S) Tunneling with EntireX

---

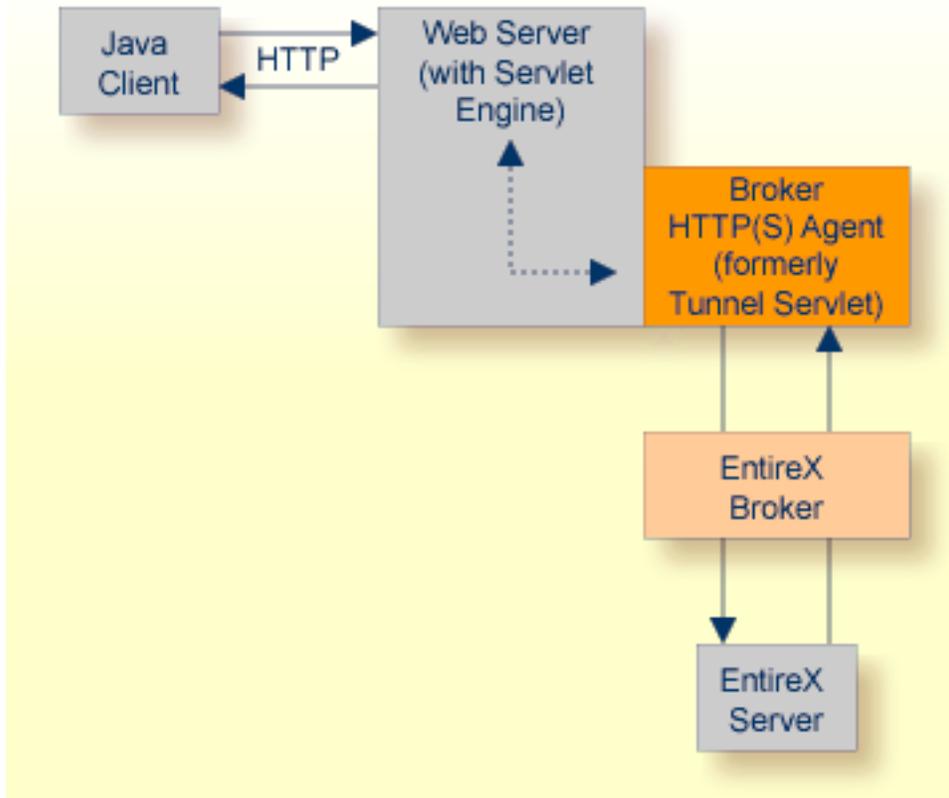

### Introduction

When communicating with EntireX Broker over the internet, direct access to the EntireX Broker's TCP/IP port is necessary. This access is often restricted by proxy servers or firewalls. With EntireX, Java-based communication components can pass communication data via HTTP or HTTPS. This means a running EntireX Broker in the intranet is made accessible by a Web server without having the need to open additional TCP/IP ports on your firewall (HTTP tunneling). HTTP or HTTPS tunneling can also be used for Java RPC.

### How the Communication Works

The EntireX Java ACI is able to send and receive data via an HTTP protocol controlled by constructor `com.softwareag.entirex.aci.Broker`. See *How to Enable HTTP Support in a Java Component* under *Writing Advanced Applications - EntireX Java ACI*.

The EntireX Java component `com.softwareag.entirex.aci.TunnelServlet.class` implements a Java servlet for servlet-enabled Web servers. It builds the bridge between Web server and EntireX Broker in the intranet.

The figure above shows how the communication works. In this scenario, a Java client program communicates via HTTP and EntireX Broker with an EntireX server. By using a Broker ID starting with http:// (passing the URL of the installed Broker HTTP(S) Agent) each Broker request is sent to a Web server, which immediately processes the Broker HTTP(S) Agent, passes the contents to EntireX Broker, receives the response and sends it back via HTTP. For the two partners (client and server) it is transparent that they are communicating through the Web. Java server programs can also communicate via HTTP if necessary.

## Configuring the Broker HTTP(S) Agent

To use the Broker HTTP(S) Agent you need a servlet-enabled Web server.

Parameter	Description
broker	The broker you want to address (syntax: as Broker ID in Java).
log	<b>Yes</b> Default. Servlet writes logging information to its standard output.
	<b>No</b> No log is created.

In the following, “tunnel” is used as the agent name.

➤ **To adapt the Broker HTTP(S) Agent**

The following steps describe the deployment with the Web archive *entirex.jar* in detail. You can test the Broker HTTP(S) Agent with `http://<host>:<port>/entirex/tunnel`, where *entirex* is the name of the Web application.

- 1 Create the new subfolders in the Web application directory of your Web server, e.g. *tunnel*, *tunnel/WEB-INF*, *tunnel/WEB-INF/lib*.
- 2 Copy the *entirex.jar* into *tunnel/WEB-INF/lib*.
- 3 Create a file named *web.xml* in the folder *tunnel/WEB-INF* with the following content:

```
<web-app>
  <servlet>
    <servlet-name>tunnel</servlet-name>
    <servlet-class>com.softwareag.entirex.aci.TunnelServlet</servlet-class>
    <init-param>
      <param-name>broker</param-name>
      <param-value>yourbroker</param-value>
    </init-param>
    <init-param>
      <param-name>log</param-name>
      <param-value>yes</param-value>
    </init-param>
  </servlet>
  <servlet-mapping>
    <servlet-name>tunnel</servlet-name>
    <url-pattern>/*</url-pattern>
  </servlet-mapping>
</web-app>
```

- 4 Restart your Web server and test the installation by calling the Broker HTTP(S) Agent in your Web browser. The URL is: `http://<yourhost>/tunnel`. If the agent is installed properly, an information page is displayed.
- 5 Run either the RPC *CALC* example or the *bcoc/bcos* broker verification.
  - To run the RPC *CALC* example, see the relevant section for Natural | COBOL | PL/I | RPG and also *EntireX IDL Tester* in the EntireX Workbench documentation
  - To use the *bcoc/bcos* verification, see *Sample Programs for Client (bcoc) and Server (bcos)* in the z/OS | UNIX | Windows installation documentation or *Verifying the Installation of the EntireX Broker (z/VSE | BS2000)*.

## Using Internationalization with the Broker HTTP(S) Agent

---

Character conversion is transparent for the Broker HTTP(S) Agent. The client sending the EntireX ACI request with HTTP over the Web server through the Broker HTTP(S) Agent fully controls its encoding. No configuration is necessary for the Broker HTTP(S) Agent.

## Activating Tracing for the Broker HTTP(S) Agent

---

### ➤ To switch on tracing for the Broker HTTP(S) Agent

- Set the system property `entirex.trace` to one of the values 1, 2, or 3. See *Tracing*.

### ➤ To switch on logging

- Set the configuration parameter `log=yes`.

This logs the parameters from the HTTP header, the HTTP messages and error messages to the logging facility of the Web server.

---

# 15

## Running an EntireX RPC Server as a Windows Service

---

■ Introduction .....	178
■ Sample Installation .....	179
■ EntireX RPC Service Tool .....	180
■ Customizing the Service .....	183
■ Removing the Service .....	183
■ Tracing for the Windows Service .....	183
■ Starting an RPC server Using the Service .....	184
■ Stopping an RPC server Using the Service .....	184
■ Running with EntireX Security .....	184
■ Windows-specific Folders .....	185

**Note:**

This chapter describes how to run an EntireX RPC server using a batch script. Since EntireX version 10.1 you can perform this task using Command Central. See

- parameter `install.service` of the Command Central command-line (C | .NET | IMS Connect | Java | IBM MQ | SOAP/XML)
- checkbox **Register Windows service for automatic startup** of the Command Central GUI (C | .NET | IMS Connect | Java | IBM MQ | SOAP/XML)

## Introduction

---

Any EntireX RPC server can be run as a Windows service. This has the following advantages:

- The server is started automatically when the PC is booted and shut down automatically when the PC is shut down.
- The service can be run under a system account that has different rights on a PC than the user account.
- The service can be run under any valid user ID.
- The Control Panel provides an overview of started servers and their status.

To run an RPC server as a Windows service, a batch script (.bat) that can start the RPC server is required. Sample batch scripts are provided in the EntireX *bin* folder:

- `microfocusservice.bat`
- `cserver.bat`
- `cicseciservice.bat`
- `imsconnectservice.bat`
- `dotNetServer.bat`
- `jrpservice.bat`
- `xmlrpcservice.bat`
- ...

To install RPC server as windows services, use the EntireX RPC Service Tool. Multiple services can be installed if more than one RPC server is required.

## Sample Installation

The steps below use the RPC Server for C as an example. In a similar way the information applies to other RPC servers. See *Running an EntireX RPC Server as a Windows Service* .

### ➤ To install an RPC Server as a Windows Service

- 1 Enter the EntireX installation directory and copy file *EntireX\bin\RPCService.bat*. Save the file under a different name, for example *EntireX\bin\RPCService\_C.bat*.

The EntireX installation directory is specified during installation. Later on when registering the service, the argument value of parameter `-ext` of `rpcservice.exe` must correspond with this extension, for example `-ext C`.

The extension `_C` will later correspond with the argument in parameter `-ext` when registering the service using `rpcservice.exe`. Also the name of the service will be extended by this value. This is needed to distinguish multiple server instances.

- 2 Modify batch file *RPCService\_C.bat* and uncomment the line where the RPC Server for C start script file is referenced.

```
cserver.bat %*
```

The file contains entries for various RPC servers. The RPC Server for C is already uncommented, it is the default.

Make sure the referenced start script (*cserver.bat* for the RPC Server for C) considers the notes given under *Running an EntireX RPC Server as a Windows Service* . For the RPC Server for C, this is the option `-silent` and the feature to pass external parameters to the RPC server:

```
rpcserver CFG=..\config\cserver.cfg -s %*
```

- 3 Adapt the corresponding configuration file, for example `\EntireX\config\cserver.cfg`, to your needs.
- 4 Optionally test whether the server is configured correctly before registering it as a Windows service by entering the following from a command prompt:

```
RPCService_C.bat
```

- 5 Register the Server as a Windows service. Enter:

```
rpcservice.exe -install -ext C -serverlog c:\serverlog.txt -trace  
c:\servertrace.txt -script c:\SoftwareAG\EntireX\bin\RPCservice_C.bat
```

where `c:\SoftwareAG` is the installation directory,

<code>-ext</code>	must correspond with the extension specified in step 1
<code>-serverlog</code>	is optional
<code>-trace</code>	is optional
<code>-script</code>	must point to file <i>RPCservice_C.bat</i> created in step 1

## EntireX RPC Service Tool

---

The EntireX RPC Service Tool is provided to install, remove, start and stop RPC services. An overview screen “Software AG EntireX RPC Service” lists the available arguments and options.

### Displaying the available Arguments and Options

#### ➤ To display the overview screen

- In the command line, go to the EntireX *bin* directory and enter:

```
rpcservice.exe -help
```

The following screen is displayed:

```
Software AG EntireX RPC Service (V.n.n.n)
Service Tool to start/stop RPC servers
(c) Copyright Software AG 1997-20nn. All rights reserved.
-----

Usage:
rpcservice -install      [options]    to install the service
rpcservice -remove      [options]    to remove the service
rpcservice -help        [options]    prints this panel

Options:
  [-ext[ension]         <extension>    use a service extension
  [-script              <path\script>   set the server startup file
                                     for this service
  [-serverlog          <path\logfile>   set the communication file
                                     between server and service
  [-userid             <userid>        set userid for broker logon
  [-password           <password>     set password for broker logon
  [-trace              [<tracefile>]]  used for diagnostics
```

## Explanation of Options

### ■ No option

This will install a service displayed as “Software AG EntireX RPC Service”. The service is registered as EXXRPCService (Service name under Properties). Required suboptions will be set to their defaults.

### ■ **-extension** <ext>

use this option to add an extension to the service to differentiate it from other instances, if you want to install multiple RPC service instances. The service will be displayed as “Software AG EntireX RPC Service [<ext>]”. The default log file *RPCservice\_<ext>.log*. will be added.

 **Important:** If you use this option, the program will by default search for a script with the same extension, *RPCService\_<ext>.bat*. Make sure it exists.

Example:

- For an RPC Server for Java you can use

```
-install -ext java -script <EntireX bin directory>\jrpcserver.bat
```

The service will be displayed as Software AG EntireX RPC Service [java], the log file will be called *RPCservice\_java.log*.

- For an RPC Server for XML/SOAP you can use

```
-install -ext xml -script <EntireX bin directory>\jxmlrpcserver.bat
```

The service will be displayed as Software AG EntireX RPC Service [xml], the log file will be called *RPCservice\_xml.log*.

- For an RPC Server for Micro Focus you can use:

```
-install -ext MicroFocus -script <EntireX bin directory>\microfocusserver.bat
```

The service will be displayed as Software AG EntireX RPC Service [MicroFocus], the log file will be called *RPCservice\_MicroFocus.log*.

- For an RPC Server for C you can use:

```
-install -ext C -script cserver.bat
```

The service will be displayed as Software AG EntireX RPC Service [C], the log file will be called *RPCservice\_C.log*.

Default: none.

■ **-script**

use this option to specify a batch script other than the default scripts *RPCService.bat* or *RPCService\_<ext>.bat*.

**Important:** The script file must pass external parameters to the RPC server. Please make sure that `%*` remains at the end of the line that contains the RPC server call, so that parameters coming from the Windows Service are passed to the RPC server:

```
rpcserver.exe "cfg=..\config\server.cfg"%*
```

Default: `<EntireX-installation>\bin\RPCService.bat`

or, if `-ext <ext>` is applied:

`<EntireX-installation>\bin\RPCService_<ext>.bat`

■ **-serverlog**

We recommend that you do not change the name of this file.

Default: `CSIDL_LOCAL_APPDATA\Software AG\EntireX\RPCservice.log`

or, if `-ext <ext>` is applied:

`CSIDL_LOCAL_APPDATA\Software AG\EntireX\RPCservice_<ext>.log`

`CSIDL_LOCAL_APPDATA` is resolved at runtime according Microsoft's policy for user and application repositories. See [Windows-specific Folders](#).

■ **-userid and -password**

use these options if your target Broker requires EntireX Security.

These options are obsolete from EntireX versions 8.2 SP1. RPC servers communicate their user ID/password credentials via the server log file if required by EntireX Security. See [Running with EntireX Security](#). The options are still supported for compatibility with earlier versions or if the user ID and password of the RPC service have to be different from those of the RPC server(s). If the user ID and password are applied in this RPC service (and are different from the default), these values take precedence over the credentials that may be supplied by the RPC server(s).

Defaults:

User ID: ERX-USER

Password: PASSWORD

**Note:** This service requires the `broker.dll`. Make sure that when the service is executing under the control of the Windows Service Manager it can access the `broker.dll` in the standard path definitions or in the EntireX installation directory.

## Customizing the Service

---

You can set the service to start the RPC server automatically or manually.

➤ **To customize the service**

- 1 Go to **Control Panel > Administrative Tools > Services** and select the service and then **Properties**.
- 2 Set the Startup type as desired or
- 3 Start/stop the service as desired.

## Removing the Service

---

➤ **To remove the service**

- In the command line, go to the EntireX *bin* folder and enter:

```
rpcservice.exe -remove [-ext[ension] <extension>]
```

## Tracing for the Windows Service

---

Use the `-trace` option with the individual commands.

- with `-install`

The trace option will be stored in the System Registry and tracing will be enabled if the service is started/stopped by the Service Manager. It can only be switched off by removing the service.

- With the other commands trace runs as long as the command takes to finish its task.
- You can specify a target log file. By default the file is written to the Windows folder for user documents. See [Folder for User Documents](#).

## Starting an RPC server Using the Service

---

If the startup type for the service is set to automatic, the server will be started when the PC is booted.

### > To start the server manually

- Go to **Control Panel > Administrative Tools > Services** and select the service, then **Properties** and choose **Start**.

## Stopping an RPC server Using the Service

---

If you selected startup type automatic in the service properties, the server will be stopped by the operating system when the PC is shut down.

### > To stop the server manually

- Use the service, go to **Control Panel > Administrative Tools > Services** and select the service, then **Properties** and choose the **Stop** button.

If you choose to stop the server using the EntireX utilities, the Windows service will change the status from “running” to “stopped” and writes a warning message in the event log that the EntireX server has stopped for an unknown reason.

## Running with EntireX Security

---

### Starting an RPC server running under EntireX Security

To start an RPC server, supply a valid user ID and password to log on to the broker. The ID and password are applied to the configuration of the individual RPC server(s).

## Stopping an RPC server running under EntireX Security;

When you stop an RPC server, the RPC service uses the user ID/password from the credentials provided by the new RPC server(s), if applied. Otherwise user ID and password may be taken from the RPC service installation options (see above).

**Note:** Broker command service `etbcmd` is used to stop the broker. See *Broker Command and Information Services*. This means that users who can start RPC servers to certain broker services also need access rights to `Class=SAG, Server=ETBCIS, Service=*`.

## Windows-specific Folders

---

### Folder for Application Data

The file system directory that serves as a common repository for application-specific data.

A typical path is *C:\Documents and Settings\username\Application Data*.

Under Windows 7, this path for the SYSTEM user might resolve to:  
"C:\Windows\System32\config\systemprofile\AppData\Local".

### Folder for Local (Non-roaming) Application Data

The file system directory that serves as a data repository for local (non-roaming) applications.

A typical path is *C:\Documents and Settings\username\Local Settings\Application Data*.

### Folder for User Documents

The file system directory used to physically store a user's common repository of documents.

A typical path is *C:\Documents and Settings\username\My Documents*.

See [MSDN Library](#).

# 16 Tracing webMethods EntireX

---

▪ Table Summarizing Tracing for webMethods EntireX Components .....	188
▪ Tracing EntireX Broker .....	189
▪ Tracing Broker Agent .....	191
▪ Tracing Broker Stubs .....	191
▪ Tracing EntireX Java ACI .....	192
▪ Tracing RPC Server for Java .....	193
▪ Tracing the RPC Runtime .....	193
▪ Tracing the XML/SOAP Runtime .....	195
▪ Tracing the EntireX RPC-ACI Bridge .....	199

This chapter describes the various techniques available for troubleshooting, tracing and logging with EntireX components.

**Note:** Trace files can contain sensitive personal data (user ID, IP address, SSL certificates and payload data). This is particularly relevant if you have activated EntireX Security. EntireX uses trace files for accounting, diagnostics and error analysis. We recommend you check the different trace opportunities provided by EntireX and delete trace files if they are no longer needed. The various EntireX components will not delete these trace files automatically; this is your responsibility as user. Use the appropriate tools of the respective operating system.

## Table Summarizing Tracing for webMethods EntireX Components

EntireX Component	Use Tracing Technique for	Tracing Technique
Broker ActiveX Control	Transport-related problems Requests to, replies from the Broker or Broker Agent	<a href="#">Tracing Broker Stubs</a>
EntireX Broker ACI under Windows	Transport-related problems Requests to, replies from the Broker or Broker Agent	<a href="#">Tracing Broker Stubs</a>

## Tracing EntireX Broker

### ➤ To switch on tracing

- Set the attribute TRACE - LEVEL in the broker attribute file
  - for minimal trace output to "1"
  - for detailed trace output to "2"
  - for full trace output to "3"

Example:

```
TRACE-LEVEL=2
```

➤ **To switch off tracing**

- Set the attribute `TRACE-LEVEL` in the broker attribute file to 0:

```
TRACE-LEVEL=0
```

Or:

Omit the `TRACE-LEVEL` attribute.

➤ **To view the contents of a log**

- Using Command Central, select an environment in the **Environments** pane, select the **Instances** tab, click the name of a product instance, select the **Logs** tab, click the log alias for a log in the **Alias** column.

Or:

Enter the following command in Command Central:

```
sagcc get diagnostics logs
```

This retrieves log entries from a log file. Log information includes the date, time, and description of events that occurred with a specified runtime component.

See *Administering EntireX Components with Command Central* in the EntireX documentation or the separate Command Central documentation and online help for details.

## Trace Output

The trace file, *BrokerID.LOG*, is written to the *Broker Directory*.

## Related Information

*EntireX Broker Return Codes*

## Tracing Broker Agent

---

### > To switch on tracing

- Set the parameter Trace Option to ON. For the complete table of parameters, see [Using the Broker SSL Agent](#) and [Using the TCP Agent](#).

### > To switch off tracing

- Set the parameter Trace Option to OFF.

Or:

Omit the parameter Trace Option.

### Trace Output

The trace output is written to STDOUT.

## Tracing Broker Stubs

---

The broker stubs provide an option for writing trace files.

### > To switch on tracing for the broker stub

- Before starting the client application, set the environment variable `ETB_STUBLOG`:

Trace Value	Trace Level	Description
0	NONE	No tracing.
1	STANDARD	Traces initialization, errors, and all ACI request/reply strings.
2	ADVANCED	Used primarily by system engineers, traces everything from level 1 and provides additional information - for example the Broker ACI control block - as well as transport information.
3	SUPPORT	This is full tracing through the stub, including detailed traces of control blocks, message information, etc.

Example:

```
ETB_STUBLOG=2
```

If the trace level is greater than 1, unencrypted contents of the send/receive buffers may be exposed in the trace.

Trace output, file `<thread-id>.etb`, is written to the trace directory. The location of the trace file depends on the settings of environment variable `%USERPROFILE%`, for example:

```
C:\Documents And Settings\\My Documents\Software AG\EntireX
```

See *Trace Directory*.

Remember to switch off tracing to prevent trace files from filling up your disk.

➤ **To switch off tracing for the broker stub**

- Set the environment variable `ETB_STUBLOG` to `NONE` or delete it.

## Tracing EntireX Java ACI

---

The EntireX Java ACI provides a system property for tracing.

➤ **To switch on tracing**

- 1 When starting the Java virtual machine, set the Java system property `entirex.trace`
  - for minimal trace output to "1"
  - for detailed trace output to "2"
  - for full trace output to "3".
- 2 The programming interface of the EntireX Java ACI allows you to set the trace value by the Java application using the EntireX Java ACI, see *Tracing* under *Writing Advanced Applications - EntireX Java ACI*. There may also be other methods to provide the trace value. See your application documentation.

➤ **To switch off tracing**

- Set the Java system property `entirex.trace` to 0 when starting the Java virtual machine
- Or:
- Omit the Java system property `entirex.trace` when starting the Java virtual machine.

## Trace Output

The trace output will be written to STDOUT.

## Tracing RPC Server for Java

---

### > To switch on tracing

- When starting the Java virtual machine, set the Java system property `entirex.trace`
  - for minimal trace output to "1"
  - for detailed trace output to "2"
  - for full trace output to "3".

See *Customizing the RPC Server*.

### > To switch off tracing

- Set the Java system property `entirex.trace` to "0" when starting the Java virtual machine.

Or:

Omit the Java system property `entirex.trace` when starting the Java virtual machine.

## Trace Output

The trace output will be written to STDOUT.

## Tracing the RPC Runtime

---

### > To switch on tracing

- Before starting the client application, set the environment variable `ERX_TRACELEVEL` to
  - `STANDARD` for minimal trace output
  - `ADVANCED` for detailed trace output
  - `SUPPORT` for full trace output.

**> To switch off tracing**

- Set the environment variable to NONE or delete it.

**Trace Output**

By default the trace file, *ERXTrace.nnn.log*, will be written to the trace directory.

The value *nnn* can be in the range from 001 to 005.

**> To change the trace destination**

- Set the environment variable `ERX_TRACEFILE` to the desired destination, which can consist of file names, folder names and variables for file names, folder names, process ID, thread ID, range.

The variables are:

Variable	Operating System	Description
%...%	Windows	environment variable
\$(...)	UNIX	environment variable
@PID	UNIX, Windows	process ID
@TID	UNIX, Windows	thread ID
@RANGE[ <i>n,m</i> ]	UNIX, Windows	<i>m</i> must be greater than <i>n</i> , range is from 0 - 999
@CSIDL_PERSONAL	Windows	The user's home directory. The variable will be resolved by Windows shell functions.
@CSIDL_APPDATA	Windows	The <i>Application Data Directory</i> . The variable will be resolved by Windows shell functions.
@CSIDL_LOCAL_APPDATA	Windows	The <i>Application Data Directory</i> . The variable will be resolved by Windows shell functions.

**Related Information**

*Environment Variables in EntireX*

## Tracing the XML/SOAP Runtime

---

This section provides information on tracing the following components:

- EntireX RPC Server for XML/SOAP
- EntireX Listener for XML/SOAP
- EntireX XML/SOAP Wrapper

The following topics are covered:

- [Enabling Tracing](#)
- [Disabling Tracing](#)
- [Configuring a Trace File for the Listener for XML/SOAP](#)
- [Configuring a Trace File for the XML/SOAP Wrapper or the RPC Server for XML/SOAP](#)
- [Trace Parameters](#)
- [Component Names](#)

### Enabling Tracing

There are two ways to switch on tracing mode:

- [Using a Property File](#)
- [Using Trace Parameters of the Java Virtual Machine](#)

### Using a Property File

#### ➤ To switch on tracing mode using a property file

- 1 Copy the trace property file *entirex.trace.standard* to one of the following locations:
  - the working directory of your client application;
  - the user's home directory;
  - any other location.
- 2 Rename the copied file *entirex.trace.properties*.
- 3 Customize *entirex.trace.properties* as described in [Trace Parameters](#).
- 4 If *entirex.trace.properties* is within the current directory of your client application or your user home directory, it will be located automatically.

Otherwise, specify the fully qualified or relative file name when starting the Java virtual machine for your client application using property `entirex.sdk.default.trace.propertiesfile`, example:

```
java -Dentirex.sdk.default.trace.propertiesfile ↵  
="D:/MyDirectory/entirex.trace.properties" MyClient
```

## Using Trace Parameters of the Java Virtual Machine

### ➤ To switch on tracing mode by specifying the trace parameters of the Java virtual machine

- Submit the trace parameters when you start the Java virtual machine for the application to be traced. See [Trace Parameters](#). Note that parameter specifications submitted overwrite settings in the property file.

## Disabling Tracing

### ➤ To switch off tracing

- Delete or rename the trace property file if it is located in the working directory or in the user's home directory.

Or:

Specify `level=NONE` when invoking the Java virtual machine :

```
java -Dentirex.sdk.default.trace.level = NONE MyClient
```

## Configuring a Trace File for the Listener for XML/SOAP

We recommend to add the following parameter in file *conf/axis2.xml* located in the Software AG Common Web Services Stack installation:

```
<parameter name="exx-trace-propertiesfile">file:///path of trace.properties ↵  
file</parameter>
```

Example:

```
<parameter ↵  
name="exx-trace-propertiesfile">file:///D:/MyDir/entirex.trace.properties</parameter>
```

### Notes:

1. If a relative path is specified, the file is located in directory *WEB-INF/conf/* in the Web Services Stack web application file that contains the property.
2. In the parameter section of the file *axis2.xml*, the value of the parameter `exx-trace-propertiesfile` can contain definitions of operating system variables, for example `location="$EXXDIR/config/entirex.trace.properties"`.

## Configuring a Trace File for the XML/SOAP Wrapper or the RPC Server for XML/SOAP

See [Enabling Tracing](#).

**Note:** If the RPC Server for XML/SOAP is running as a service, enable tracing by adding a Java system property to the start script or by copying file `entirex.trace.properties` to the same directory as the start script.

### Trace Parameters

The following table provides an overview of trace parameters, their respective values, and how to submit them as arguments when invoking the Java virtual machine for the component to be traced.

Parameter	Syntax	Description															
propertiesfile	<code>entirex.sdk.component name.trace.propertiesfile= absolute or relative path including the properties file</code>	Provide the location of the <code>entirex.trace.properties</code> file. Only used when the component is started.  <b>Note:</b> A sample trace property file named <code>entirex.trace.standard</code> with predefined trace settings is contained in the directory <code>../EntireX/config</code> . This file is a model and must be renamed to the valid name when used.															
level	<code>entirex.sdk.component name.trace.level = tracelevel</code>	You can specify the following trace levels:  <table border="1"> <thead> <tr> <th>Keyword</th> <th>Level</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>NONE</td> <td>No tracing</td> <td>Tracing is switch off</td> </tr> <tr> <td>STANDARD</td> <td>User</td> <td>Trace invocation of a component.</td> </tr> <tr> <td>ADVANCED</td> <td>Expert</td> <td>For support and diagnostics. Expert knowledge of the component is required.</td> </tr> <tr> <td>SUPPORT</td> <td>Expert</td> <td>Full trace output. Otherwise, as above.</td> </tr> </tbody> </table>	Keyword	Level	Description	NONE	No tracing	Tracing is switch off	STANDARD	User	Trace invocation of a component.	ADVANCED	Expert	For support and diagnostics. Expert knowledge of the component is required.	SUPPORT	Expert	Full trace output. Otherwise, as above.
Keyword	Level	Description															
NONE	No tracing	Tracing is switch off															
STANDARD	User	Trace invocation of a component.															
ADVANCED	Expert	For support and diagnostics. Expert knowledge of the component is required.															
SUPPORT	Expert	Full trace output. Otherwise, as above.															
directory	<code>entirex.sdk.component name.trace.directory = absolute or relative path</code>	Default is the working directory.															
filename	<code>entirex.sdk.component name.trace.filename = FILE STDOUT STDERR</code>	Specify where tracing data is written to:  <table border="1"> <thead> <tr> <th>Keyword</th> <th>Destination</th> </tr> </thead> <tbody> <tr> <td>STDOUT (Default)</td> <td>Console</td> </tr> <tr> <td>STDERR</td> <td>Console</td> </tr> </tbody> </table>	Keyword	Destination	STDOUT (Default)	Console	STDERR	Console									
Keyword	Destination																
STDOUT (Default)	Console																
STDERR	Console																

Parameter	Syntax	Description						
		<p>FILE      File name is generated internally: <i>exx.sdk.component name.threadName.backupNo.log</i>, where <i>backupNo</i> is in the range from ".000" to ".009". Note that the number of files created depends on <i>maximumsize</i>. If more than 10 files are required, the oldest backup file is overwritten.</p>						
threadoriented	<pre>entirex.sdk.component name.trace.threadoriented = true   false</pre>	<table> <thead> <tr> <th>Keyword</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>YES</td> <td>Thread-oriented: trace data is distributed over multiple files (one file per thread)</td> </tr> <tr> <td>NO (Default)</td> <td>Trace data is written to one file.</td> </tr> </tbody> </table>	Keyword	Description	YES	Thread-oriented: trace data is distributed over multiple files (one file per thread)	NO (Default)	Trace data is written to one file.
Keyword	Description							
YES	Thread-oriented: trace data is distributed over multiple files (one file per thread)							
NO (Default)	Trace data is written to one file.							
rowlength	<pre>entirex.sdk.component name.trace.rowlength = maximum_characters_per_row</pre>	Maximum number of characters per row. If this limit is exceeded, the remaining letters are written to a new line.						
maximumsize	<pre>entirex.sdk.component name.trace.maximumsize = max_file_size</pre>	Maximum size of the log file. If this limit is exceeded, the log file is renamed and the remaining data is written to a new log file, see <i>filename</i> . Note that this specification has an effect only if <i>filename</i> is set to "FILE".						
timeframe	<pre>entirex.sdk.component name.trace.timeframe = number of day</pre>	<p>Time period after which the log file is closed. If this time limit has exceeded, the log file is renamed and the remaining data (if any) is written to a new log file. Note that this specification has an effect only if <i>filename</i> is set to "FILE". You can specify the following timeframes:</p> <table> <thead> <tr> <th>Keyword</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>1-9+H</td> <td>Number of hours</td> </tr> <tr> <td>1-9+D</td> <td>Number of days</td> </tr> </tbody> </table> <p>If no time frame is defined, only one log file is used until tracing is stopped.  Example: If timeframe has been set to 30D, the current log file is closed and renamed at midnight every thirty days, and tracing is continued with a new log file.</p>	Keyword	Description	1-9+H	Number of hours	1-9+D	Number of days
Keyword	Description							
1-9+H	Number of hours							
1-9+D	Number of days							

## Component Names

Trace properties given in the trace property file might have to be restricted by *componentname*. The following components are available:

EntireX Component	componentname	Description
	default	The trace property is not restricted to a specific EntireX component.
XML/SOAP Runtime	xml.runtime	The trace property belongs to the EntireX XML/SOAP Runtime only.

## Tracing the EntireX RPC-ACI Bridge

### » To trace Broker calls

- 1 Use the system property `entirex.trace=[0|1|2|3]`.

This trace does not separate the calls to the Broker for RPC from those to the Broker for ACI. The trace levels are:

- 0 to switch off tracing.
- 1 to trace Broker calls.
- 2 to trace Broker calls and the payload.
- 3 to trace Broker calls and all buffers including the payload.

- 2 Redirect the trace to a file with the property `entirex.server.logfile`. Set this to the file name of the log file, the default is standard output.

## EntireX Trace Utility

---

▪ Introduction to the EntireX Trace Utility .....	202
▪ Process Trace .....	202
▪ Show Trace .....	209
▪ Using the EntireX Trace Utility in Batch Mode .....	211
▪ Usage Tips .....	212

## Introduction to the EntireX Trace Utility

---

Broker traces, as well as traces produced from applications communicating with the Broker (so-called "stub traces"), contain a lot of details of the particular Broker calls. However, their layout is different and not easy to understand. The EntireX Trace Utility reads these Broker kernel as well as stub traces and produces a file with a common layout, where one line corresponds to a Broker call. The file layout is a standard CSV file (comma-separated values).

The request (Broker call sent from the stub to the kernel) and the corresponding reply (response sent back from the kernel to the stub) are merged together and presented as one logical Broker call in one row of the output file. Line numbers in the trace file and times for the request and reply are provided. It is also possible to specify filters so only the specified subset of the Broker calls are extracted. Since the Broker trace file contains all activities from both clients and servers and since it is possible to filter the calls, an end-to-end analysis of a conversation is simple to analyze.

The EntireX Trace Utility is divided into two separate elements: Process Trace and Show Trace.

## Process Trace

---

Process Trace is used to process the information contained in the Broker trace file, saving the requested output to a simple text file.

- [Using the Tool](#)
- [Output Field Options](#)
- [Error Messages](#)

### Using the Tool

#### ➤ To open the EntireX Trace Utility under Windows

- 1 Choose "Trace Utility" in your EntireX program group.  
or
- 2 Enter command

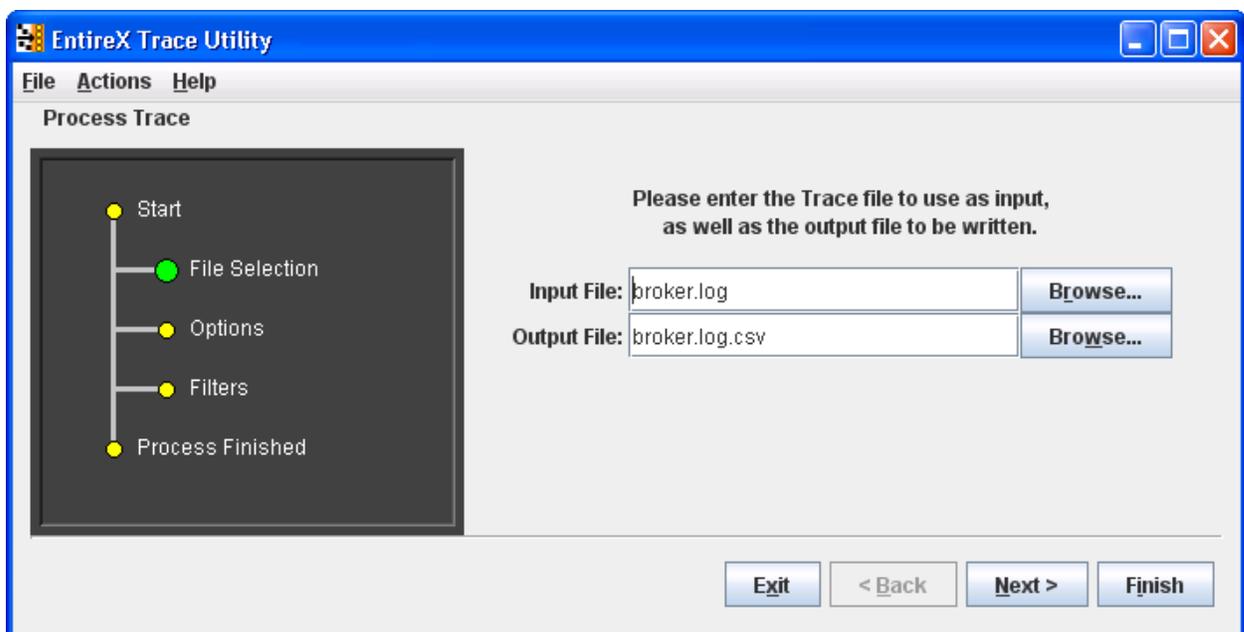

<drive>:\SoftwareAG\EntireX\bin\exxtraceutil.exe

> **To process the trace information**

- Follow the instructions on the following screens:
  - File Selection
  - Options
  - Filters

### File Selection

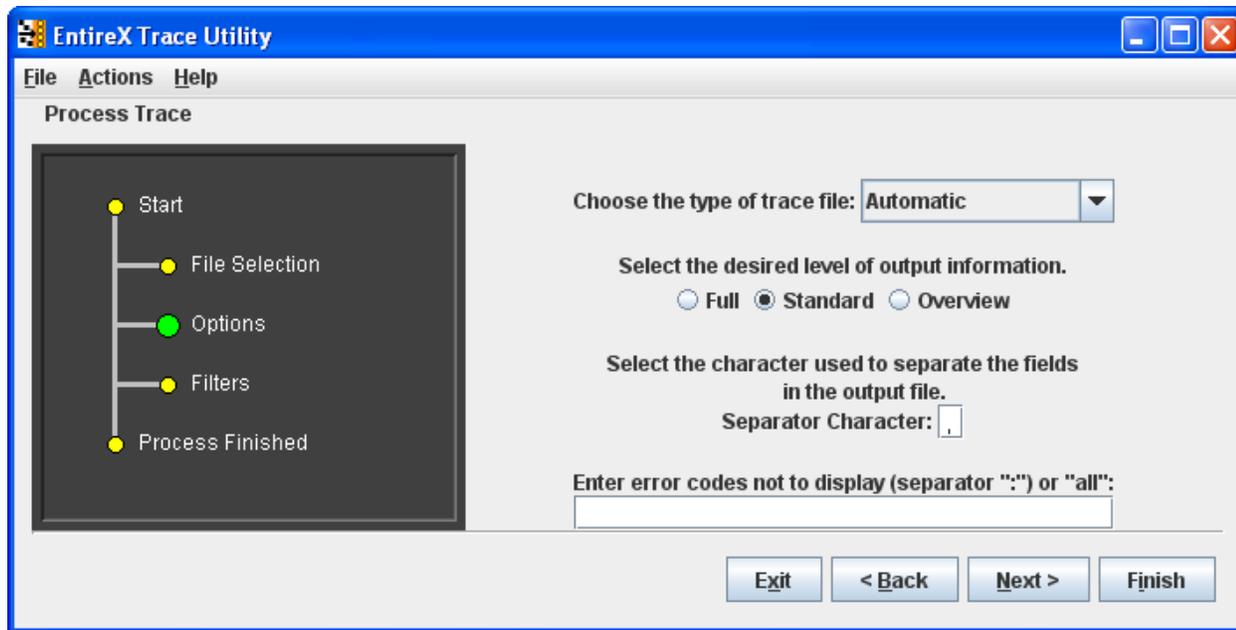

The following window is displayed.

The dark gray display section - the wizard window - shows you which step is required. **File Selection** has a large green dot, so the input and output files are required.

### Options

In the display section, **Options** is green.

See [Output Field Options](#) for information on **Full**, **Standard** and **Overview**.

See [Options](#) under [Using the EntireX Trace Utility in Batch Mode](#) for information on type of trace file and error codes not to display.

The defaults of **Process Trace** are:

- use automatic detection of trace file type
- return the standard amount of output
- save the output fields separated with commas (as this format is needed to be able to view the output in Show Trace)
- display all errors found in the trace file.

The default separator character is ",", you can change this character.

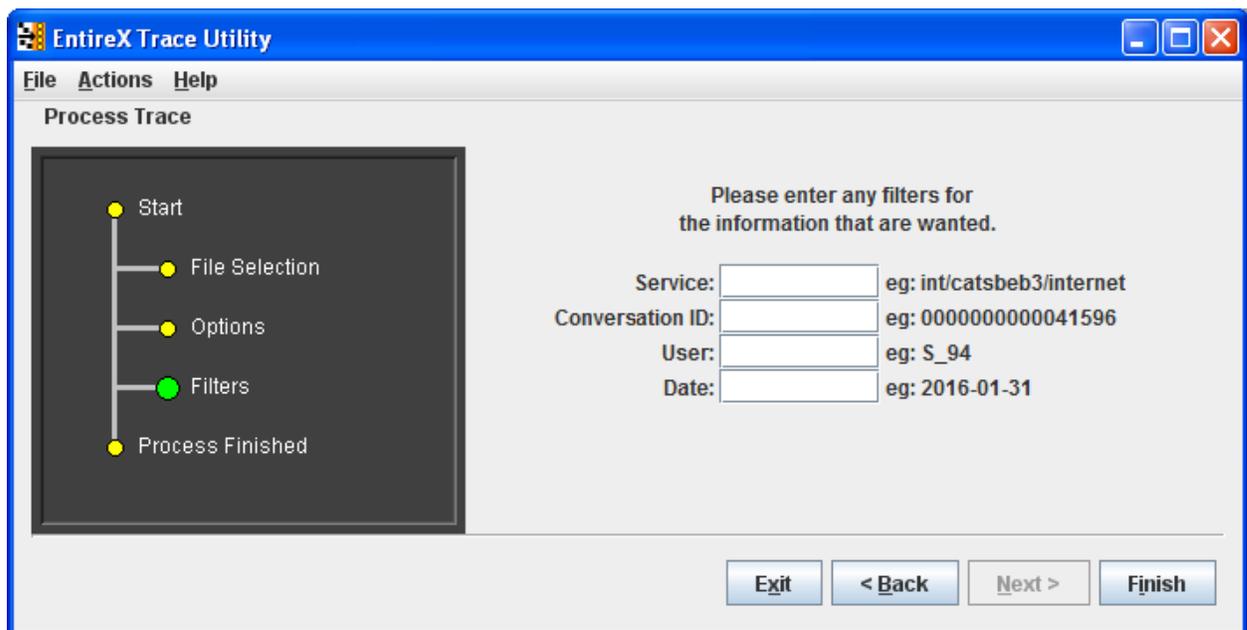

### Filters

For the **Standard** and **Full** output options you can set filters to reduce the amount of information written to the output file.

You can set filters for the **Conversation ID** (for example: 000000000041596), the Broker **Service** (for example: int/catsbeb3/internet), the **User** (for example: S\_94), and the **Date** for the call (for example 2016-01-31).

The **User** filter does not correspond to the User ID or Physical User ID from the trace, but a generated value from **Process Trace**. This filter can only be used after already analyzing an output file and deciding which User to filter for.

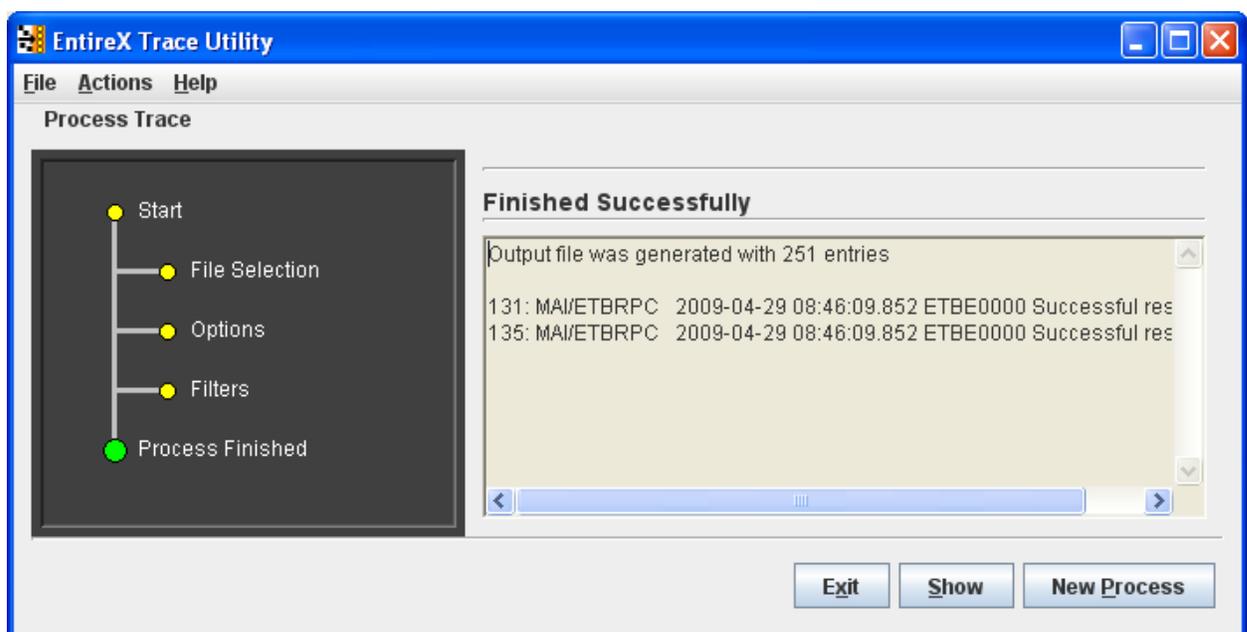

If more than one filter is specified, only those entries that satisfy all conditions will be displayed.

➤ To generate the output file

- Choose **Finish**.

At this point any errors from processing the trace file are shown.

➤ To display the results from the processing

- Choose **Show**.

➤ To leave the program

- Choose **Exit**.

➤ To process another trace file

- Choose **Process Trace** from the menu bar.

A new processing wizard is started.

### Output Field Options

You may select between three levels of output to be written to the output file:

Option	Output Fields
Overview	Phys Userid, Userid, Token, User, Service
Standard	Thread, Req, Reply, Phys Userid, Userid, Token, User, Function, Error, Service, Convid, Uowid, Uowstatus, Slen, Retl, Cuid
Full	Thread, Req, Reply, Phys Userid, Userid, Token, User, Function, Error, Service, Convid, Uowid, Uowstatus, Slen, Retl, Cuid, Time1, Time2, Api, Rlen, Cstat, Charset, SecurityToken, Security, TimeDiff, ReplyTime, Seqid, AppName, Node, Stub, Library, Program, Brokerid, AppMon, Date, MessageIDRequest, CorrelationIDRequest, MessageIDReply, CorrelationIDReply

Description of the columns in the CSV file (comma-separated values).

**Note:** Output which is the result of stub trace files does not contain entries for all columns.

Column	Explanation
Thread	The name of the Java thread executing the Broker call. Only available for trace files produces by the EntireX Java runtime.
Req	The line number in the trace file where the request part of the Broker call starts. 0 if the request cannot be found in the trace file.
Reply	The line number in the trace file where the reply part of the Broker call starts. 0 if the reply cannot be found in the trace file.
Phys.User ID	The physical user ID (Unique ID) which is displayed as a binary value in the Broker trace, nicely formatted. In case of a C stub trace file, the real physical user ID is not available; instead of this the thread ID is used to construct a replacement for the physical user ID.
User ID	The user ID of the Broker call.

Column	Explanation												
Token	The token of the Broker call.												
User	An artificial identifier for a user session (using physical user ID, user ID, and token). This is a unique number prefixed with either <i>C</i> - or <i>S</i> - . The latter will be used if the caller can be identified (using the available data in the trace) as a server application.												
Function	The Broker function. If an option is specified it is appended to the function name. If a wait timeout is specified for the send or receive function it is appended.												
Error	Error class, error number and error text. Error 0000 0000 is not displayed. The text "Successful response" is not displayed.												
Service	The service address in the form class/server/service.												
Convid	The conversation ID prefixed with *. If the conversation ID in the reply is different from the one in the request, the one from the reply is used.												
Uowid	The unit of work ID prefixed with *. If the unit of work ID in the reply is different from the one in the request, the one from the reply is used.												
Uowstatus	The unit of work status												
Slen	The send length, i.e. the length of the data sent to the Broker.												
Retl	The return length, i.e. the length of the data returned from the application.												
Cuid	The client user ID (only for servers).												
Time1	The time of the request entry in the trace file.												
Time2	The time of the reply entry in the trace file.												
Api	The API version.												
Rlen	The (maximum) receive length specified in the send/receive call.												
Cstat	The conversation status (only for servers).												
Charset	The character used by the caller. Typical values are <i>ascii</i> , <i>ebcdic siemens</i> . If a value for the locale string has been specified, it is added using / as a separator.												
SecurityToken	<p>An interpretation of the security token of the request part. If the reply also contains a security token it is added using / as a separator. The interpretation of the prefixes is as follows:</p> <table border="1"> <tbody> <tr> <td>unknown</td> <td>The security token cannot be identified as a security token valid for EntireX Security</td> </tr> <tr> <td>enc</td> <td>The send/receive data is encrypted.<sup>(1)</sup></td> </tr> <tr> <td>pwd</td> <td>A password is specified in the call</td> </tr> <tr> <td>newpwd</td> <td>A new password is specified in the call.</td> </tr> <tr> <td>stub</td> <td>The security token has been built by an EntireX stub.</td> </tr> <tr> <td>server</td> <td>The security token has been processed by the Broker, the part which distinguishes security tokens is added.</td> </tr> </tbody> </table>	unknown	The security token cannot be identified as a security token valid for EntireX Security	enc	The send/receive data is encrypted. <sup>(1)</sup>	pwd	A password is specified in the call	newpwd	A new password is specified in the call.	stub	The security token has been built by an EntireX stub.	server	The security token has been processed by the Broker, the part which distinguishes security tokens is added.
unknown	The security token cannot be identified as a security token valid for EntireX Security												
enc	The send/receive data is encrypted. <sup>(1)</sup>												
pwd	A password is specified in the call												
newpwd	A new password is specified in the call.												
stub	The security token has been built by an EntireX stub.												
server	The security token has been processed by the Broker, the part which distinguishes security tokens is added.												
Security	Some security-relevant control block fields of the call. If Forcelogon is enabled, "fl:" is displayed. If send/receive data is encrypted (SecurityToken, see above, is "enc") either "broker" or "target" is displayed. If a password has been specified an artificial password is displayed. If in addition a new password has been specified, it is added												

Column	Explanation
	using / as a separator. The artificial password is displayed as "pwd" followed by a number (starting with 0).
TimeDiff	The elapsed time between the request and the reply (Time2 - Time1).
ReplyTime	Server response time (difference in time between the server receiving a request and sending the reply).
Seqid	The internal sequence ID of the Broker call. Only available for Broker version 7.3 or higher.
AppName	Name of the application communicating with the Broker. Only available if API version 9 or greater is used.
Node	Node name of the application which is communicating with the Broker, e.g. the TCP/IP hostname. Only available if API version 9 or greater is used.
Stub	Stub name and version used by the application communicating with the Broker. Only available if API version 9 or greater is used.
Library	Library name if Broker call is an RPC call. Only available for RPC clients, or for server version 8.0 or higher.
Program	Program name if Broker call is an RPC call. Only available for RPC clients, or for server version 8.0 or higher.
Brokerid	The Broker ID of the Broker call.
AppMon	Application Monitoring settings of the Broker call (for request and reply).
Date	The date of the request or reply entry in the trace file.
MessageIDRequest	The message ID of the request.
CorrelationIDRequest	The correlation ID of the request.
MessageIDReply	The message ID of the reply.
CorrelationIDReply	The correlation ID of the reply.

**Notes:**

1. Encryption is deprecated. For encrypted transport we strongly recommend using the Secure Sockets Layer/Transport Layer Security protocol. See *SSL/TLS and Certificates with EntireX*.

**Error Messages**

The utility will only produce a meaningful result if the trace file is not corrupt. When transferring a trace from a mainframe, make sure all columns of the trace file are transferred, otherwise the utility might report errors (e.g. 2, 4 or 9). It is also possible that no errors are reported but the resulting CSV file has columns which contain invalid data.

Number	Message	Explanation
1	{0}	Text of a Java exception thrown at runtime.
2	Trace has incomplete entry for Binpart, expected length = {0}, actual length = {1}	Will be displayed a maximum of 5 times. Output for Security Token, Password, and New Password may be corrupted. Typical reason: columns in the trace file were lost when copying the trace from the mainframe.
3	Physical user ID {0} has wrong length	Trace file is corrupt.
4	Trace has incomplete entry for Key or Reply string	Will be displayed a maximum of 5 times. Output for any value may be corrupted. Typical reason: columns in the trace file were lost when copying the trace from the mainframe.
5	More then one request per user: {0}	This is an error condition similar to the Broker error 0037 0197.
6	does not include prefix	Trace file is corrupt.
7	does not include unique ID	Trace file is corrupt.
8	does not include reply or key	Trace file is corrupt.
9	Trace output might be incomplete and/or erroneous	Output for any value may be corrupt.
10	Problem with file {0}	Problem with trace or output file.
11	Not enough memory to process trace, try increasing -Xmx or split trace	The Java runtime does not have enough memory to process the trace file. Increase the memory or delete unnecessary sections in the trace file.
12	SeqID "{0}" does not match "{1}"	The sequence ID of the request and the reply do not match. This may happen if the trace file is incomplete or corrupted. Otherwise contact Software AG support and provide the trace file.
13	Found: {0}	The text of a Broker error message found in the trace file is displayed. All non-zero return codes and the result of KERNELVERSION calls are displayed. This can be configured using a tool parameter.

## Show Trace

Show Trace enables you to display the values of a CSV file in a table (CSV=comma-separated values).

The first row of the file is used as the headers for the file.

## Sorting the Information

The information in the tables can be sorted by descending or ascending order. The sorting is done alphabetically, not numerically.

### > To sort the information in a column by ascending order

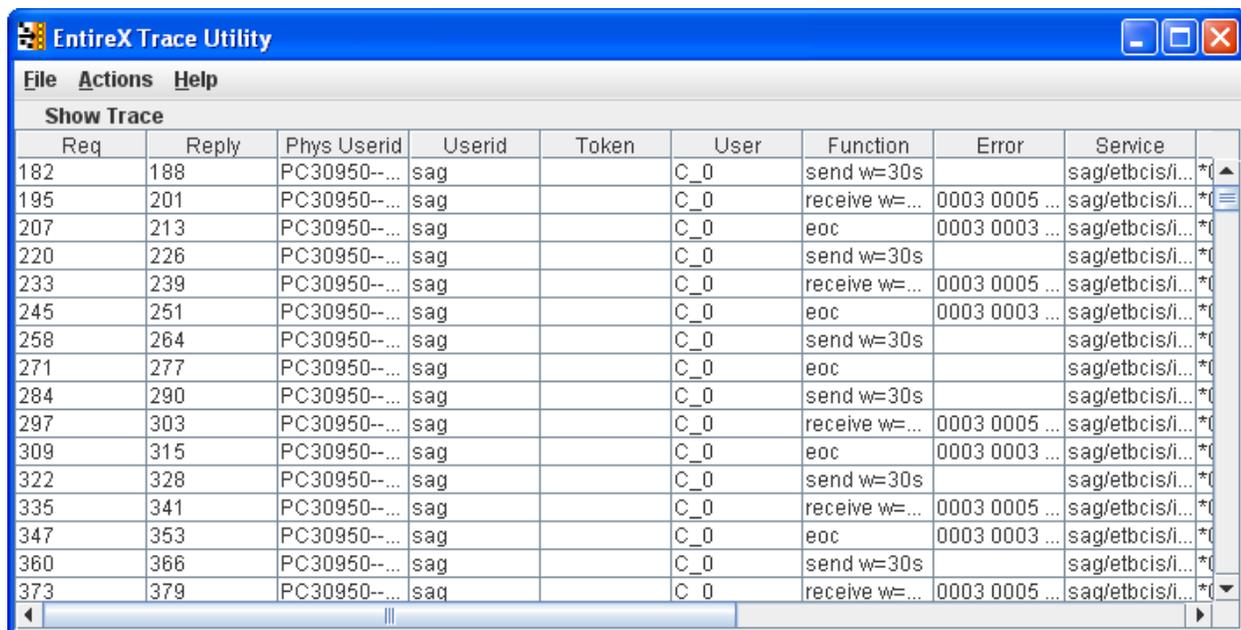

- Click on the header of the column.

### > To sort the information in a column by descending order

- Use SHIFT and click on the header of the column.

## Loading and Saving a CSV File

You can load and save a CSV file using the options located in the File menu.

The screenshot shows the 'EntireX Trace Utility' window with a menu bar (File, Actions, Help) and a 'Show Trace' button. Below is a table with 10 columns: Req, Reply, Phys Userid, Userid, Token, User, Function, Error, Service, and a final column with a dropdown arrow. The table contains 16 rows of data, all with 'sag' as the Userid and 'C\_0' as the User. The Function column alternates between 'send w=30s' and 'receive w=...'.

Req	Reply	Phys Userid	Userid	Token	User	Function	Error	Service	
182	188	PC30950--...	sag		C_0	send w=30s		sag/etbcis/i...	*()

## Using the EntireX Trace Utility in Batch Mode

The EntireX Trace Utility is a graphical tool to process and display trace information. It can also be used as a command-line tool to process trace information.

### ➤ To use the EntireX Trace Utility in batch mode

- Enter the following command in the command line:

```
java -jar exxutil.jar [-option] filename [
output file
]
```

or

```
java -Xms64m -Xmx256m -jar exxutil.jar [-option] filename [
output file
]
```

This specifies an initial and maximum memory allocation pool for the Java runtime (the defaults are 2 MB and 64 MB).

The *exxutil.jar* file is located in the classes subdirectory of the EntireX installation. *filename* is the name of the trace file. The output will be written to the file specified with the parameter *output file* or, if no name is specified there, output will be written to the file *filename.csv*.

### Options

Option	Description						
-version	to display the version information						
-short	to generate an overview						
-long	to generate the full output						
-sep <i>char</i>	the separator character used in the resulting CSV file, default is ","						
-type <i>type</i>	By default the EntireX Trace Utility tries to infer the type of the trace file from the contents. If this is not possible (output shows "Processed 0 Broker calls") the type can be explicitly specified as follows: <table border="1" data-bbox="446 1732 1479 1866"> <tbody> <tr> <td>java</td> <td>The trace has been written by the EntireX Java runtime.</td> </tr> <tr> <td>cstub</td> <td>The trace has been written by the C-based Broker stub.</td> </tr> <tr> <td>broker</td> <td>The trace has been written by the Broker kernel.</td> </tr> </tbody> </table>	java	The trace has been written by the EntireX Java runtime.	cstub	The trace has been written by the C-based Broker stub.	broker	The trace has been written by the Broker kernel.
java	The trace has been written by the EntireX Java runtime.						
cstub	The trace has been written by the C-based Broker stub.						
broker	The trace has been written by the Broker kernel.						

Option	Description
	directrpc The trace has been written by the Direct RPC component of webMethods EntireX Adapter for Integration Server.
-noshow <i>param</i>	The utility displays all Broker errors found in the trace. To prevent this either all errors or a set of specified errors can be excluded from the display. To prevent the display of all errors specify "all" as parameter. To prevent the display of specific errors specify the 8 digit error class and number. Multiple errors can be specified separated by ":". Examples: -noshow 00020002:00070007 or -noshow "0074 0074".

For the default and long display, filters can be specified:

Option	Description
-user < <i>user</i> >	to get entries for a particular user
-conversation < <i>convid</i> >	for a particular conversation ID
-service	for a particular service
-date	for a particular date

If more than one filter is specified, only those entries which satisfy all conditions will be displayed.

### Example

```
java -jar exxutil.jar -long -sep ";" trace.txt
```

will generate all columns in a file trace.txt using ";" as separator character, the result will be in the file trace.txt.csv.

## Usage Tips

### Invalid or Incomplete Data in the Resulting CSV File

The utility will only produce a meaningful result if the trace file is not corrupt. When transferring a trace from a mainframe, make sure that all columns of the trace file are transferred. Otherwise the utility might report errors, e.g. error 2, 4 or 9. It may also happen that no errors are reported but the resulting CSV file has columns which contain invalid data.

## Open the CSV File in Microsoft Excel

The CSV file can usually be opened in Microsoft Excel by double-clicking on the file name in the Windows Explorer. If the data is not displayed correctly, the separator character used by the utility (default is ";") does not match the list separator character used by Windows. Use the `-sep` option to specify a different separator character. To check the list separator used by Windows, go to **Control Panel > Regional Options > Numbers**.

Alternatively you may use the import functionality of Microsoft Excel. Open a spreadsheet, use **Data > Get External Data > Import Text File**. After selecting the file name (change default file type \*.txt) the Text Import Wizard starts, which allows you to specify the delimiter (separator) character.

## Displaying and Analyzing the CSV File in Microsoft Excel

The following are some tips how to use Microsoft Excel as a tool for displaying and analyzing the CSV file. They refer to Microsoft Excel 2000.

Formatting the spreadsheet: use CTRL A to select all data, change the font size e.g. to 8, then use **Format > Column > AutoFit Selection** to format all columns. Make the first line a "header line": select the 2nd line, use **Window > Freeze Panes**. Now, when scrolling through the entries the header line always stays on top.

Enable filtering: select the 1st line, use **Data > Filter > AutoFilter**. Now you have a drop-down box on each header entry that allows you to select a subset of the Broker calls.

## Sorting Order

You can sort the entries in the generated CSV file using the Reply column. Thus the ordering corresponds to the time when the Broker kernel sends back the reply for the Broker call. Calls where no reply can be found in the trace appear at the end. If you use the Request column as the sorting criteria, the Broker calls will be ordered corresponding to the time when the Broker call arrives at the Broker kernel.

# 18 Broker Shutdown Statistics

---

- Shutdown Statistics Output ..... 216
- Table of Shutdown Statistics ..... 216

## Shutdown Statistics Output

After a successful Broker execution, shutdown statistics and related information are produced. This output is written in the following sequence:

1. The diagnostic message ETBD0444 is written into the Broker trace log.
2. The output - i.e. statistics, internals and user-specified parameters - is written into the end of the Broker trace log file at shutdown.

## Table of Shutdown Statistics

See [Legend](#) below for explanation of output type.

Output Type	Display Field	Description
U	Broker ID	Identifies the Broker kernel to which the attribute file applies. See BROKER-ID.
I	Version	The version of the Broker kernel currently running.
I	Generated platform family	The platform family for which this Broker kernel was built.
I	Runtime platform	The platform on which this Broker kernel is currently running.
I	Start time	The date and time when this Broker kernel started.
S	Restart count	The restart count indicates how many times the Broker kernel has been started with the persistent store. Therefore, after a cold start (PSTORE=COLD), the restart count will be 1. Then, after subsequent hot starts (PSTORE=HOT), the restart count will be 2 or greater.
U	Trace level	The value for the trace setting for this Broker kernel. See TRACE-LEVEL.
U	Worker tasks	The number of worker tasks for this Broker kernel. See NUM-WORKER.
U	MAX-MEMORY	The value of MAX-MEMORY or 0 if not defined. See MAX-MEMORY.
S	Memory allocated	Size of the allocated memory, in bytes.
S	Memory allocated HWM	Highest size of allocated memory in bytes since Broker started.
U	NUM-SERVICE	Value of NUM-SERVICE or 0 if not defined. See NUM-SERVICE.
S	Services active	The number of services currently active for this Broker kernel.
U	NUM-CLIENT	Value of NUM-CLIENT or 0 if not defined. See NUM-CLIENT.
S	Clients active	The number of clients currently active for this Broker kernel.
S	Clients active HWM	The high watermark for the number of clients active for this Broker kernel.

Output Type	Display Field	Description
U	NUM-SERVER	Value of NUM-SERVER or 0 if not defined. See NUM-SERVER.
S	Servers active	The number of servers currently active for this Broker kernel.
S	Servers active HWM	The high watermark for the number of servers active for this Broker kernel.
U	NUM-CONVERSATION	Value of NUM-CONVERSATION or 0 if not defined. See NUM-CONVERSATION.
S	Conversations active	The number of conversations currently active for this Broker kernel.
S	Conversations active HWM	The high watermark for the number of conversations active for this Broker kernel.
U	NUM-LONG-BUFFER	Value of NUM-LONG-BUFFER or 0 if not defined. See NUM-LONG-BUFFER.
S	Long buffers active	The number of long message buffers currently in use for this Broker kernel.
S	Long buffers active HWM	The high watermark for the number of long message buffers used for this Broker kernel.
U	NUM-SHORT-BUFFER	Value of NUM-SHORT-BUFFER or 0 if not defined. See NUM-SHORT-BUFFER.
S	Short buffers active	The number of short message buffers currently in use for this Broker kernel.
S	Short buffers active HWM	The high watermark for the number of short message buffers used for this Broker kernel.
U	Persistent store type	The type of persistent store used by this Broker kernel. See PSTORE-TYPE.
U	UOW persistence	Indicates whether units of work are persistent or not in this Broker kernel. See STORE.
U	Persistent store startup	Indicates the status of the persistent store at Broker startup. See PSTORE.
U	Persistent status lifetime	The multiplier to compute the lifetime of the persistent status. See UWSTATP.
U	Deferred UOWs allowed	Indicates whether or not deferred units of work are allowed. See DEFERRED.
U	Maximum allowed UOWs	The maximum number of units of work that can be active concurrently for this Broker kernel. See MAX-UOWS.
U	Maximum messages per UOW	The maximum number of messages allowed in a unit of work. See MAX-MESSAGES-IN-UOW.
U	UOW lifetime in seconds	Indicates the default lifetime for a unit of work. See UOW-DATA-LIFETIME.
U	Maximum message length	Indicates the maximum message size that can be sent. See MAX-UOW-MESSAGE-LENGTH.

Output Type	Display Field	Description
U	New UOW messages allowed	Indicates whether or not new units of work are allowed in this Broker kernel. See NEW-UOW-MESSAGES.
S	UOWs active	The number of units of work currently active in this Broker kernel.
S	Current UOW	The number of the last unit of work in this Broker kernel.
U	Accounting	Indicates the status of accounting records in this Broker kernel. See ACCOUNTING.
U	SSL port *	If applicable, the SSL port number on which this Broker kernel will listen for connection requests. See SSL-specific attribute PORT.
U	TCP port *	If applicable, the TCP port number on which this Broker kernel will listen for connection requests. See TCP-specific attribute PORT.
I	Number of function calls	Marks the beginning of the section of summary statistics for all the function calls.
S	DEREGISTER	The number of Broker DEREGISTER function calls since startup.
S	EOC	The number of Broker EOC function calls since startup.
S	KERNELVERS	The number of Broker KERNELVERS function calls since startup.
S	LOGOFF	The number of Broker LOGOFF function calls since startup.
S	LOGON	The number of Broker LOGON function calls since startup.
S	RECEIVE	The number of Broker RECEIVE function calls since startup.
S	REGISTER	The number of Broker REGISTER function calls since startup.
S	SEND	The number of Broker SEND function calls since startup.
S	SYNCPOINT	The number of Broker SYNCPOINT function calls since startup.
S	UNDO	The number of Broker UNDO function calls since startup.
S	REPLY_ERROR	The number of Broker REPLY_ERROR function calls since startup.
I	Worker task statistics	Marks the beginning of the section of summary statistics for all the worker tasks.
I	Worker number	The identifier of the worker task.
I	Status	The status of the worker task at shutdown.
S	# of calls	The number of Broker calls handled by the worker task since startup.
S	Idle time in seconds	The number of seconds the worker task has been idle since startup.

\* Does not apply to z/OS.

**Legend**

<b>Output Type</b>	<b>Description</b>	<b>Value</b>	<b>Origin of Value</b>
I	Internal Information	Static	Determined by Software AG EntireX.
S	Shutdown Statistic	Variable	Determined by Broker activity during execution.
U	User-Specified Parameter	Variable	Specified by Broker administrator before or, if allowable, during execution.

# 19 Command Logging in EntireX

---

- Introduction to Command Logging ..... 222
- Command Log Filtering using Command-line Interface etbcmd ..... 224
- ACI-driven Command Logging ..... 225
- Dual Command Log Files ..... 225

Command logging is a feature to assist in debugging Broker ACI applications. A command in this context represents one user request sent to the Broker and the related response of Broker.

Command logging is a feature that writes the user requests and responses to file in a way it is already known with Broker trace and `TRACE-LEVEL=1`. But command logging works completely independent from trace, and data is written to a file only if defined command trace filters detect a match.

Broker stub applications send commands or requests to the Broker kernel, and the Broker kernel returns a response to the requesting application. Developers who need to resolve problems in an application need access to those request and response strings inside the Broker kernel. That's where command logging comes in. With command logging, request and response strings from or to an application are written to a file that is separate from the Broker trace file.

## Introduction to Command Logging

---

This section provides an introduction to command logging in EntireX and offers examples of how command logging is implemented. It covers the following topics:

- [Overview](#)
- [Command Log Files](#)
- [Defining Filters](#)
- [Programmatically Turning on Command Logging](#)

### Overview

Command logging is similar to a Broker trace that is generated when the Broker attribute `TRACE-LEVEL` is set to 1. Broker trace and command logging are independent of each other, and therefore the configuration of command logging is separate from Broker tracing.

The following Broker attributes are involved in command logging:

Attribute	Description
<code>CMDLOG</code>	Set this to "N" if command logging is not needed.
<code>CMDLOG-FILE-SIZE</code>	A numeric value indicating the maximum size of command log file in KB.
<code>NUM-CMDLOG-FILTER</code>	The maximum number of filters that can be set.

In addition to `CMDLOG=YES`, the Broker needs the assignment of the dual command logging files during startup. If these assignments are missing, Broker will set `CMDLOG=NO`. See also *Broker Attributes*.

## Command Log Files

The Broker keeps a record of commands (request and response strings) in a command log file.

At Broker startup, you will need to supply two command log file names and paths. Only one file is open at a time, however, and the Broker writes commands (requests and responses) to this file.

Under UNIX and Windows, the startup options `-y` and `-z` are evaluated by executable `etbnuc`. These options are used to specify the command log file names. Startup script/service assign these files by default.

When the size of the active command log file reaches the KB limit set by `CMDLOG-FILE-SIZE`, the file is closed and the second file is opened and becomes active. When the second file also reaches the KB limit set by `CMDLOG-FILE-SIZE`, the first file is opened and second file is closed. Existing log data in a newly opened file will be lost.

## Defining Filters

In command logging, a filter is used to store and identify a class, server, or service, as well as a user ID.

Use the command-line tool `etbcmd` to define a filter. During processing, the Broker evaluates the class, server, service, and user ID associated with each incoming request and compares them with the same parameters specified in the filters. If there is a match, the request string and response string of the request is printed out to the command log file.

## Programmatically Turning on Command Logging

Applications using ACI version 9 or above have access to the new field `LOG-COMMAND` in the ACI control block.

If this field is set, the accompanying request and the Broker's response to this request is logged to the command log file.

**Note:** Programmatic command logging ignores any filters set in the kernel.

## Command Log Filtering using Command-line Interface etbcmd

The examples assume that Broker has been started with the attribute `CMDLOG=Y`.

- [Setting Filters](#)
- [Deleting Filters](#)
- [Disabling and Enabling a Filter](#)

### Setting Filters

Filters need to be set before running the stub applications whose commands are to be logged.

Command	Description
<pre>etbcmd -blocalhost:1970:TCP -cSET-CMDLOG-FILTER -dBROKER -xuser -nAClass/ASERVER/ASERVICE</pre>	<p>This command sets filters on <code>AClass/ASERVER/ASERVICE</code>. All ACI calls issued by <i>all</i> users to this service will be logged.</p>
<pre>etbcmd -blocalhost:1970:TCP -cSET-CMDLOG-FILTER -dBROKER -xuser -nAClass/ASERVER/ASERVICE -Usaguser1</pre>	<p>This command set filters on <code>AClass/ASERVER/ASERVICE</code> and user ID <code>saguser1</code>. All ACI calls to this service <i>as well as</i> those issued by <code>saguser1</code> will be logged.</p>

**Note:** If more than one service is set as a filter, all ACI calls sent to any of these services will be logged. Identical filters cannot be set. Attempts to set a second filter that matches an existing filter will be rejected. Similarly, the maximum number of filters that can be added is defined in `NUM-CMDLOG-FILTER`. If the maximum number of filters is already being used, delete an existing filter to make room for a new filter.

### Deleting Filters

The following provides an example of how to delete an existing filter on a service.

#### > To delete a filter

- Enter the following command.

If the filter does not exist, the command will return an error.

## Disabling and Enabling a Filter

Filters can be set and still be disabled (made inactive).

### > To disable a filter

- Enter the following command.

**Note:** A disabled filter will not bring down the count of filters in use.

### > To enable a filter

- Enter the following command to enable the disabled filter.

## ACI-driven Command Logging

---

EntireX components that communicate with Broker can trigger command logging by setting the field `LOG-COMMAND` in the ACI control block.

When handling ACI functions with command log turned on, Broker will not evaluate any filters. Application developers must remember to reset the `LOG-COMMAND` field if subsequent requests are not required to be logged.

## Dual Command Log Files

---

Broker's use of two command log files prevents any one command log file from becoming too large.

When starting a Broker with command log support, you must therefore specify two file names and paths - one for each of the two command log files. The sample startup script installed with the product uses the variables `ETB_CMDLOG1` and `ETB_CMDLOG2` as the default command log file names.

Under Windows, the keys `ETB_CMDLOG1` and `ETB_CMDLOG2` are entered in the Registry with values `CMDLOGR1` and `CMDLOGR2`.

At startup, Broker initializes both files and keeps one of them open. Command log statements are printed to the open file until the size of this file reaches the value specified in the Broker attribute `CMDLOG-FILE-SIZE`. This value must be specified in KB.

When the size of the open file exceeds the value specified in the Broker attribute `CMDLOG-FILE-SIZE`, Broker closes this file and opens the other, dormant file. Because the Broker closes a log file only when unable to print out a complete log line, the size of a *full* file may be smaller than `CMDLOG-FILE-SIZE`.

# 20 Accounting in EntireX Broker

---

- EntireX Accounting Data Fields ..... 228
- Using Accounting under UNIX and Windows ..... 231
- Example Uses of Accounting Data ..... 232

This chapter describes the accounting records for Broker that can be used for several purposes, including:

- **application chargeback**  
for apportioning EntireX resource consumption on the conversation and/or the application level;
- **performance measurement**  
for analyzing application throughput (bytes, messages, etc.) to determine overall performance;
- **trend analysis**  
for using data to determine periods of heavy and/or light resource and/or application usage.

## EntireX Accounting Data Fields

In the EntireX Accounting record, there are various types of data available for consumption by applications that process the accounting data:

Field Name	Accounting Version	Type of Field	Description
Record Write Time	1	A14 timestamp	The time this record was written to the accounting file in "YYYYMMDDHHMMSS" format.
EntireX Broker ID	1	A32	Broker ID from attribute file.
EntireX Version	1	A8	Version information, <i>v . r . s . p</i>  where <i>v</i> =version <i>r</i> =release <i>s</i> =service pack <i>p</i> =patch level  for example 10.1.0.00.
Platform of Operation	1	A32	Platform where EntireX is running.
EntireX Start Time	1	A14 timestamp	The time EntireX was initialized in "YYYYMMDDHHMMSS" format.
Accounting Record Type	1	A1	It is always C for conversation. Future Types will have a different value in this field.
Client User ID	1	A32	USER-ID ACI field from the client in the conversation.
Client Token	1	A32	TOKEN field from the ACI from the client.
Client Physical ID	1	A56	The physical user ID of the client, set by EntireX.
Client Communication Type	1	I1	Communication used by client:  1 = Net-Work

Field Name	Accounting Version	Type of Field	Description
			2 = TCP/IP 3 = APPC 4 = IBM® MQ 5 = SSL
Client Requests Made	1	I4	Number of Requests made by client.
Client Sent Bytes	1	I4	Number of bytes sent by client.
Client Received Bytes	1	I4	Number of bytes received by client.
Client Sent Messages	1	I4	Number of messages sent by client.
Client Received Messages	1	I4	Number of messages received by client.
Client Sent UOWs	1	I4	Number of UOWs sent by client.
Client UOWs Received	1	I4	Number of UOWs received by client.
Client Completion Code	1	I4	Completion code client received when conversation ended.
Server User ID	1	A32	USER - ID ACI field from the server in the conversation.
Server Token	1	A32	TOKEN field from the ACI from the server.
Server Physical ID	1	A56	The physical user ID of the server, set by EntireX.
Server Communication Type	1	I1	Communication used by Server:  1 = Entire Net-Work 2 = TCP/IP 3 = APPC 4 = IBM® MQ 5 = SSL
Server Requests Made	1	I4	Number of requests made by server.
Server Sent Bytes	1	I4	Number of bytes sent by server.
Server Received Bytes	1	I4	Number of bytes received by server.
Server Sent Messages	1	I4	Number of messages sent by server.
Server Received Messages	1	I4	Number of messages received by server.
Server Sent UOWs	1	I4	Number of UOWs sent by server.
Server Received UOWs	1	I4	Number of UOWs received by server.
Server Completion Code	1	I4	Completion code server received when conversation ended.
Conversation ID	1	A16	CONV - ID from ACI.
Server Class	1	A32	SERVER - CLASS from ACI.
Server Name	1	A32	SERVER - NAME from ACI.
Service Name	1	A32	SERVICE from ACI.
CID=NONE Indicator	1	A1	Will be N if CONV - ID=NONE is indicated in application.

Field Name	Accounting Version	Type of Field	Description
Restarted Indicator	1	A1	Will be R if a conversation was restarted after a Broker shutdown.
Conversation Start Time	1	A14 timestamp	The time the conversation began in "YYYYMMDDHHMMSS" format.
Conversation End Time	1	A14 timestamp	The time the conversation was cleaned up in "YYYYMMDDHHMMSS" format.
Conversation CPU Time	1	I4	Number of microseconds of CPU time used by the conversation
Client Security Identity	2	A32	Actual identity of client derived from authenticated user ID.
Client Application Node	2	A32	Node name of machine where client application executes.
Client Application Type	2	A8	Stub type used by client application.
Client Application Name	2	A64	Name of the executable that called the broker. Corresponds to the Broker Information Service field APPLICATION-NAME.
Client Credentials Type	2	I1	Mechanism by which authentication is performed for client.
Server Security Identity	2	A32	Actual identity of server derived from authenticated user ID.
Server Application Node	2	A32	Node name of machine where server application executes.
Server Application Type	2	A8	Stub type used by server application.
Server Application Name	2	A64	Name of the executable that called the broker. Corresponds to the Broker Information Service field APPLICATION-NAME.
Server Credentials Type	2	I1	Mechanism by which authentication is performed for server.
Client RPC Library	3	A128	RPC library referenced by client when sending the only/first request message of the conversation.
Client RPC Program	3	A128	RPC Program referenced by client when sending the only/first request message of the conversation.
Server RPC Library	3	A128	RPC library referenced by server when sending the only/first response message of the conversation.
Server RPC Program	3	A128	RPC Program referenced by server when sending the only/first response message of the conversation.
Client IPv4 Address	4	A16	IPv4 address of the client.
Server IPv4 Address	4	A16	IPv4 address of the server.

Field Name	Accounting Version	Type of Field	Description
Client Application Version	4	A16	Application version of the client.
Server Application Version	4	A16	Application version of the server.
Client IPv6 Address	5	A46	IPv6 address of the client.
Server IPv6 Address	5	A46	IPv6 address of the server.

 **Note:** Accounting fields of any version greater than 1 are created only if the attribute `ACCOUNTING-VERSION` value is greater than or equal to the corresponding version. For example: accounting fields of version 2 are visible only if `ACCOUNTING-VERSION=2` or higher is specified.

## Using Accounting under UNIX and Windows

- [Broker Attribute File Settings](#)
- [Retrieving Accounting Data](#)

### Broker Attribute File Settings

`ACCOUNTING = NO | YES | (YES, SEPARATOR=Separator Characters)` (Default is NO)

Set this parameter to "NO" (i.e., do not create accounting data) or "YES" to create accounting data. Up to seven separator characters can be specified using the `SEPARATOR` suboption, for example `ACCOUNTING = (YES, SEPARATOR=;)`. If no separator character is specified, the comma character will be used.

### Retrieving Accounting Data

The accounting file will be located in the Broker's installed directory. The file's name is based on the `ETB_LOG` environment variable and the current date and time (for uniqueness). Example: If `ETB_LOG` is set to `BROKER1.LOG`, the accounting data file will be named `BROKER1_YYYYMMDDH-HMMSS.csv`. If `ETB_LOG` is not set, the Broker's ID will be used, with an extension of `CSV` (e.g. `ETB048_YYYYMMDDHHMMSS.csv`). See *Environment Variables in EntireX*.

## Example Uses of Accounting Data

---

- Chargeback
- Trend Analysis
- Tuning for Application Performance

### Chargeback

Customers can use the EntireX accounting data to perform chargeback calculations for resource utilization in a data center. Suppose EntireX Broker is being used to dispatch messages for three business departments: Accounts Receivable, Accounts Payable, and Inventory. At the end of each month, the customer needs to determine how much of the operation and maintenance cost of EntireX Broker should be assigned to these departments. For a typical month, assume the following is true:

Department	Amount of Data	Percentage	Messages Sent	Percentage	Average Percentage
Accts Payable	50 MB	25	4000	20	22.5
Accts Receivable	40 MB	20	6000	30	25
Inventory	110 MB	55	10000	50	52.5

The use of Broker resources here is based upon both the amount of traffic sent to the Broker (bytes) as well as how often the Broker is called (messages). The average of the two percentages is used to internally bill the departments, so 52.5% of the cost of running EntireX Broker would be paid by the Inventory Department, 25% by the Accounts Receivable Department, and 22.5% by the Accounts Payable Department.

### Trend Analysis

The Accounting Data can also be used for trend analysis. Suppose a customer has several point-of-sale systems in several stores throughout the United States that are tied into the corporate inventory database with EntireX. The stubs would be running at the stores, and the sales data would be transmitted to the Broker, which would hand it off to the appropriate departments in inventory. If these departments wish to ascertain when the stores are busiest, they can use the accounting data to monitor store transactions. Assume all of the stores are open every day from 9 AM to 10 PM.

Local Time	Average: Weekday Transactions per Store	Maximum Weekday Transactions in any Store	Average Weekend Transactions per Store	Maximum Weekend Transactions in any Store
9 AM	7.3	27	28.2	83
10 AM	11.2	31	29.3	102
11 AM	14.6	48	37.9	113
12 noon	56.2	106	34.8	98
1 PM	25.6	65	34.2	95
2 PM	17.2	52	38.5	102
3 PM	12.1	23	42.7	99
4 PM	18.3	34	43.2	88
5 PM	26.2	47	45.2	93
6 PM	38.2	87	40.6	105
7 PM	29.6	83	39.2	110
8 PM	18.6	78	28.6	85
9 PM	11.2	55	17.5	62

The owner of the stores can examine the data and make decisions based upon the data here. For example, on weekdays, he or she can see that there is little business until lunchtime, when the number of transactions increase. It then decreases during lunch hour; then there is another increase from 5 PM to 8 PM, after people leave work. Based on this data, the owner might investigate changing the store hours on weekdays to 10 AM to 9 PM. On the weekend the trends are different, and the store hours could be adjusted as well, although there is a more regular customer flow each hour on the weekends.

### Tuning for Application Performance

Assume that a customer has two applications that perform basic request/response messaging for similar sized messages. The applications consist of many Windows PC clients and Natural RPC Servers on UNIX. An analysis of the accounting data shows the following:

Application Type	Class	Server	Service	Average Server Messages Received per Conversation	Average Client Messages Received per Conversation
Application 1:	CLASS1	SERVER1	SERVICE1	10.30	10.29
Application 2:	CLASS2	SERVER2	SERVICE2	10.30	8.98

A further analysis of the accounting data reveals that there are a lot of non-zero response codes in the records pertaining to Application 2, and that a lot of these non-zero responses indicate timeouts. With that information, the customer can address the problem by modifying the server code, or by adjusting the timeout parameters for SERVER2 so that it can have more time to get a response from the Service.
