Document Conventions

Convention	Description
Bold	Identifies elements on a screen.
Monospace font	Identifies service names and locations in the format <i>folder.subfolder.service</i> , APIs, Java classes, methods, properties.
<i>Italic</i>	Identifies: Variables for which you must supply values specific to your own situation or environment. New terms the first time they occur in the text. References to other documentation sources.
Monospace font	Identifies: Text you must type in. Messages displayed by the system. Program code.
{ }	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the symbol.
[]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [] symbols.
...	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...).

Online Information and Support

Software AG Documentation Website

You can find documentation on the Software AG Documentation website at <http://documentation.softwareag.com>. The site requires credentials for Software AG's Product Support site Empower. If you do not have Empower credentials, you must use the TECHcommunity website.

Software AG Empower Product Support Website

If you do not yet have an account for Empower, send an email to empower@softwareag.com with your name, company, and company email address and request an account.

Once you have an account, you can open Support Incidents online via the eService section of Empower at <https://empower.softwareag.com/>.

You can find product information on the Software AG Empower Product Support website at <https://empower.softwareag.com>.

To submit feature/enhancement requests, get information about product availability, and download products, go to [Products](#).

To get information about fixes and to read early warnings, technical papers, and knowledge base articles, go to the [Knowledge Center](#).

If you have any questions, you can find a local or toll-free number for your country in our Global Support Contact Directory at https://empower.softwareag.com/public_directory.asp and give us a call.

Software AG TECHcommunity

You can find documentation and other technical information on the Software AG TECHcommunity website at <http://techcommunity.softwareag.com>. You can:

- Access product documentation, if you have TECHcommunity credentials. If you do not, you will need to register and specify "Documentation" as an area of interest.
- Access articles, code samples, demos, and tutorials.
- Use the online discussion forums, moderated by Software AG professionals, to ask questions, discuss best practices, and learn how other customers are using Software AG technology.
- Link to external websites that discuss open standards and web technology.

Data Protection

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

2 Post-installation Steps under UNIX

■ Shell Environment Settings	6
■ Broker Instance Created Automatically during Installation	7
■ Startup Daemon 'etbsrv'	7
■ Verifying the EntireX Installation	8
■ Setting up EntireX Security under UNIX	12
■ Mini Runtime Considerations	14
■ Natural Considerations	14

Under UNIX and Windows, EntireX is now installed using the Software AG Installer, which you download from the Software AG Empower website at [Empower](http://documentation.softwareag.com). You can view the documentation for the Software AG Installer under <http://documentation.softwareag.com> > *Software AG Installer and Update Manager*.

This chapter assumes you have already installed EntireX using the Software AG Installer. It covers installation instructions for components not included in the Software AG Installer; instruction on how to verify the installation and set up EntireX Security.

Shell Environment Settings

EntireX requires some shell environment variables to be set for proper operation. The installation provides two shell scripts *exxenv* and *exxenv.csh* in the *EntireX/INSTALL* directory. Source one of these scripts from within the *.profile* of the EntireX users.

Sourcing this script, which includes additional environment scripts, defines the following variables:

Variable	Description
EXXDIR	Identifies the base installation directory for EntireX (typically <i>/opt/softwareag/EntireX</i>)
EXXVERS	Identifies the product version. This variable is deprecated and is set to "." for reasons of backward compatibility.
ETBLNK	Identifies the absolute path to the broker stubs library if EntireX Broker has been installed: <i>\$EXXDIR/lib/broker.so</i> .
JAVA_HOME	Identifies the Java directory in the installation.

In addition, the script modifies the environment variables *PATH*, *LD_LIBRARY_PATH* (*LIBPATH* under AIX, and *SHLIB_PATH* under HP-UX).

- directory */<Install_Dir>/EntireX/bin* is added to the list of directories in the *PATH* environment variable
- the directory */<Install_Dir>/EntireX/lib* is added to *LD_LIBRARY_PATH* (*LIBPATH* under AIX, and *SHLIB_PATH* under HP-UX).

Broker Instance Created Automatically during Installation

If check box **Turn on Autostart for default EntireX Broker** is checked, the installation starts the default broker ETB001. This broker instance listens on the TCP/IP and SSL ports defined in the custom panel during installation. Default port numbers are 1971 (TCP/IP) and 1958 (SSL).

➤ To change the default port of the default broker

- 1 Stop the broker, using one of the following methods:

- Use System Management Hub. See *Stopping a Local Broker*.
- Source the EntireX environment file `<Installation_Dir>/EntireX/INSTALL/xxenv[.csh]` and enter command:

```
<Installation_Dir>/EntireX/bin/defaultbroker stop
```

- 2 Edit the configuration file `config/entirex.config` and change the TCP/IP and SSL port numbers to a different value. For other broker instances, see `PORT` under *Broker Attributes*.

- 3 Start the broker, using one of the following methods:

- Use System Management Hub. See *Starting a Local Broker*.
- Enter command:

```
<Installation_Dir>/EntireX/bin/defaultbroker start
```

Startup Daemon 'etbsrv'

This daemon runs in the background for the System Management Hub agents to administer broker instances. It is installed as `etbsrv` in the directory `<Installation_Dir>/bin`.

➤ To start the daemon

- Enter the following command:

```
- <Installation_Dir>/EntireX/bin/sagexx start
```

This ensures that `etbsrv` is always running and ready to receive start/stop commands from System Management Hub agents. Note that the startup script `sagexx` sources the SAG environment file `EntireX/INSTALL/xxenv`.

➤ To stop the daemon

- Enter the following command:

```
- <Installation_Dir>/EntireX/bin/sagexx stop
```

It is also registered to startup at boot time, therefore the installation generates additional scripts in a location that depends on the operating system:

Operating System	Location	Note
Solaris, Linux	/etc/init.d	Recent Linux versions use systemd instead of init scripts.
AIX	/etc	
HP-UX	/sbin/init.d	

See also *Administering EntireX Broker using System Management Hub*.

Verifying the EntireX Installation

- [EntireX Broker](#)
- [Developer's Kit](#)
- [Broker Stubs](#)
- [Environment Variables](#)

EntireX Broker

To verify successful installation, you can use the `etbcmd` utility in the directory `/<Install_Dir>/EntireX/bin`. It checks whether the Broker is up and running and responds to various requests as described below.

1. Start the Broker by executing shell script `etbstart` in the `/<Install_Dir>/EntireX/bin` directory:

```
etbstart ETBnn
```

2. Execute:

```
etbcmd -b<broker-id> -cPING -dBROKER
```

If successful, the message `PING broker broker-id successfully performed` is returned.

In a Natural environment, you can also verify correct installation under UNIX by installing the EntireX Broker Tutorial. See [Installing the Natural-based EntireX Broker Tutorial under UNIX](#).

Developer's Kit

➤ To verify the installation

- 1 Check that EntireX Broker is installed on the target node and is up and running.
- 2 Create and run a sample application (see below).

➤ To create and run a sample application

- Create and run a sample application provided in the directory `/<Install_Dir>/EntireX/examples/RPC/CServer`:

The following steps describe how to run the sample application locally:

1. Verify that the EntireX environment is adapted to your environment.
2. Verify that the EntireX Broker stub is installed in your EntireX environment.
3. Create an example RPC server with the following steps:
 - a. Change to directory `/<Install_Dir>/EntireX/examples/RPC/CServer`.

```
cd /<Install_Dir>/EntireX/examples/RPC/CServer
```

- b. Create the server library with the command `make`.
- c. Add this directory to the `LD_LIBRARY_PATH` (`LIBPATH` under AIX and `SHLIB_PATH` under HP-UX).
- d. Modify the configuration `server.cfg` file to set up the Broker address for your environment.
- e. Start the RPC server with

```
../../../../bin/rpcserver CFG=server.cfg
```

4. Create an example RPC client with the following steps:

- a. Change to directory `/<Install_Dir>/EntireX/examples/RPC/CClient`.

```
cd /<Install_Dir>/EntireX/examples/RPC/CClient
```

- b. Create the client with the command:

```
make
```

The client will be built in the current directory.

- c. Start the RPC client with

```
client <your_broker>@RPC/SRV1/CALLNAT
```

Set `<your_broker>` to the configured Broker of the server configuration.

Broker Stubs

» To verify broker stubs installation

- 1 Ensure that you have installed the EntireX Broker on the target node and that it is up and running.
- 2 Ensure that the variable `ETBLNK` is set to `/<Install_Dir>/EntireX/lib/broker.s[o|l]` and that the `ETB_TRANSPORT` variable is set correctly, by entering the command:

```
env | grep ET
```

- 3 Enter the commands to run the test programs. In the following example, both programs are run on the local node. The Broker ID is `ETB048` and the `REPEATS` value is 100 (see [convClt Parameters](#) below). The value `-2` indicates that the Broker is Version 2.1.1 or above.

```
cd /<Install_Dir>/EntireX/examples/ACI/conversational/C
convSvr -i100 -bETB048 -2&
convClt -i100 -bETB048 -2
```

If you have problems, check that environment variable `ETBLNK` refers to the Broker shared library in directory `/<Install_Dir>/EntireX/lib`. If not, rerun `SAGINST`. If you receive error 02150148, verify that the Broker is running on the target machine.

convClt Parameters

Parameter	Description	ACI Field
-a <i>locale</i>	<i>locale_string,environment</i>	LOCALE-STRING, ENVIRONMENT
-b <i>brokerid</i>	Broker ID (same as the database ID). This is an EntireX Broker configuration parameter. For example: convSrv -bETB045	BROKER-ID
-c <i>class</i>	Server class (part of the server definition).	SERVER-CLASS
-g <i>input_file_name</i>	Use a file as send buffer.	
-i <i>repeats</i>	The number of requests that are accepted by the example program before it deregisters. For example: convSrv -i10	
-l	Silent mode. Suppress output for every incoming request.	
-n <i>token</i>	Specify the security token, if desired.	TOKEN
-p <i>packet_size</i>	convClt only. The size, in bytes, of the packets that will be transmitted (i.e. size of the send buffer). For example: convClt -p10000	
-r <i>compression_level</i>	Compression level. Values: N Y 0-9.	COMPRESSLEVEL
-s <i>server</i>	Name of server.	SERVER-NAME
-u <i>userid</i>	User ID. With a secure broker, this will be used to perform authentication.	USER-ID
-v <i>service</i>	Name of service (part of the server definition). The fully qualified server name used by the example program to register. The default is ACLASS, ASERVER, ASERVICE. Values must be configured in the EntireX Broker.	SERVICE
-w <i>password</i>	Password. With a secure broker, this will be used to perform authentication.	PASSWORD
-x <i>sslparms</i>	SSL parameters. For example: -x"TRUST_STORE=C:\SoftwareAG\EntireX\ etc\ExxCACert.pem&VERIFY_SERVER=NO"	
-1..9	Specify the API version (note that certain features might depend on a specific minimum level).	API-VERSION

convSrv Parameters

Most `convClt` parameters apply to `convSrv`, too. The following table lists additional parameters or parameters that have a different meaning.

Parameter	Description	ACI Field
<code>-g output_file_name</code>	Name of output file for receive buffer (if not running in silent mode).	

Environment Variables

This section describes the environment variables required for Developer's Kit.

➤ To check the definitions of the environment variables

- Enter the command `printenv`.

If the definitions are not correct, set them as described.

Environment Variable		Description
EXXDIR		This is the top level directory. It is set during the installation procedure.
PATH		This points to the directories <code>/<Install_Dir>/EntireX/examples/bin</code> and <code>/<Install_Dir>/EntireX/bin</code> .
CLASSPATH		This points to the current directory and to <code>/<Install_Dir>/EntireX/classes/entirex.jar</code> , which contains the class libraries and package for EntireX Java ACI, Java Wrapper, XML/SOAP Wrapper and EntireX Broker Agents.
SHLIB_PATH	(HP-UX)	This points to the directory <code>/<Install_Dir>/EntireX/lib</code> and <code>/<Install_Dir>/EntireX/examples/lib</code> to load the shared library at runtime.
LD_LIBRARY_PATH	(Solaris and Linux)	
LIBPATH	AIX	

Setting up EntireX Security under UNIX

- [Setting up EntireX Security for Broker Kernel](#)
- [Setting up EntireX Security for Broker Stubs](#)

Note: You must set up EntireX Security for broker kernel and - if your application(s) use API version 7 or below - also for broker stubs.

Setting up EntireX Security for Broker Kernel

➤ To set up EntireX Security for broker kernel under UNIX

- 1 Determine that all prerequisites for EntireX components have been met before setting up EntireX Security. See *UNIX Prerequisites*.
- 2 Insert the following statements into the DEFAULTS=BROKER section of the Broker attribute file:
 - SECURITY=YES
- 3 Modify the DEFAULTS=SECURITY section of the Broker attribute file according to your requirements. These parameters are used to determine whether you will use UNIX local security or LDAP-based authentication. See *Security-specific Attributes* under *Broker Attributes*. If you are using LDAP-based authentication, authorization rules are not available to you.

Note: UNIX authentication utilizes the /etc/passwd and /etc/shadow files. Functions used are: `getspnam()` and/or `getpwnam()`. These functions usually do not return the encrypted password to ordinary processes; therefore, USRSEC employs a daemon process to perform these functions.

The daemon process (`sagssxauthd2`) must be owned by the “root” user (usually `uid = 0`) and have the `setuid` flag enabled. This process will automatically be started at the first authentication request and terminated when the kernel is shut down. In addition if `sagssxauthd2` is terminated while the Broker kernel is running, a new `sagssxauthd2` will be started automatically, if required.

Setting up EntireX Security for Broker Stubs

Note: If you are running your application(s) at ACI version 7 or below, the following steps are required to install EntireX Security for the broker stubs in all environments where applications execute either as clients or servers. See *List of Components per Platform* for where EntireX Security for broker stubs is supported.

These steps are not required if you are running your application(s) at ACI version 8 or above.

➤ To set up EntireX Security for broker stubs under UNIX

- Copy the module `secuexit.s[o|l]` (depending on platform) from the directory `/<Install_Dir>/EntireX/examples/lib` to the directory `/<Install_Dir>/EntireX/lib`.

Notes:

1. *Secuexit.dll* is needed for backward compatibility if your applications issue any commands using ACI version 7 or below. Applications using ACI version 8 or above do not require this additional component in the stub.
2. For encrypted transport we strongly recommend using the Secure Sockets Layer/Transport Layer Security protocol. See *SSL/TLS and Certificates with EntireX*.

Caution: If stub tracing level is “> 1”, unencrypted contents of the send/receive buffers are exposed in the trace.

Setting of EntireX Security for Broker stubs is now complete. Now you can set up the security components for the Broker stubs on the remaining operating systems where your application components are located.

Mini Runtime Considerations

The EntireX Mini Runtime is a set of components that can be used for the deployment of applications using the Broker ACI, the Broker RPC, and - under Windows only - DCOM Wrapper objects and the Broker ActiveX Control. Unlike the full EntireX Runtime, the Mini Runtime does not include Java capabilities. The Mini Runtime is provided as a separate package in the Software AG Installer.

If you need the EntireX Mini Runtime with your application, you may have to extend the path variable `LD_LIBRARY_PATH` (UNIX and Linux) or `LIBPATH` (AIX) to `<inst_root>/EntireX/lib` before starting your application.

Natural Considerations

Installing the Natural-based EntireX Broker Tutorial under UNIX

➤ To install the Tutorial

- 1 Use the Natural utility `SYSOBJH` to load all objects contained in `SYSETB.TRA` in directory `/<Install_Dir>/EntireX/etc`. See *Object Handler* in the Natural Tools and Utilities documentation for more information.
- 2 Invoke Natural, logon to library `SYSETB` and issue the `CATALL` command to catalog all the programs in the library.
