Running Broker with SSL or TLS Transport	
Setting up Entire Net-Work/Adabas SVC Transport	
Starting and Stopping the Broker	
■ Dual Command Log Files	4
■ Tracing EntireX Broker	5
■ Protecting a Broker against Denial-of-Service Attacks	
Setting the Time Zone for Broker	8

This chapter contains information on setting up the Broker under z/OS. It assumes that you have completed the relevant steps described under *Installing EntireX under z/OS* in the z/OS installation documentation.

Setting up TCP/IP Transport

The recommended way to set up the TCP/IP communicator is to define PORT=nnnn and optionally HOST=x.x.x.x|hostname and STACK-NAME=stackname under TCP/IP-specific Attributes (DEFAULTS=TCP) under Broker Attributes in the administration documentation.

However, if no port number is specified in the broker attribute file, the EntireX Broker kernel uses getservbyname to determine the TCP/IP port on which it will listen for incoming connections. The specified name is the value of BROKER-ID in the attribute file. An entry for this value must be made in the local machine's /etc/services file. Example:

```
ETBnnn yyyyy/tcp # local host
```

where *etbnnn* is the BROKER-ID and *yyyyy* is the intended port number. This is the same place from which local Broker stubs will obtain the port information. If getservbyname fails, then a default port number of 1971 will be used. This is the same default port number that the stubs use.

Running Broker with SSL or TLS Transport

Before starting the Broker, it must be configured to correctly use SSL or TLS as a transport mechanism:

- Step 1: Modify Broker-specific Attributes
- Step 2: Modify SSL-specific Attributes

Step 1: Modify Broker-specific Attributes

Append "-SSL" to the TRANSPORT attribute. For example:

DEFAULTS = BROKER TRANSPORT = TCP-SSL

See also TRANSPORT.

Step 2: Modify SSL-specific Attributes

Set the SSL or TLS attributes, for example:

```
DEFAULTS = SSL

TRUST-STORE = MYRING

KEY-LABEL = MYCERTIFICATE

VERIFY-CLIENT = N

PORT=1958
```

where 1958 is the default but can be changed to any port number.

See also *SSL-specific Attributes* (DEFAULTS=SSL) under *Broker Attributes* in the administration documentation and *SSL or TLS and Certificates with EntireX*.

Setting up Entire Net-Work/Adabas SVC Transport

To set up EntireX Net-Work communication mechanism

- 1 Ensure that all load libraries in the Broker kernel steplib are APF-authorized.
- 2 Ensure that appropriate values are supplied in the Broker attribute file section DEFAULTS=NET, paying particular attention to the IUBL parameter which specifies the maximum send/receive buffer length that can be sent between an application and Broker kernel within a single request and NABS, which governs the total amount of storage available concurrently for all users communicating over this transport mechanism. See *Adabas SVC/Entire Net-Work-specific Attributes* (DEFAULTS=NET) under *Broker Attributes* in the administration documentation.
- 3 Ensure that communication with the EntireX Broker is possible by running the installation verification programs (bcoc, bcos) using transport type NET.

Starting and Stopping the Broker

To start the Broker

- 1 Create a user ID for the started task or job where your Broker kernel is going to run.
- 2 If you are using a started task, ensure that the user ID is defined in the list of user IDs for started tasks and that the sample Broker kernel JCL is modified appropriately to create a PROC.
- 3 Start the Broker kernel either from the Broker kernel job (JCL) or started task (PROC).

To stop the Broker

■ Issue the operator command P <JOBNAME>

Or:

Execute the ETBCMD utility using the example syntax below:

```
//ETBCMD EXEC PGM=ETBCMD,
// PARM=('/-bhost:port:TCP ',
// '-cSHUTDOWN -dBROKER -xuid -ypwd')
```

See *Operator Commands* in the z/OS administration documentation for a full list and also *Broker Command-line Utilities*.

Dual Command Log Files

Command logging is a feature to assist in debugging Broker ACI applications. A command in this context represents one user request sent to the Broker and the related response of Broker.

Broker uses two command log files, enabling data to be written to one of the files while the other is being copied for archival purposes. Two file names must be specified for the dual command logs. At startup, Broker initializes both files and keeps the first open for printing command log data. Broker kernel switches to the other command log when the first file becomes full - or when the size of the open file reaches the value optionally specified by CMDLOG-FILE-SIZE (specified in KB).

Note: It is always advisable to copy the contents of a full command log file before Broker fills the subsequent command log file. Otherwise, the information in the first file (full and closed) will be overwritten.

The file requirements are two equally sized, physical sequential files defined with a record length of 121 bytes, i.e.

DCB=(LRECL=121, RECFM=PS, BLKSIZE=nnnn). We recommended you allocate files with a single (primary) extent only. For example SPACE=(CYL, (30,0)). The minimum file size is approximately 3 cylinders of 3390 device.

Alternatively, the dual command log files can be allowed in USS HFS file system.

For more information, see *Command Logging in EntireX* in the z/OS administration documentation.

Tracing EntireX Broker

This section covers the following topics:

- Broker TRACE-LEVEL Attribute
- Attribute File Trace Setting
- Deferred Tracing
- Flushing Trace Data to a GDG Data Set

Broker TRACE-LEVEL Attribute

The Broker TRACE-LEVEL attribute determines the level of tracing to be performed while Broker is running. The Broker has a master TRACE-LEVEL specified in the Broker section of the attribute file as well as several individual TRACE-LEVEL settings that are specified in the following sections of the attribute file. You can also modify the different TRACE-LEVEL values while Broker is running, without having to restart the Broker kernel for the change to take effect.

For temporary changes to TRACE-LEVEL without restarting the Broker, use the Broker command-line utility *ETBCMD*.

Individual Settings	Specified in Attribute File Section
Master trace level	DEFAULTS=BROKER
Persistent store trace level	DEFAULTS=ADABAS CTREE DIV (currently not available for DIV)
Conversion trace level	CONVERSION parameter that can be defined in DEFAULTS=BROKER SERVICE TOPIC
Security trace level	DEFAULTS=SECURITY

These individual TRACE-LEVEL values determine the level of tracing within each subcomponent. If not specified, the master TRACE-LEVEL is used.

Attribute File Trace Setting

Trace Level	Description
0	No tracing. Default value.
1	Traces incoming requests, outgoing replies, and resource usage.
2	All of Trace Level 1, plus all main routines executed.
3	All of Trace Level 2, plus all routines executed.
4	All of Trace Level 3, plus Broker ACI control block displays.
8	All of Trace Level 4, plus Adabas Persistent Store Adabas control blocks.

Note: Trace levels 2 and above should be used only when requested by Software AG support.

Deferred Tracing

It is not always convenient to run with TRACE-LEVEL defined, especially when higher trace levels are involved. Deferred tracing is triggered when a specific condition occurs - such as an ACI response code or a Broker subtask abend. Such conditions cause the contents of the trace buffer to be written, showing trace information leading up the specified event. If the specified event does not occur, the Broker trace will contain only startup and shutdown information (equivalent to TRACE-LEVEL=0). Operating the trace in this mode requires the following additional attributes in the Broker section of the attribute file. Values for TRBUFNUM and TRAP-ERROR are only examples.

Attribute	Value	Description
TRBUFNUM	3	Specifies the deferred trace buffer size = 3 * 64 K.
TRMODE	WRAP Indicates trace is not written until an event occurs.	
TRAP-ERROR	322	Assigns the event ACI response code 00780322 "PSI: UPDATE failed".

Flushing Trace Data to a GDG Data Set

With broker-specific attributes TRMODE=WRAP and TRBUFNUM=*n*, Broker writes trace data to internal buffers instead of stderr (DD:SYSOUT). These buffers are used in round-robbin mode and do not involve any I/O operation. If you need trace data for diagnostic purposes, use the operator command *FLUSH* to write the trace data from the internal buffers to a data set. A FLUSH command is performed automatically in case of error exceptions. The output data set is not readable for any other user when the broker is running. To avoid this problem, you can use a GDG (generation data group) data set as output data set. First you must allocate the GDG and define it to the broker. These preparatory steps are outlined below. The GDG name EXX.GDG is used in the examples.

Note: GDG is supported for deferred tracing only.

- Allocating a GDG
- Defining the GDG to Broker
- Writing to the GDG Data Set

Allocating a GDG

Define the GDG with IDCAMS. This definition is needed before working with the GDG data sets. You can use the following JCL to define a GDG. The LIMIT parameter is set to 16, but may contain other values according to your needs.

```
//IDCAMS EXEC PGM=IDCAMS,REGION=4096K
//SYSPRINT DD SYSOUT=*
//SYSIN DD *
   DEFINE GENERATIONDATAGROUP -
   (NAME(EXX.GDG) -
   NOEMPTY -
   SCRATCH -
   LIMIT(16))
/*
```

Defining the GDG to Broker

The GDG data set as target for trace data can be managed without changes to the Broker JCL. However, the DD statement for such a GDG data set has to be defined as a Broker attribute in order to propagate the file characteristics to the runtime library of the IBM Language Environment.

See TRACE-DD under *Broker Attributes* in the administration documentation.

Writing to the GDG Data Set

After successful broker initialization, a new data set of the GDG is allocated and opened. Based on the defined GDG name EXX.GDG in the sample JCL above, data set names EXX.GDG.G0001V00, EXX.GDG.G0002V00, EXX.GDG.G0003V00 and so on will be allocated and written.

Use operator command FLUSH to write all trace data from internal buffers to the GDG data set. The data set will be closed at the end of the FLUSH processing, and the next GDG data set is allocated and opened. During broker shutdown, the GDG data set is filled with all available trace data and closed.

Protecting a Broker against Denial-of-Service Attacks

An optional feature of EntireX Broker is available to protect a Broker running with SECURITY=YES against denial-of-service attacks. An application that is running with invalid user credentials will get a security response code. However, if the process is doing this in a processing loop, the whole system could be affected. If PARTICIPANT-BLACKLIST is set to "YES", EntireX Broker maintains a blacklist to handle such "attacks". If an application causes ten consecutive security class error codes within 30 seconds, the blacklist handler puts the participant on the blacklist. All subsequent requests from this participant are blocked until the BLACKLIST-PENALTY-TIME has elapsed.

Server Shutdown Use Case

Here is a scenario illustrating another use of this feature that is not security-related.

An RPC server is to be shut down immediately, using Broker Command and Information Services (CIS), and has no active request in the broker. The shutdown results in the LOGOFF of the server. The next request that the server receives will probably result in message 00020002 "User does not exist", which will cause the server to reinitialize itself. It was not possible to inform the server that shutdown was meant to be performed.

With the *blacklist*, this is now possible. As long as the blacklist is not switched off, when a server is shut down immediately using CIS and when there is no active request in the broker, a marker is set in the blacklist. When the next request is received, this marker results in message 00100050 "Shutdown IMMED required", which means that the server is always informed of the shutdown.

Setting the Time Zone for Broker

Broker obtains the time zone value by reading the environment variable $\top Z$. If not specified, Broker retrieves the assignment of $\top Z$ from the configuration file /etc/profile.

Check your /etc/profile for an appropriate setting of environment variable TZ. The TZ value should reflect the appropriate value for your location.

Remember that the new Daylight Saving Time rule according to the Energy Policy Act in the U.S. takes effect in 2007. If you live in an area affected by the new rule, you may append it to the TZ environment variable.

For example, TZ=EST5EDT, M4.1.0, M10.5.0 is no longer valid. TZ=EST5EDT, M3.2.0, M11.1.0 must be used instead.

If you don't want to change your /etc/profile, you may configure Broker's startup JCL to define environment variable $\top Z$. Modify the EXEC statement thus:

```
//BROKER EXEC PGM=ETBNUC, REGION=OM, TIME=1440,
// PARM='ENVAR(''TZ=EST5EDT, M3.2.0, M11.1.0'')/'
```

The value of $\top Z$ should reflect the appropriate value for your location. Please enclose the time zone value in quotation marks and parentheses, as outlined above. The rule for daylight saving time changes can be appended after the time zone value.

2 Configuring Broker for Internationalization

Configuring Translation	10
Configuring Translation User Exits	
Configuring ICU Conversion	
Configuring SAGTRPC User Exits	
Writing Translation User Exits	
Writing SAGTRPC User Exits	
■ Building and Installing ICU Custom Converters	

It is assumed that you have read the document *Internationalization with EntireX* and are familiar with the various internationalization approaches described there.

This chapter explains in detail how to configure the broker for the various internationalization approaches, how to write a translation user exit and how to write a SAGTRPC user exit.

See also What is the Best Internationalization Approach to use? under Introduction to Internationalization

Configuring Translation

To configure translation

In the Broker attribute file, set the service-specific or topic-specific broker attribute TRANSLATION to "SAGTCHA" as the name of the translation routine. Example:

TRANSLATION=SAGTCHA

Configuring Translation User Exits

To configure translation user exits

As a prerequisite, the user-written translation module must be accessible to the Broker worker threads.

- 1 Copy the user-written translation module into any library of the Broker's steplib concatenation.
- In the Broker attribute file, set the service-specific or topic-specific broker attribute TRANSLATION to the name of the user-written translation routine. Example:

TRANSLATION=MYTRANS

Configuring ICU Conversion

To configure ICU conversion

- In the Broker attribute file, set the service-specific or topic-specific broker attribute CONVERSION. Examples:
 - 1. ICU Conversion with SAGTCHA for ACI-based Programming:

CONVERSION=(SAGTCHA, TRACE=1, OPTION=SUBSTITUTE)

2. ICU Conversion with SAGTRPC for RPC-based Components and Reliable RPC:

CONVERSION=(SAGTRPC, TRACE=2, OPTION=STOP)

We recommend always using SAGTRPC for RPC data streams. *Conversion with Multibyte, Double-Byte and other Complex Codepages* will always be correct, and *Conversion with Single-byte Codepages* is also efficient because SAGTRPC detects single-byte codepages automatically. See *Conversion Details*.

- 2 Optionally configure a CONVERSION OPTION to tune error behavior to meet your requirements; see *OPTION Values for Conversion*.
- For the Broker attribute, check if ICU conversion is possible, that is, the attribute ICU-CONVER-SION is either
 - not defined, its default is YES
 - set to YES

To configure locale string defaults (optional)

■ If the broker's locale string defaults do not match your requirements (see *Broker's Locale String Defaults* under *Locale String Mapping* in the internationalization documentation), we recommend you assign suitable locale string defaults for your country and region, see the respective attribute in *Codepage-specific Attributes* (DEFAULTS=CODEPAGE) under *Broker Attributes* in the administration documentation for how to customize the broker's locale string defaults.

To customize mapping of locale strings (optional)

If the built-in locale string mapping mechanism does not match your requirements, you can assign specific codepages to locale strings. See *Broker's Built-in Locale String Mapping* under *Locale String Mapping* in the internationalization documentation and locale-string for information on customizing the mapping of locale strings to codepages.

Configuring SAGTRPC User Exits

To configure SAGTRPC user exits

As a prerequisite, the user-written conversion module must be accessible to the Broker worker threads.

- 1 Copy the user-written conversion module into any library of the Broker's steplib concatenation.
- In the Broker attribute file, set the service-specific or topic-specific broker attribute CONVERSION to the name of the user-written SAGTRPC user exit routine. Example:

CONVERSION=(MYTRANS, TRACE=1)

To configure locale string defaults

■ If the broker's locale string defaults do not match your requirements, we recommend you assign suitable locale string defaults for your country and region. See the appropriate attribute under *Codepage-specific Attributes* (DEFAULTS=CODEPAGE) under *Broker Attributes* in the administration documentation for information on customizing broker's locale string defaults, and also *Locale String Mapping* in the internationalization documentation.

To customize mapping of locale strings

■ If the broker's built-in locale string mechanism does not match your requirements, you can assign specific codepages to locale strings. See *Broker's Built-in Locale String Mapping* under

Locale String Mapping in the internationalization documentation and the appropriate attribute under Codepage-specific Attributes (DEFAULTS=CODEPAGE) under Broker Attributes in the administration documentation for information on customizing broker's locale string defaults.

Writing Translation User Exits

This section covers the following topics:

- Introduction
- Structure of the TRAP Control Block
- Using the TRAP Fields

Introduction

EntireX Broker provides an interface to enable user-written translation routines in the programming language Assembler. It contains three parameters:

- The address of the TRAP control block (TRAP = Translation Routine / Area for Parameters).
- The address of a temporary work area. It is aligned to fullword / long integer boundary (divisible by 4). The work area can only be used for temporary needs and is cleared after return.
- A fullword (long integer) that contains the length of the work area.
- **Note:** Names for user-written translation routines starting with "SAG" are reserved for Software AG usage and must not be used, e.g. "SAGTCHA" and "SAGTRPC".

Structure of the TRAP Control Block

The Assembler dummy section TR\$TRAP covers the layout of the TRAP control block:

```
TR$TRAP DSECT .
TR$TYPE DS
                  F
                               TRAP type
TR$TYP2 EQU
                               TRAP type ETB 121
TR$ILEN DS
                               Input buffer length
TR$IBUF DS
                  Α
                               Address of input buffer
TR$OLEN DS
                  F
                               Output buffer length
TR$OBUF DS
                  Α
                               Address of output buffer
TR$DLEN DS
                               Length of data returned:
                               Should be set to the minimum value of TR$ILEN
                               and TR$OLEN.
TR$SHOST DS
                               Sender's host:
                               x'00000000' = little endian
                               x'00000001' = big endian
                               Sender's character set:
TR$SCODE DS
SEBCIBM EQU
                  X'00000022'
                               EBCDIC (IBM)
SEBCSNI EQU
                  X'00000042'
                               EBCDIC (SNI)
```

SA88591 EQU TR\$RHOST DS TR\$RCODE DS TR\$BHOST DS TR\$BCODE DS TR\$SENVA DS	F F F F	ASCII Receiver's host> see TR\$SHOST Receiver's char set> see TR\$SCODE BROKER host> see TR\$SHOST BROKER char set> see TR\$SCODE Sender's ENVIRONMENT field supplied:
OFF EQU		ENVIRONMENT field not set
ON EQU *	X'0000001'	ENVIRONMENT field set
TR\$RENVA DS *	F	Receiver's ENVIRONMENT field supplied:> see TR\$SENVA
TR\$SENV DS	CL32	Sender's ENVIRONMENT field
TR\$RENV DS	CL32	Receiver's ENVIRONMENT field
TR\$LEN EQU	*-TR\$TRAP	Length of TRAP

The translation routine USRTCHA is an example of the translation user exit, it is contained in the EntireX Common source library.

Using the TRAP Fields

The TR\$DLEN must be supplied by the user-written translation routine. It tells the Broker the length of the message of the translation. In our example its value is set to the minimum length of the input and output buffer.

All other TRAP fields are supplied by the Broker and must not be modified by the user-written translation routine.

The incoming message is located in a buffer pointed to by TR\$IBUF. The length (not to be exceeded) is supplied in TR\$ILEN. The character set information from the send buffer can be taken from TR\$SCODE.

The outgoing message must be written to the buffer pointed to by TR\$0BUF. The length of the output buffer is given in the field TR\$0LEN. The character set is specified in TR\$RCODE. If the addresses given in TR\$IBUF and TR\$0BUF point to the same location, it is not necessary to copy the data from the input buffer to the output buffer.

The environment fields TR\$SENVA and TR\$RENVA are provided to handle site-dependent character set information. For the SEND and/or RECEIVE functions, you can specify data in the ENVIRONMENT field of the Broker ACI control block. This data is translated into the codepage of the platform where EntireX Broker is running (see field TR\$BCODE) and is available to the TR\$SENV or TR\$RENV field in the TRAP control block. TR\$SENVA or TR\$RENVA are set to ON if environmental data is available.

The sample source USRTCHA contains a section to handle the ENVIRONMENT value *NONE. The translation will be skipped if *NONE is supplied by the sender or receiver. Any values given in the API field ENVIRONMENT must correspond to the values handled in the translation routine.

Writing SAGTRPC User Exits

This section covers the following topics:

- Introduction
- Structure of the User Exit Control Block
- Using the User Exit Interface Fields
- Character Set and Codepage

Introduction

EntireX Broker provides an interface to SAGTRPC user exit routines written in the programming language Assembler. The interface contains three parameters:

- The address of the UE (user exit) control block.
- The address of a temporary work area. It is aligned to a fullword / long-integer boundary (divisible by 4). The work area can only be used temporarily and is cleared after return.
- A fullword (long integer) that contains the length of the work area.

Note: Names for conversion routines starting with "SAG" are reserved for Software AG usage and must not be used, e.g. "SAGTCHA" and "SAGTRPC".

Structure of the User Exit Control Block

The Assembler dummy section UE\$CB shows the layout of the user exit control block.

UE\$CB *	DSECT	,	User Exit Control Block	
* *				Direction
	DS EQU	F 1	UECB version UECB version 1	input
UE\$ILEN	DS DS	A F	Address of input buffer Input buffer length	input input
UE\$OLEN	DS DS DS	A F	Address of output buffer Output buffer length	input
* UE\$SHOST			Length of data returned Senders host:	output
* * *			x'00000000' = little endian x'00000001' = big endian	
	EQU X'(00000022'	Senders character set: EBCDIC (IBM) EBCDIC (SNI)	input

```
SA88591 EQU X'00000080' ASCII
UE$RHOST DS
               F
                        Receivers host
                                             --> see UE$SHOST
                                                                input
                        Receivers char set --> see UE$SCODE
UE$RCODE DS
                                                                input
UE$BHOST DS
                        BROKER host
                                             --> see UE$SHOST

The user-written conversion exit example USRTRPC is delivered in the EntireX common source library EXX951.SRCE. See *Contents of Mainframe Installation Medium* in the z/OS installation documentation.

Using the User Exit Interface Fields

The user exit provides two separate functions, CONVERT and GETLENGTH. The field UE\$FCT indicates the function to execute.

Errors

Both functions can send an error, using register 15 in the range 1 to 9999 to SAGTRPC together with an error text in the field UE\$ETXT.

- A value of 0 returned in register 15 means successful response.
- Error 9999 is reserved for output buffer overflow. See *CONVERT Function*.
- When an error occurs, the conversion of the message will be aborted and the error text will be sent to the receiver (client or server). The error is prefixed with the error class 1011. See Message Class 1011 User-definable SAGTRPC Conversion Exit under Error Messages and Codes.

Example:

The user exit returns 1 in register 15 and the message "Invalid Function" in UE\$ETXT. The receiver gets the error message 10110001 Invalid Function.

CONVERT Function

This function has to be executed when the contents of UE\$FCT match the definition FCTCONV.

UE\$DLEN must be supplied by SAGTRPC's user-written conversion exit. Its value must be set to the length of the output buffer.

All other interface fields are supplied by the Broker and must not be modified by SAGTRPC's user-written conversion exit.

The incoming data is located in a buffer pointed to by UE\$IBUF. UE\$ILEN defines the length.

The outgoing converted message must be written to the buffer pointed to by UE\$0BUF. The field TR\$0LEN defines the maximum length available.

For variable length data such as AV and KV, an output buffer overflow can occur if the message size increases after conversion or the receiver's receive buffer is too small. In this case error 9999 "output buffer overflow" must be returned, which calls the <code>GETLENGTH Function</code> for the remaining fields.

GETLENGTH Function

The GETLENGTH function evaluates the needed length of the output buffer after conversion. An actual conversion must not be performed. The length needed must be returned in the field UE\$OLEN.

The GETLENGTH function is called for remaining fields after the CONVERT function returned the error 9999 "output buffer overflow".

The purpose of this function is to evaluate the length needed by the receiver's receive buffer. This length is returned to the receiver in the ACI field RETURN-LENGTH. The receiver can then use the Broker ACI function RECEIVE with the option LAST together with a receive buffer large enough to reread the message.

Character Set and Codepage

The character-set information used is the same as in the user-written translation routine and is taken from UE\$SCODE (for the sender), UE\$RCODE (for the receiver) and UE\$BCODE (for the Broker). The character-set information depends on the direction information given in the field UE\$DIR. See the following table:

UE\$DIR	From Character Set	To Character Set
DIRS2B (Sender to Broker)	UE\$SCODE	UE\$BCODE
DIRS2R (Sender to Receiver)	UE\$SCODE	UE\$RCODE
DIRB2R (Broker to Receiver)	UE\$BCODE	UE\$RCODE

Alternatively, the codepage as derived from the locale string mapping process is provided in UE\$SCP (sender codepage), UE\$RCP (receiver codepage) and UE\$BCP (Broker codepage), and can be used to find the correct conversion table. See the following table and also *Locale String Mapping* in the internationalization documentation.

UE\$DIR	From Codepage	To Codepage
DIRS2B (Sender to Broker)	UE\$SCP	UE\$BCP
DIRS2R (Sender to Receiver)	UE\$SCP	UE\$RCP
DIRB2R (Broker to Receiver)	UE\$BCP	UE\$RCP

Software AG IDL Data Types to Convert

The field UE\$FMT provides the SAGTRPC user-written conversion exit with the information on the IDL data types to convert. Each data type can be handled independently.

UE\$FMT	Data to be converted	Notes
FMTA	IDL data type A	1, 3, 4
FMTAV	IDL data type AV	4, 5
FMTB	IDL data type B	1, 2, 7
FMTBV	IDL data type BV	1, 2, 7
FMTD	IDL data type D	1, 2, 7
FMTF4	IDL data type F4	1, 2, 7
FMTF8	IDL data type F8	1, 2, 7
FMTI1	IDL data type I1	1, 2, 7
FMTI2	IDL data type I2	1, 2, 7
FMTI4	IDL data type I4	1, 2, 7
FMTK	IDL data type K	1, 3, 4
FMTKV	IDL data type KV	4, 5
FMTL	IDL data type L	1, 2, 7
FMTN	IDL data type N	1, 2, 7
FMTP	IDL data type P	1, 2, 7
FMTT	IDL data type T	1, 2, 8
FMTU	IDL data type U	1, 2, 7
FMTUV	IDL data type UV	1, 2, 7
FMTUSER	RPC user data such as user ID, library, program	1, 3, 4
FMTMETA	RPC metadata	1, 2, 7
FMTFB	RPC format buffer	1, 2, 7
FMTSB	RPC metadata variable length	4, 5, 7
FMTPRE	Preview data	4, 6, 7

Notes:

- 1. Field length is constant.
- 2. The field content length must not increase or decrease during conversion. If this happens, the user exit should produce an error.
- 3. If the field content length *decreases* during the conversion, suitable padding characters (normally blanks) have to be used.
 - If the field content length *increases* during conversion and exceeds the field length, the contents must be truncated or, alternatively, the conversion can be aborted and an error produced.

- 4. If the contents are truncated, character boundaries are the responsibility of the user exit. Complete valid characters after conversion have to be guaranteed. This may be a complex task for codepages described under *Conversion with Multibyte*, *Double-Byte and other Complex Codepages*. For *Conversion with Single-byte Codepages* it is simple because the character boundaries are the same as the byte boundaries.
- 5. The field length can decrease or increase during the conversion up to the output buffer length. The new field length must be returned in UE\$DLEN. If the output buffer in the CONVERT function is too small, error 9999 must be returned to the caller.
- 6. The field buffer should continue to be converted until the output buffer is full or the input buffer has been processed. If the field content length increases or truncations occur, no error should be produced. If the field content length decreases, there should be no padding. The new field length should simply be returned to the caller.
- 7. Codepages used for RPC data streams must meet several requirements. See *Codepage Requirements* for RPC Data Stream Conversions under What is the Best Internationalization Approach to use? under Introduction to Internationalization. If these are not met, the codepage cannot be used to convert RPC data streams.

To assemble and link the SAGTRPC user-written conversion exit

- 1 Assemble the conversion exit to a module named USRTRPC. This name cannot be changed.
- Link the USRTRPC module to the supplied SAGTRPC module. You can give the resulting load module any name that does not begin with "SAG". Names starting with "SAG", such as "SAGTCHA" and "SAGTRPC", are reserved for Software AG. In the example below, the module is named "USRTRANS".

```
//LKED
         EXEC PGM=HEWL,
// PARM='LET,LIST,MAP,AMODE(31),XREF,CALL,RENT'
//SYSUT1 DD UNIT=<unit>,SPACE=(CYL,(1,1))
//SYSUT2 DD UNIT=<unit>,SPACE=(CYL,(1,1))
//SYSPRINT DD SYSOUT=*
//EXBLOAD DD DISP=SHR, DSN=EXB951.LOAD(SAGTRPC)
//USRLOAD DD DISP=SHR, DSN=<MyLoadLib>(USRTRPC)
//SYSLIN DD *
INCLUDE EXBLOAD(SAGTRPC)
 INCLUDE USRLOAD(USRTRPC)
 ORDER CEESTART
 ENTRY CEESTART
NAME USRTRANS(R)
//SYSLMOD DD DISP=SHR, DSN=. . . (USRTRANS)
//SYSIN DD DUMMY
```

Building and Installing ICU Custom Converters

User-written ICU converters (codepages) are not supported under z/OS.

3 Managing the Broker Persistent Store

Implementing an Adabas Database as Persistent Store	. 24
Implementing a DIV Persistent Store	
Migrating the Persistent Store	. 36

The persistent store is used for storing unit-of-work messages and publish-and-subscribe data to disk. This means message and status information can be recovered after a hardware or software failure to the previous commit point issued by each application component.

Under z/OS, the broker persistent store can be implemented with:

- the Adabas database of Software AG
- a VSAM linear data set (LDS) accessed using Data In Virtual (DIV)

See also Concepts of Persistent Messaging in the general administration documentation.

Implementing an Adabas Database as Persistent Store

- Introduction
- Configuring and Operating the Adabas Persistent Store
- Adabas DBA Considerations

Introduction

EntireX provides an Adabas persistent driver. This enables Broker unit of work (UOW) messages and their status to be stored in an Adabas file. It is designed to work with Adabas databases under z/OS, UNIX, Windows, BS200/OSD and z/VSE, and can be used where the database resides on a different machine to Broker kernel. For performance reasons, we recommend using Broker on the same machine as the Adabas database.

Configuring and Operating the Adabas Persistent Store

Selecting the Adabas Persistent Store Driver

The Adabas persistent store driver module is contained within the regular Broker load library or binaries directory. Module ADAPSI is activated by specifying the PSTORE-TYPE parameter. Use the supplied job EXBJ015 from data set EXX951.JOBS to define and install the persistent store file in your Adabas database. This job creates and loads the Adabas file into the database.

Restrictions

If a HOT start is performed, the Broker kernel must be executed on the same platform on which also the previous Broker executed. This is because some portions of the persistent data are stored in the native character set and format of the Broker kernel. It is also necessary to start Broker with the same Broker ID as the previous Broker executed.

If a COLD start is executed a check is made to ensure the Broker ID and platform information found in the persistent store file is consistent with the Broker being started (provided the persistent store file is not empty). This is done to prevent accidental deletion of data in the persistent store by a different Broker ID. If you intend to COLD start Broker and to utilize a persistent store file which has been used previously by a different Broker ID, you must supply the additional PSTORE-TYPE parameter FORCE-COLD=Y.

Recommendations

- Perform regular backup operations on your Adabas database. The persistent store driver writes C1 checkpoint records at each start up and shut down of Broker.
- Significant performance improvements can be achieved using Adabas/Fastpath where available. See Adabas/Fastpath documentation for details of installation and configuration of Adabas/Fastpath.
- For performance reasons, execute Broker on the same machine as Adabas.

Broker Checkpoints in Adabas

During startup, Broker writes the following C1 checkpoint records to the Adabas database. The time, date and job name are recorded in the Adabas checkpoint log. This enables Adabas protection logs to be coordinated with Broker executions. This information can be read from Adabas, using the ADAREP utility with option CPLIST:

Broker Execution Name	Broker Execution Type	Adabas
ETBC	Broker Cold Start	Normal Cold Start
ЕТВН	Broker Hot Start	Normal Hot Start
ETBT	Broker Termination	Normal Termination

Adabas DBA Considerations

- BLKSIZE: Adabas Persistent Store Parameter for Broker
- Table of Adabas Parameter Settings
- Estimating the Number of Records to be Stored
- Estimating the Number of Records to be Stored
- Tips on Transports, Platforms and Versions

BLKSIZE: Adabas Persistent Store Parameter for Broker

Caution should be exercised when defining the block size (BLKSIZE) parameter for the Adabas persistent store. This determines how much UOW message data can be stored within a single Adabas record. Therefore, do not define a much larger block size than the size of the maximum unit of work being processed by Broker. (Remember to add 41 bytes for each message in the unit of work.) The advantage of having a good fit between the unit of work and the block size is that fewer records are required for each I/O operation.

It is necessary to consider the following Adabas parameters and settings when using Adabas for the persistent store file:

Table of Adabas Parameter Settings

Topic	Description
Allowing Sufficient Adabas UQ Elements	Allow sufficient Adabas user queue (UQ) elements each time you start Broker. The Broker utilizes a number of user queue elements equal to the number of worker tasks (NUM-WORKER), plus two. Adabas timeout parameter (TNAE) determines how long the user queue elements will remain. This can be important if Broker is restarted after an abnormal termination, and provision must be made for sufficient user queue elements in the event of restarting Broker.
	Sample JCL SAGJ014 is provided in data set EXX951.JOBS for z/OS to enforce clean-up of any user queue element belonging to the previous Broker job. This JCL can be inserted into the job step before starting up Broker.
Setting Size of Hold Queue Parameters	Consideration must be given to the Adabas hold queue parameters NISNHQ and NH. These must be sufficiently large to allow Adabas to add/update/delete the actual number of records within a single unit of work.
	Example: where there are 100 message within a unit of work and the average message size is 10,000 bytes, the total unit of work size is 1 MB. If, for example, a 2 KB block size (default BLKSIZE=2000) is utilized by the Adabas persistent store driver, there will be 500 distinct records within a single Adabas commit (ET) operation, and provision must be made for this to occur successfully.
Setting Adabas TT Parameter	Consideration must be given to the Adabas transaction time (TT) parameter for cases where a large number of records is being updated within a single unit of work.

Topic	Description
Defining LWP Size	Sufficient logical work pool (LWP) size must be defined so that the Adabas persistent store can update and commit the units of work. Adabas must be able to accommodate this in addition to any other processing for which it is used.
Executing Broker Kernel and Adabas Nucleus on Separate Machines	If Broker kernel is executed on a separate machine to the Adabas nucleus, with a different architecture and codepage, then we recommend running the Adabas nucleus with the UEC (universal conversion) option in order to ensure that Adabas C1 checkpoints are legible within the Adabas checkpoint log.
Setting INDEXCOMPRESSION=YES	This Adabas option can be applied to the Adabas file to reduce by approximately 50% the amount of space consumed in the indexes. This is the default setting in job EXBJ015, which is supplied in data set EXX951.JOBS to define the Adabas persistent store file.
4-byte ISNs	If you anticipate having more than 16 million records within the persistent store file, you must use 4-byte ISNs when defining the Adabas file for EntireX.
Specification of Adabas LP Parameter	Caution: This parameter must be specified large enough to allow the largest
	UOW to be stored in Adabas.
	If this is not large enough, Broker will detect an error (response 9; subresponse - 4 bytes - X'0003',C'LP') and Broker will not be able to write any further UOWs.
	See the description of the LP parameter under <i>ADARUN Parameters</i> in the <i>DBA Reference Summary</i> of the Adabas z/OS documentation.

Estimating the Number of Records to be Stored

To calculate the Adabas file size it is necessary to estimate the number of records being stored. As an approximate guide, there will be one Adabas record (500 bytes) for each unprocessed unit of work, plus also n records containing the actual message data, which depends on the logical block size and the size of the unit of work. In addition, there will be one single record (500 bytes) for each unit of work having a persisted status.

Always allow ample space for the Adabas persistent store file since the continuous operation of Broker relies of the availability of this file to store and retrieve information.

Note: If the Adabas file space is exceeded, no new units of work will be accepted.

Estimating the Number of Records to be Stored

In this example there are 100,000 Active UOW records at any one time. Each of these is associated with two message records containing the message data. UOW records are 500 bytes in length. Each message record contains 2,000 bytes. In addition, there are 500,000 UOW status records residing in the persistent store, for which the UOW has already been completely processed. These are 500 bytes long.

Note: The actual size of the data stored within the UOW message records is the sum of all the messages within the UOW, plus a 41-byte header for each message. Therefore, if the

average message length is 59 bytes, the two 2,000 bytes, messages records, could contain n = 4,000 / (59+41), or 40 messages. Adabas is assumed to compress the message data by 50% in the example (this can vary according to the nature of the message data).

3-byte ISNs and RABNs are assumed in this example. A device type of 8393 is used; therefore, the ASSO block size is 4,096, and DATA block size is 27,644. Padding factor of 10% is specified.

The following example calculates the space needed for Normal Index (NI), Upper Index (UI), Address Converter (AC) and Data Storage (DS).

Calculation Factors	Required Space
■ Number entries for descriptor WK	= number UOW records: 0.1 + 0.5 million
(21-byte unique key)	+ number message records: 0.2 million
■ NI Space for descriptor WK	= 800,000 * (3 + 21 + 2)
(3-byte ISN)	■ = 20,800,000 bytes
(4,092 ASSO block 10% padding)	■ = 5,648 blocks
■ UI Space for descriptor WK	= 5,648 * (21 + 3 + 3 + 1)
(3-byte ISN + 3-byte RABN)	■ = 158,140 bytes
(4,092 ASSO block 10% padding)	■ = 43 blocks
Number entries for descriptor WI	= number processed UOW records: 0.5
(8-byte unique key)	million
■ NI Space for descriptor WI	= 500,000 * (3 + 8 + 2)
(3-byte ISN)	■ = 6,500,000 bytes
(4,092 ASSO block 10% padding)	■ = 1,765 blocks
■ UI Space for descriptor WI	= 17,649 * (8 + 3 + 3 + 1)
(3-byte ISN and 3 byte RABN)	■ = 26,475 bytes
(4,092 ASSO block 10% padding)	■ = 8 blocks
Number entries for descriptor WL	= number UOW records 0.1 + 0.5 million
(96 byte key)	
■ NI Space for descriptor WL	= = 600,000 * (3 + 96 + 2)
(3-byte ISN)	■ = 60,600,000 bytes
■ (4,092 ASSO block 10% padding)	■ = 16,455 blocks
■ UI Space for descriptor WL	= 164,548 * (96 + 3 + 3 + 1)

Calculation Factors	Required Space
(3-byte ISN and 3 byte RABN)	■ = 16,948,517 bytes
(4,092 ASSO block 10% padding)	■ = 461 blocks
Address Converter space	= = (800,000 + 1) * 3 / 4092
(4,092 ASSO block)	■ = 587 blocks
■ Data storage for message data	\blacksquare = 0.2 million * 2000 * 0.5 = 200,000,000 bytes
(2,000-byte records compressed by 50%)	
■ Data storage for UOW data	= = 0.6 million * 500 * 0.5 = 150,000,000 byte
(2,000-byte records compressed by 50%)	
Combined space required for data	■ = 14,068 blocks
(27,644 DATA block 10% padding)	
Entity Requiring Space	Total Required Space
Normal Index (NI)	= 23,868 blocks
Upper Index (UI)	= 512 blocks

Address Converter (AC)	= 587 blocks

Tips on Transports, Platforms and Versions

■ Entire Net-Work

If you intend to use Adabas persistent store through Entire Net-Work, see the Entire Net-Work documentation for installation and configuration details.

Adabas Versions

Adabas persistent store can be used on all Adabas versions currently released and supported by Software AG.

■ Prerequisite Versions of Entire Net-Work with Adabas

See the Adabas and Entire Net-Work documentation to determine prerequisite versions of Entire Net-Work to use with Adabas at your site.

Implementing a DIV Persistent Store

- Introduction
- Format Parameters
- DIV Persistent Store: Operations Using IDCAMS

Introduction

The persistent store is implemented as a VSAM linear data set (LDS) accessed using Data In Virtual (DIV). This DIV persistent store is a container for units of work and publications. Publish and subscribe data may have persistent data and status, or just persistent status.

DIV is an access method that utilizes the system paging facilities for fast I/O to and from an LDS. Performance is best if the LDS is placed on the fastest storage device available such as those used for paging. An LDS may span multiple volumes.

The DIV persistent store has an internal structure that is formatted by EntireX Broker during a COLD start (see the PSTORE Broker attribute). This format is controlled by format parameter statements that the Broker reads from the attribute file. See *DIV-specific Attributes* (DEFAULTS=DIV) under *Broker Attributes* in the administration documentation.

Persistent store data sets are maintained using the IBM z/OS utility IDCAMS. See *Operations using IDCAMS* under *Managing the Broker Persistent Store* in the z/OS administration documentation for more information.

Format Parameters

The persistent store format parameters define how a persistent store is formatted during a cold start operation and how it is accessed during all operations. These parameters are supplied in the attribute file section *DIV-specific Attributes*. Knowledge of the application usage of units of work (UOWs) will be very helpful in selecting appropriate values for the parameters used to define the persistent store.

Note: This section describes all DIV-related broker attributes. However, if you run your broker with PSTORE-VERSION=4, only the following attributes are required:

- STORE
- DDNAME
- DATASPACE NAME
- DATASPACE PAGES

All other DIV-specific attributes are obsolete with PSTORE-VERSION=4.

This section covers the following topics:

- Parameter Descriptions
- Table of Persistent Store Format Parameters
- Sample Definitions of Format Parameters

Parameter Descriptions

The persistent store format parameters file must begin with the word DEFINE, followed by "parameter name parameter value" specifications. Each parameter name must be separated from the parameter value by whitespace (blanks, tabs, or new lines). Comments may be added to the file. A comment begins with /* and ends with */ just as in the C language. The parameters must be entered in uppercase. In the following parameter descriptions, lowercase is used to denote variables:

```
DEFINE STORE name

DDNAME ddname

DATASPACE NAME name-of-dataspace

DATASPACE PAGES count-of-pages

ATTRIBUTE CELL SIZE size-of-one-attribute-cell

ATTRIBUTE CELL COUNT initial-number-of-cells-to-allocate

OID SIZE size-of-object-identifier

HASH MODULUS size-of-primary-index-array

HASH CELL COUNT initial-number-of-cells-to-allocate

CELL POOL NAME cell-pool-name

SIZE size-of-one-cell

COUNT initial-number-of-cells-to-allocate
```

Notes:

- The following parameters are always used by the persistent store component:
 - STORE
 - DDNAME
 - DATASPACE NAME
 - DATASPACE PAGES

All other parameters are used only during a persistent store cold start.

Table of Persistent Store Format Parameters

Parameter	Value	Opt/ Req	Description
STORE	up to 8 alphanumeric characters	R	Defines an internal name that is used to identify the persistent store.
DDNAME	up to 8 alphanumeric characters	R	Defines the JCL DDNAME that will be used to access the persistent store
DATASPACE NAME	DSPSTORE	0	Defines the name of the data space that will be used to map the persistent store.
			The maximum size of the DATASPACE name is up to 8 characters.
DATASPACE PAGES	2048	0	defines the size of the data space used to map the persistent store. This parameter value is increased by a factor of four before requesting the dataspace. A data space has a maximum size of two gigabytes. The maximum value for the count-of-pages is 131070.
			Note: The size of the linear data set (LDS) should be 16K times the value specified for DATASPACE PAGES. For example, 16K * 2048 = 32768K = 32M would be the LDS size needed to contain the default number of pages. Less than the required amount will cause initialization to fail; more will be unused space.
ATTRIBUTE CELL SIZE	512	0	Specifies the size of a single attribute cell, in bytes. Use only as directed by Software AG support.
ATTRIBUTE	1000	0	Specifies the initial number of cells to allocate for the status of units of work. Each cell contains the status of one unit of work. The pool will expand as needed until the maximum has been reached.
			The maximum possible number of extents for this cell pool is equal to the maximum total number of cell pool extents for the persistent store minus the number of currently allocated cell pool extents plus the number of currently allocated cell pool extents for this specific cell pool.
			The expansion increment for the ATTRIBUTE CELL COUNT is the same as the initial value.
OID SIZE	16	0	Use this parameter only when requested by Software AG support. If omitted, this parameter defaults to 16 bytes.
HASH MODULUS	13	0	Defines the size of the primary index array which partitions the OID name space through a hashing function using this modulus value.
			The use of this parameter has an impact on performance that is not easily predicted. Large values generally decrease the amount of search time required to find an object in the store by decreasing the probability of multiple OIDs hashing to the same value. Such hash

Parameter	Value	Opt/ Req	Description
			synonyms are resolved by searching a linked list. Large values require additional storage. Experience has shown that prime numbers result in the most random dispersion and thus the best performance.
HASH CELL COUNT	10	O	Defines the initial number of cells to allocate for the persistent store's hash index. Each cell may contain up to 160 index entries. Cells are linked as needed to contain synonyms resulting from the hashing function. The pool will expand as needed until the maximum has been reached.
			The maximum possible number of extents for this cell pool is equal to the maximum total number of cell pool extents for the persistent store minus the number of currently allocated cell pool extents plus the number of currently allocated cell pool extents for this specific cell pool.
			The expansion increment for the HASH CELL COUNT is the same as the initial value.
CELL POOL NAME SIZE COUNT	One cell pool named PSDDATCP will be created	O	Defines a cell pool to be used to contain unit of work data. It specifies the name of the cell pool, the size of a single cell, and the initial number of cells to be allocated. Multiple, i.e., zero to five, clauses may be specified.
	with a size of 512 bytes per cell and an initial allocation of 32 cells.		If the application supports a wide variation in unit of work sizes, multiple cell pools can be defined with cell sizes and counts that match the variation. The persistent store will attempt to find the best fit between a unit of work and a cell pool. The maximum value for the initial-number-of-cells-to-allocate count is 31360. If a larger value is requested, then the maximum value is substituted instead.
			The pool will expand as needed until the maximum has been reached.
			The maximum possible number of extents for this cell pool is equal to the maximum total number of cell pool extents for the persistent store minus the number of currently allocated cell pool extents plus the number of currently allocated cell pool extents for this specific cell pool.
			The expansion increment for the CELL POOL COUNT is the same as the initial value.

Note: The total number of cell pool extents for the persistent store is equal to the number of cell pools (user plus system defined) times 4. Currently, the maximum total number of cell pool extents is 28. A cell pool extent will be added as necessary until the maximum total number for the persistent store is reached.

Sample Definitions of Format Parameters

Example 1: Minimum specification:

```
DEFAULTS = DIV
DIV = "DEFINE STORE PSD01 DDNAME STORE01"
```

Example 2: How to create a small persistent store for testing or for a lightly loaded application with small units of work:

```
DEFAULTS = DIV
DIV = "DEFINE STORE PSD01
DDNAME STORE01
DATASPACE PAGES 1024
CELL POOL NAME CPUOW01 SIZE 128 COUNT 1000"
```

Example 3: How to define a persistent store for an application that supports a wide variety of unit of work sizes:

```
DEFAULTS = DIV

DIV = "DEFINE STORE PSD01

DDNAME STORE01

DATASPACE PAGES 4096

HASH CELL COUNT 126

HASH MODULUS 503

CELL POOL NAME CPUOW01 SIZE 128 COUNT 1000

CELL POOL NAME CPUOW02 SIZE 256 COUNT 500

CELL POOL NAME CPUOW03 SIZE 4096 COUNT 100

CELL POOL NAME CPUOW04 SIZE 16384 COUNT 10

CELL POOL NAME CPUOW05 SIZE 65536 COUNT 5"
```

DIV Persistent Store: Operations Using IDCAMS

This section covers the following topics:

- Defining a Persistent Store Linear Data Set
- Printing a Persistent Store for Diagnosis
- Copying a Persistent Store for Backup or Diagnosis

■ Sample IDCAMS JCL

Defining a Persistent Store Linear Data Set

The following IDCAMS statement can be used to allocate the persistent store. It assumes that the local environment is using z/OS SMS for data management. SMS allows for simple definition, but it may not be used at your site or it may not provide optimal performance. You may therefore need to modify the following statement under the direction of your local system administrator:

```
DEFINE CLUSTER (NAME(dsn_pstore) -
MEGABYTES(15,5) -
SHAREOPTIONS(1,3) - /*this is required*/
LINEAR) /*this is required*/
```

where *dsn_pstore* is the DSNAME you chose for the PSTORE linear data set (LDS).

Note: The size of the linear data set (LDS) should be 16K times the value specified for DATASPACE PAGES. For example, 16K * 2048 = 32768K = 32M would be the LDS size needed to contain the default number of pages. Less than the required amount will cause initialization to fail; more will be unused space.

Printing a Persistent Store for Diagnosis

The following statement lists the catalog information for the linear data set:

```
LISTCAT ENTRIES(dsn_pstore) ALL
```

where *dsn_pstore* is the DSNAME you chose for the PSTORE linear data set (LDS).

The following statement prints the contents of a persistent store in dump format:

```
PRINT IDS(dsn_pstore) DUMP
```

Copying a Persistent Store for Backup or Diagnosis

```
REPRO IDS(dsn_pstore) ODS(your_backup_name)
```

Sample IDCAMS JCL

Sample JCL is provided as member IDCAMS in the installation source library. Each operation is contained in a separate DD. To select an operation, modify the SYSIN DD DDNAME= to the name of the DD enclosing the statements to be selected.

Migrating the Persistent Store

The contents of EntireX Broker's persistent store can be migrated to a new persistent store in order to change the PSTORE type or to use the same type of PSTORE with increased capacity.

The migration procedure outlined here requires two Broker instances started with a special RUN-MODE parameter. One Broker unloads the contents of the persistent store and transmits the data to the other Broker, which loads data into the new PSTORE. Therefore, for the purposes of this discussion, we will refer to an *unload* Broker and a *load* Broker.

This procedure is based on Broker-to-Broker communication to establish a communication link between two Broker instances. It does not use any conversion facilities, since the migration procedure is supported for homogeneous platforms only.

- Configuration
- Migration Procedure

Configuration

The migration procedure requires two Broker instances started with the RUN-MODE parameter. The unload Broker should be started with the following attribute:

RUN-MODE=PSTORE-UNLOAD

The load Broker should be started with the following attribute:

RUN-MODE=PSTORE-LOAD

These commands instruct the Broker instances to perform the PSTORE migration.

Note: The attribute PARTNER-CLUSTER-ADDRESS must be defined in both Broker instances to specify the transport address of the load Broker. The unload Broker must know the address of the load broker, and the load Broker must in turn know the address of the unload Broker.

Example:

Broker ETB001 performs the unload on host HOST1, and Broker ETB002 performs the load on host HOST2. The transmission is based on TCP/IP. Therefore, Broker ETB001 starts the TCP/IP

communicator to establish port 1971, and Broker ETB002 starts the TCP/IP communicator to establish port 1972.

For ETB001, attribute PARTNER-CLUSTER-ADDRESS = HOST2:1972:TCP is set, and for ETB002, attribute PARTNER-CLUSTER-ADDRESS = HOST1:1971:TCP is set to establish the Broker-to-Broker communication between the two Broker instances.

In addition to attributes RUN-MODE and PARTNER-CLUSTER-ADDRESS, a fully functioning Broker configuration is required when starting the two Broker instances. To access an existing PSTORE on the unloader side, you must set the attribute PSTORE = HOT. To load the data into the new PSTORE on the loader side, you must set the attribute PSTORE = COLD. The load process requires an empty PSTORE at the beginning of the load process.

Note: Use caution not to assign PSTORE = COLD to your unload Broker instance, as this startup process will erase all data currently in the PSTORE.

For the migration process, the unload Broker and the load Broker must be assigned different persistent stores.

A report can be generated to detail all of the contents of the existing persistent store. At the end of the migration process, a second report can be run on the resulting new persistent store. These two reports can be compared to ensure that all contents were migrated properly. To run these reports, set the attribute PSTORE-REPORT=YES. See PSTORE for detailed description, especially for the file assignment.

Migration Procedure

The migration procedure is made up of three steps.

Step 1

The unload Broker and the load Broker instances can be started independently of each other. Each instance will wait for the other to become available before starting the unload/load procedure.

The unload Broker instance sends a handshake request to the load Broker instance in order to perform an initial compatibility check. This validation is performed by Broker according to platform architecture type and Broker version number. The handshake ensures a correctly configured partner cluster address and ensures that the user did not assign the same PSTORE to both Broker instances. If a problem is detected, an error message will be issued and both Broker instances will stop.

Step 2

The unload Broker instance reads all PSTORE data in a special non-destructive raw mode and transmits the data to the load Broker instance. The load Broker instance writes the unchanged raw data to the new PSTORE. A report is created if PSTORE-REPORT=YES is specified, and a valid output file for the report is specified.

Step 3

The unload Broker instance requests a summary report from the load Broker instance to compare the amount of migrated data. The result of this check is reported by the unload Broker instance and the load Broker instance before they shut down.

When a Broker instances is started in RUN-MODE = PSTORE-LOAD or RUN-MODE = PSTORE-UNLOAD, the Broker instances only allow Administration requests. All other user requests are prohibited.

Notes:

- 1. The contents of the persistent store are copied to the new persistent store as an exact replica. No filtering of unnecessary information will be performed, for example, UOWs in received state. The master records will not be updated.
- 2. Before restarting your Broker with the new persistent store, be sure to change your PSTORE attribute to PSTORE=HOT. *Do not* start your broker with the new persistence store using PSTORE = COLD; this startup process will erase all of the data in your persistent store.
- 3. After completing the migration process and restarting your Broker in a normal run-mode, it is important not to bring both the new PSTORE and the old PSTORE back online using separate Broker instances; otherwise, applications would receive the same data twice. Once the migration process is completed satisfactorily, and is validated, the old PSTORE contents should be discarded.

4 Broker Resource Allocation

General Considerations	40
Specifying Global Resources	41
Restricting the Resources of Particular Services	
Specifying Attributes for Privileged Services	
Maximum Units of Work	
Calculating Resources Automatically	44
Dynamic Memory Management	47
Dynamic Worker Management	
Storage Report	
Maximum TCP/IP Connections per Communicator	

The EntireX Broker is a multithreaded application and communicates among multiple tasks in memory pools. If you do not need to restrict the memory expansion of EntireX Broker, we strongly recommend you enable the dynamic memory management in order to handle changing workload appropriately. See *Dynamic Memory Management* under *Broker Resource Allocation* in the general administration documentation below. If dynamic memory management is disabled, non-expandable memory is allocated during startup to store all internal control blocks and the contents of messages.

General Considerations

Resource considerations apply to both the global and service-specific levels:

- Dynamic assignment of global resources to services that need them prevents the return of a "Resource Shortage" code to an application when resources are available globally. It also enables the EntireX Broker to run with fewer total resources, although it does not guarantee the availability of a specific set of resources for a particular service.
- Flow control ensures that individual services do not influence the behavior of other services by accident, error, or simply overload. This means that you can restrict the resource consumption of particular services in order to shield the other services.

In order to satisfy both global and service-specific requirements, the EntireX Broker allows you to allocate resources for each individual service or define global resources which are then allocated dynamically to any service that needs them.

The resources in question are the number of conversations, number of servers, plus units of work and the message storage, separated in a long buffer of 4096 bytes and short buffer of 256 bytes. These resources are typically the bottleneck in a system, especially when you consider that non-conversational communication is treated as the special case of "conversations with a single message only" within the EntireX Broker.

Global resources are defined by the parameters in the Broker section of the attribute file. The number of conversations allocated to each service is defined in the service-specific section of the attribute file. Because the conversations are shared by all servers that provide the service, a larger number of conversations should be allocated to services that are provided by more than one server. The number of conversations required is also affected by the number of clients accessing the service in parallel.

Specifying Global Resources

You can specify a set of global resources with no restrictions on which service allocates the resources:

- Specify the global attributes with the desired values.
- Do not specify any additional restrictions. That is, do not provide values for the following Broker-specific attributes:

```
LONG-BUFFER-DEFAULT
SHORT-BUFFER-DEFAULT
CONV-DEFAULT
SERVER-DEFAULT
```

Also, do not provide values for the following server-specific attributes:

```
LONG-BUFFER-LIMIT
SERVER-LIMIT
SHORT-BUFFER-LIMIT
CONV-LIMIT
```

Example

The following example defines global resources. If no additional definitions are specified, resources are allocated and assigned to any server that needs them.

```
NUM-CONVERSATION=1000

NUM-LONG-BUFFER=200

NUM-SHORT-BUFFER=2000

NUM-SERVER=100
```

Restricting the Resources of Particular Services

You can restrict resource allocation for particular services in advance:

- Use CONV-LIMIT to limit the resource consumption for a specific service.
- Use CONV-DEFAULT to provide a default limit for services for which CONV-LIMIT is not defined.

Example

In the following example, attributes are used to restrict resource allocation:

```
DEFAULTS=BROKER
NUM-CONVERSATION=1000
CONV-DEFAULT=200

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, CONV-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, CONV-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

- Memory for a total of 1000 conversions is allocated (NUM-CONVERSATION=1000).
- Service A (CLASS A, SERVER A, SERVICE A) is limited to 100 conversation control blocks used simultaneously (CONV-LIMIT=100). The application that wants to start more conversations than specified by the limit policy will receive a "Resource shortage" return code. This return code should result in a retry of the desired operation a little later, when the resource situation may have changed.
- Service B (CLASS B, SERVER B, SERVICE B) is allowed to try to allocate as many resources as necessary, provided the resources are available and not occupied by other services. The number of conversations that may be used by this service is unlimited (CONV-LIMIT =UNLIM).
- Service C (CLASS C,SERVER C,SERVICE C) has no explicit value for the CONV-LIMIT attribute. The number of conversation control blocks that it is allowed to use is therefore limited to the default value which is defined by the CONV-DEFAULT Broker attribute.

The same scheme applies to the allocation of message buffers and servers:

■ In the following example, long message buffers are allocated using the keywords NUM-LONG-BUFFER, LONG-BUFFER-DEFAULT and LONG-BUFFER-LIMIT:

```
DEFAULTS=BROKER
NUM-LONG-BUFFER=2000
LONG-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, LONG-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, LONG-BUFFER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

■ In the following example, short message buffers are allocated using the keywords NUM-SHORT-BUFFER, SHORT-BUFFER-DEFAULT and SHORT-BUFFER-LIMIT:

```
DEFAULTS=BROKER
NUM-SHORT-BUFFER=2000
SHORT-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SHORT-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, SHORT-BUFFER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

■ In the following example, servers are allocated using the keywords NUM-SERVER, SERVER-DEFAULT and SERVER-LIMIT:

```
DEFAULTS=BROKER
NUM-SERVER=2000
SERVER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SERVER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B, SERVER-LIMIT=UNLIM
CLASS=C, SERVER=C, SERVICE=C
```

Specifying Attributes for Privileged Services

If privileged services (services with access to unlimited resources) exist, specify "UNLIMITED" for the attributes CONV-LIMIT, SERVER-LIMIT, LONG-BUFFER-LIMIT and SHORT-BUFFER-LIMIT in the service-specific section of the attribute file.

For example:

```
DEFAULTS=SERVICE
CONV-LIMIT=UNLIM
LONG-BUFFER-LIMIT=UNLIM
SHORT-BUFFER-LIMIT=UNLIM
SERVER-LIMIT=UNLIM
```

To ensure a resource reservoir for peak load of privileged services, define more resources than would normally be expected by specifying larger numbers for the Broker attributes that control global resources:

NUM-SERVER
NUM-CONVERSATION
CONV-DEFAULT
LONG-BUFFER-DEFAULT
SHORT-BUFFER-DEFAULT
SERVER-DEFAULT

Maximum Units of Work

The maximum number of units of work (UOWs) that can be active concurrently is specified in the Broker attribute file. The MAX-UOWS attribute can be specified for the Broker globally as well as for individual services. It cannot be calculated automatically. If a service is intended to process UOWs, a MAX-UOWS value must be specified.

If message processing only is to be done, specify MAX-UOWS=0 (zero). The Broker (or the service) will not accept units of work, i.e., it will process only messages that are not part of a UOW. Zero is used as the default value for MAX-UOWS in order to prevent the sending of UOWs to services that are not intended to process them.

Calculating Resources Automatically

To ensure that each service runs without impacting other services, allow the EntireX Broker to calculate resource requirements automatically:

- Ensure that the attributes that define the default total for the Broker and the limit for each service are not set to UNLIM.
- Specify AUTO for the Broker attribute that defines the total number of the resource.
- Specify a suitable value for the Broker attribute that defines the default number of the resource.

The total number required will be calculated from the number defined for each service. The resources that can be calculated this way are Number of Conversations, Number of Servers, Long Message Buffers and Short Message Buffers.

Avoid altering the service-specific definitions at runtime. Doing so could corrupt the conversation consistency. Applications might receive a message such as "NUM-CONVERSATIONS reached" although the addressed service does not serve as many conversations as defined. The same applies to the attributes that define the long and short buffer resources.

Automatic resource calculation has the additional advantage of limiting the amount of memory used to run the EntireX Broker. Over time, you should be able to determine which services need more resources by noting the occurrence of the return code "resource shortage, please retry". You can then increase the resources for these services. To avoid disruption to the user, you could instead

allocate a relatively large set of resources initially and then decrease the values using information gained from the Administration Monitor application.

Number of Conversations

To calculate the total number of conversations automatically, ensure that the CONV-DEFAULT Broker attribute and the CONV-LIMIT service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify NUM-CONVERSATION=AUTO and an appropriate value for the CONV-DEFAULT Broker attribute. The total number of conversations will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-CONVERSATION=AUTO
CONV-DEFAULT=200

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A
CLASS=B, SERVER=B, SERVICE=B, CONV-LIMIT=100
CLASS=C, SERVER=C, SERVICE=C
```

- Service A and Service C both need 200 conversations (the default value). Service B needs 100 conversations (CONV-LIMIT=100).
- Because NUM-CONVERSATIONS is defined as AUTO, the broker calculates a total of 500 conversations (200 + 200 + 100).
- NUM-CONVERSATIONS=AUTO allows the number of conversations to be flexible without requiring additional specifications. It also ensures that the broker is started with enough resources to meet all the demands of the individual services.
- "AUTO" and "UNLIM" are mutually exclusive. If CONV-DEFAULT or a single CONV-LIMIT is defined as UNLIM, the EntireX Broker cannot determine the number of conversations to use in the calculation, and the EntireX Broker cannot be started.

Number of Servers

To calculate the number of servers automatically, ensure that the SERVER-DEFAULT Broker attribute and the SERVER-LIMIT service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify NUM-SERVER-AUTO and an appropriate value for the SERVER-DEFAULT Broker attribute. The total number of server buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-SERVER=AUTO
SERVER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, SERVER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B
CLASS=C, SERVER=C, SERVICE=C
```

Long Message Buffers

To calculate the number of long message buffers automatically, ensure that the LONG-BUFFER-DE-FAULT Broker attribute and the LONG-BUFFER-LIMIT service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify NUM-LONG-BUFFER=AUTO and an appropriate value for the LONG-BUFFER-DEFAULT Broker attribute. The total number of long message buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-LONG-BUFFER=AUTO
LONG-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A, LONG-BUFFER-LIMIT=100
CLASS=B, SERVER=B, SERVICE=B
CLASS=C, SERVER=C, SERVICE=C
```

Short Message Buffers

To calculate the number of short message buffers automatically, ensure that the <code>SHORT-BUFFER-DEFAULT</code> Broker attribute and the <code>SHORT-BUFFER-LIMIT</code> service-specific attribute are not set to UNLIM anywhere in the attribute file. Specify <code>NUM-SHORT-BUFFER=AUTO</code> and an appropriate value for the <code>SHORT-BUFFER-DEFAULT</code> Broker attribute. The total number of short message buffers will be calculated using the value specified for each service.

For example:

```
DEFAULTS=BROKER
NUM-SHORT-BUFFER=AUTO
SHORT-BUFFER-DEFAULT=250

DEFAULTS=SERVICE
CLASS=A, SERVER=A, SERVICE=A
CLASS=B, SERVER=B, SERVICE=B, SHORT-BUFFER-LIMIT=100
CLASS=C, SERVER=C, SERVICE=C
```

Dynamic Memory Management

Dynamic memory management is a feature to handle changing Broker workload without any restart of the Broker task. It increases the availability of the Broker by using various memory pools for various Broker resources and by being able to use a variable number of pools for the resources.

If more memory is needed than currently available, another memory pool is allocated for the specific type of resource. If a particular memory pool is no longer used, it will be deallocated.

The following Broker attributes can be omitted if DYNAMIC-MEMORY-MANAGEMENT=YES has been defined:

- NUM-CLIENT
- NUM-CMDLOG-FILTER
- NUM-COMBUF
- NUM-CONV[ERSATION]
- NUM-LONG[-BUFFER]
- NUM-PUBLICATION
- NUM-PUBLISHER
- NUM-SERVER
- NUM-SERVICE
- NUM-SERVICE-EXTENSION
- NUM-SHORT[-BUFFER]
- NUM-SUBSCRIBER
- NUM-SUBSCRIBER-TOTAL
- NUM-TOPIC
- NUM-TOPIC-EXTENSION
- NUM-TOPIC-TOTAL
- NUM-UOW | MAX-UOWS | MUOW
- NUM-WOE

If you want statistics on allocation and deallocation operations in Broker, you can configure Broker to create a storage report with the attribute STORAGE-REPORT. See *Storage Report* below.

Note: To ensure a stabile environment, some pools of Broker are not deallocated automatically. The first pools of type COMMUNICATION, CONVERSATION, CONNECTION, HEAP, PARTICIPANT, PARTICIPANT EXTENSION, SERVICE ATTRIBUTES, SERVICE, SERVICE EXTENSION, TIMEOUT QUEUE, TRANSLATION, WORK QUEUE are excluded from the automatic deallocation even when

they have not been used for quite some time. Large pools cannot be reallocated under some circumstances if the level of fragmentation in the address space has been increased in the meantime.

Dynamic Worker Management

Dynamic worker management is a feature to handle the fluctuating broker workload without restarting the Broker task. It adjusts the number of running worker tasks according to current workload. The initial portion of worker tasks started at Broker startup is still determined by NUM-WORKER.

If more workers are needed than currently available, another worker task is started. If a worker task is no longer needed, it will be stopped.

The following Broker attributes are used for the configuration if DYNAMIC-WORKER-MANAGEMENT=YES has been defined:

- WORKFR-MAX
- WORKER-MIN
- WORKER-NONACT
- WORKER-QUEUE-DEPTH
- WORKER-START-DELAY

The following two attributes are very performance-sensitive:

- Attribute WORKER-QUEUE-DEPTH defines the number of unassigned user requests in the input queue before a new worker task is started.
- Attribute WORKER-START-DELAY defines the time between the last worker task startup and the next check for another possible worker task startup. It is needed to consider the time for activating a worker task.

Both attributes depend on the environment, in particular the underlying operating system and the hardware. The goal is to achieve high-performance user request processing without starting too many worker tasks.

A good starting point to achieve high performance is not to change the attributes and to observe the performance of the application programs after activating the dynamic worker management.

If broker attribute DYNAMIC-WORKER-MANAGEMENT=YES is set, operator commands are available under z/OS to deactivate and subsequently reactivate dynamic worker management.

The following section illustrates the two different modes of dynamic worker management:

■ Scenario 1

```
DYNAMIC-WORKER-MANAGEMENT=YES

NUM-WORKER = 5

WORKER-MIN = 1

WORKER-MAX = 32
```

Broker is started with 5 worker tasks and then dynamically varies the number of worker tasks within the range from WORKER-MIN=1 to WORKER-MAX=32 due to DYNAMIC-WORKER-MANAGEMENT=YES.

■ Scenario 2

```
DYNAMIC-WORKER-MANAGEMENT=NO
NUM-WORKER = 5
WORKER-MIN = 1
WORKER-MAX = 32
```

Broker is started with 5 worker tasks. The WORKER-MIN/MAX attributes are ignored due to DYNAMIC-WORKER-MANAGEMENT=NO.

Storage Report

You can create an optional report file that provides details about all activities to allocate or to deallocate memory pools. This section details how to create the report and provides a sample report.

- Creating a Storage Report
- Platform-specific Rules
- Sample Storage Report

See also Broker-specific attribute STORAGE-REPORT.

Creating a Storage Report

Use Broker's global attribute STORAGE-REPORT with the value YES. If attribute value YES is supplied, all memory pool operations will be reported if the output mechanism is available. If the value NO is specified, no report will be created.

Platform-specific Rules

DDNAME ETBSREP assigns the report file. Format RECFM=FB, LRECL=121 is used.

Sample Storage Report

The following is an excerpt from a sample STORAGE report.

Header	Description
Identifier	Name of the memory pool.
Address	Start address of the memory pool.
Size	Size of the memory pool.
Total	Total size of all obtained memory pools.
Date, Time	Date and time of the action.
Action	The action of Broker. The following actions are currently supported: Allocated: memory pool is allocated . Deallocated: memory pool is deallocated.

Maximum TCP/IP Connections per Communicator

This table shows the maximum number of TCP/IP connections per communicator: $\begin{tabular}{ll} \hline \end{tabular}$

Platform	Maximum Number of TCP/IP Connections per Communicator
AIX	2,048
BS2000/OSD	2,048
HP-UX	2,048
Linux	4,096
Solaris	65,356
Windows	4,096
z/OS	16,384
z/VSE	2,048

With the Broker-specific attribute POLL these restrictions can be lifted under z/OS and UNIX. See POLL.

See also MAX-CONNECTIONS under TCP-OBJECT (Struct INFO_TCP) under Information Reply Structures in the Broker CIS documentation.

Note for z/OS

Under z/OS, the following message may appear in the broker log:

```
ETBD0286 Diagnostic Values: accept: 124, EDC5124I Too many open files.errno2: 84607302 050B0146
```

The most common reason for this TCP/IP Communicator diagnostic message is the limitation of open files per user. The value of MAXFILEPROC in the BPXPRMOO parmlib member should be greater than the expected number of TCP/IP connections.

5 Broker Attributes

Name and Location of Attribute File	57
Attribute Syntax	57
Broker-specific Attributes	
Service-specific Attributes	84
■ Topic-specific Attributes	97
Codepage-specific Attributes	
Adabas SVC/Entire Net-Work-specific Attributes	
Security-specific Attributes	112
■ TCP/IP-specific Attributes	
c-tree-specific Attributes	
SSL-specific Attributes	
■ DIV-specific Attributes	
Adabas-specific Attributes	
■ Variable Definition File	

Note: This section lists all EntireX Broker parameters. Not all parameters are applicable to all supported operating systems.

The Broker attribute file contains a series of parameters (attributes) that control the availability and characteristics of clients and servers, publishers and subscribers as well as of the Broker itself. You can customize the Broker environment by modifying the attribute settings.

Name and Location of Attribute File

The name and location of the broker attribute file is platform-dependent.

Platform	File Name/Location
z/OS	Member <i>EXBATTR</i> in the EntireX Broker source library.

* When starting a broker manually, name and location of the broker attribute file can be overwritten with the environment variable *ETB_ATTR*.

Attribute Syntax

Each entry in the attribute file has the format:

ATTRIBUTE-NAME=value

The following rules and restrictions apply:

- A line can contain multiple entries separated by commas.
- Attribute names can be entered in mixed upper and lowercase.
- Spaces between attribute names, values and separators are ignored.
- Spaces in the attribute names are not allowed.
- Commas and equal signs are not allowed in value notations.
- Lines starting with an asterisk (*) are treated as comment lines. Within a line, characters following an * or # sign are also treated as comments.
- The CLASS keyword must be the first keyword in a service definition.
- Multiple services can be included in a single service definition section. The attribute settings will apply to all services defined in the section.
- Multiple topics can be included in a single topic definition section. The attribute settings will apply to all topics defined in the section.
- Attributes specified after the service definition (CLASS, SERVER, SERVICE keywords) overwrite the default characteristics for the service.
- Attributes specified after the topic definition (TOPIC *keyword*) override the default characteristics for the topic.
- Attribute values can contain variables of the form \${variable name} or \$variable name:

- Due to variations in EBCDIC codepages, braces should only be used on ASCII (UNIX or Windows) platforms or EBCDIC platforms using the IBM-1047 (US) codepage.
- The variable name can contain only alphanumeric characters and the underscore (_) character.
- The first non-alphanumeric or underscore character terminates the variable name.
- under UNIX and Windows, the string \${variable name} is replaced with the value of the corresponding environment variable.
- On z/OS, variable values are read from a file defined by the DD name ETBVARS. The syntax of this file is the same as the attribute file.
- If a variable has no value: if the variable name is enclosed in braces, error 00210594 is given, otherwise \$variable name will be used as the variable value.
- If you encounter problems with braces (and this is quite possible in a z/OS environment), we suggest you omit the braces.

Broker-specific Attributes

The broker-specific attribute section begins with the keyword DEFAULTS=BROKER. It contains attributes that apply to the broker. At startup time, the attributes are read and duplicate or missing values are treated as errors. When an error occurs, the broker stops execution until the problem is corrected.

Tip: To avoid resource shortages for your applications, be sure to specify sufficiently large values for the broker attributes that define the global resources.

			Operating System					
Attribute	Values	Opt/ Req	SO/z	XIND	Windows	zvse	BS2000	
ABEND-LOOP-DETECTION	YES NO	О	z	u	w	v	b	
	YES Stop broker if a task terminates abnormally twice, that is, the same abend reason at the same abend location already occurred. This attribute prevents an infinite abend loop. NO Use only if requested by Software AG Support. This setting may make sense if a known error leads to an abnormal termination, but a hotfix solving the problem has not yet been provided. Reset to "YES" when the hotfix has been installed.							
ABEND-MEMORY-DUMP	YES NO	О	Z	u	w	v	b	
	YES Print all data pools of the broker if a task terminates abnormation dump is needed to analyze the abend. NO If the dump has already been sent to Software AG, you can set to avoid the extra overhead.							
ACCOUNTING	<u>NO</u> 128-255	О	Z					
	NO YES [SEPARATOR=char]	0		u	W		b	
	Determines whether accounting records are created. NO Do not create accounting records.							
	nnn The SMF record number to use when writing the accounting YES Create accounting data. char=separator character(s). Up to seven separator character be specified using the SEPARATOR suboption, for example ACCOUNTING = (YES, SEPARATOR=;). If no separator character will be used.						ers can

Attribute	Values	Opt/ Req	SO/Z	NIIX	Windows	zvse	BS2000			
NUM-CMDLOG-FILTER	<u>1</u> n	0	Z	u	w	v	b			
	Maximum number of filters that can be specified simultaneously.									
	Tip: We recommend y	ou limit	this valu	e to the r	number o	f services	that are			
	being monitored. Min attribute CMDLOG is seinformation.									
NUM-COMBUF	1 - 999999	R	Z	u	W	v	b			
	Determines the maximum number of communication buffers available f processing commands arriving in the broker kernel. The size of one communication buffer is usually 16 KB split into 32 slots of 512 bytes, bu ultimately depends on the hardware architecture of your CPU. A value of (zero) is invalid.									
NUM-CONVERSATION or NUM-CONV	n AUTO	R	Z	u	W	v	b			
	number specified should be high enough to account for both conversational and non-conversational requests. (Non-conversational requests are treated internally as one-conversation requests.) **Number of conversations.* AUTO Uses the CONV-DEFAULT and the service-specific CONV-LIMIT values to calculate the number of conversations. The values used in the calculation must not be set to "UNLIM". Note:									
	 A value of 0 (zero) is invalid. If a wildcard service is defined in the service-specific section of the attribute file, the value of AUTO is invalid. See <i>Wildcard Service Definition</i>. 									
NUM-LONG-BUFFER or	n AUTO	R	z	u	w	v	ь			
NUM-LONG	Defines the number of long message containers. Long message containers have a fixed length of 4096 bytes and are used to store requests that are larger than 2048 bytes. Storing a request of 8192 bytes, for example, would require two long message containers. **Number of buffers.** AUTO Uses the LONG-BUFFER-DEFAULT and the service-specific LONG-BUFFER-LIMIT values to calculate the number of long.									

		Operating System							
Attribute	Values	Opt/ Req	SO/Z	XINO	Windows	zwse	BS2000		
	message buffers. The values used in the calculation must not be set to "UNLIM". A value of 0 (zero) is invalid. In non-conversational mode, message containers are released as soon as the client receives a reply from the server. If no reply is requested, message containers are released as soon as the server receives the client request. In conversational mode, the last message received is always kept until a new one is received. Note: 1. If a catch-all service is defined in the service-specific section of the attribute file, the value of AUTO is invalid.								
	2. See Wildcard Service Definition.								
NUM-PUBLICATION	n AUTO	О	Z	u	W	v	b		
	 Defines the number of publications that can be active concurrently. n Number of publications AUTO Uses the PUBLICATION-DEFAULT and the topic-specific PUBLICATION-LIMIT to calculate the number of publication values used in the calculation must not be set to "UNLIM" Note: 1. A value of 0 (zero) is invalid. 2. If a wildcard topic is defined in the topic-specific section of the at file, the value of AUTO is invalid. 								
NUM-PARTICIPANT-EXTENSION		O	Z	u	W	v	b		
Defines the number of participant extensions to link participants and servers. **Number of participant extensions** not specified If this attribute is not set, the default value is calculated on NUM-CLIENT and NUM-SERVER. A value of 0 (zero) is invalid.

	Switch on/off automatic update of topic defaults in the broker. YES The broker reads the attribute file whenever a topic is being subscribed for the first time. This allows broker to honor modifications in the attribute file without a restart. The attribute file is read only when the first subscriber subscribes to a particular topic. It is not reread when a second subscriber subscribes to the same topic.								
	NO The attribute file is read only once during broker startup. Any changes to the attribute file will be honored only if the broker is restarted.

Service-specific Attributes

Each section begins with the keyword <code>DEFAULTS=SERVICE</code>. Services with common attribute values can be grouped together. The attributes defined in the grouping apply to all services specified within it. However, if a different attribute value is defined immediately following the service definition, that new value applies. See also the sections <code>Wildcard Service Definition</code> and <code>Service Update Modes</code> below the table.

		Operating System							
Attribute	Values	Opt/ Req	SO/z	XINO	Windows	zwse	BS2000		
CLASS	A32 (case-sensitive)	R	z	u	W	v	b		
	Part of the name SERVER and SE followed immed	RVICE a	ttributes	.CLASS	must be	specifie			
	Classes starting with any of the following are reserved for use by Software AG and should not be used in customer-written applications: BROKER, SAG, ENTIRE, ETB, RPC, ADABAS, NATURAL. Valid characters for class name are letters a-z, A-Z, numbers 0-9, hyphen and underscore. Do not use dollar, percent period or comma. See also the restriction for SERVICE attribute names.								
CLIENT-RPC-AUTHORIZATION	<u>N</u> Y	О	Z				b		
	Determines whether this service is subject to RPC authorization checking. N No RPC authorization checking is performed. Y RPC library and program name are appended to the authorization check performed by EntireX Security. Specify "YES" only to RPC-supported services. To allow conformity with Natural Security, the CLIENT-RPC-AUTHORIZATION parameter can optionally be defined with a prefix character as follows: CLIENT-RPC-AUTHORIZATION= (YES, <pre>prefix-character>)</pre>

Wildcard Service Definition

The special names of CLASS = *, SERVER = * and SERVICE = * are allowed in the service-specific section of the broker attribute file. These are known as "wildcard" service definitions. If this name is present in the attribute file, any service that registers with the broker and does not have its own entry in the attribute file will inherit the attributes that apply to the first wildcard service definition found.

For example, a server that registers with CLASS=ACLASS, SERVER=ASERVER and SERVICE=ASERVICE can inherit attributes from any of the following entries in the attribute file (this list is not necessarily complete):

```
CLASS = *, SERVER = ASERVER, SERVICE = ASERVICE
CLASS = ACLASS, SERVER = *, SERVICE = *
CLASS = *, SERVER = *, SERVICE = *
```

Of course, if there is a set of attributes that are specifically defined for CLASS=ACLASS, SERVER=ASERV-ER, SERVICE=ASERVICE, then all of the wildcard service definitions will be ignored in favor of the exact matching definition.

Service Update Modes

EntireX has two modes for handling service-specific attributes. See broker-specific attribute SER-VICE-UPDATES.

- In **service update mode** (SERVICE-UPDATES=YES), the service configuration sections of the attribute file are read whenever the first replica of a particular service registers.
- In **non-update mode** (SERVICE-UPDATES=NO), the attribute file is not reread. All attributes are read during startup and the broker does not honor any changes in the attribute file. This mode is useful if
 - there is a high frequency of REGISTER operations, or
 - the attribute file is rather large and results in a high I/O rate for the broker.

The disadvantage to using non-update mode is that if specific attributes are modified, the broker must be restarted to effect the changes. Generally, this mode should be used only if the I/O rate of the broker is considerably high, and if the environment seldom changes.

OPTION Values for Conversion

The different option values allow you to either handle character conversion deficiencies as errors, or to ignore them:

- 1. Do not ignore any character conversion errors and force an error always (value STOP). This is the default behavior.
- 2. Ignore if characters can not be converted into the receiver's codepage, but force an error if sender characters do not match the sender's codepage (value SUBSTITUTE-NONCONV).
- 3. Ignore any character conversion errors (values SUBSTITUTE and BLANKOUT).

The situations 1 and 2 above are reported to the broker log file if TRACE option for CONVERSION is set to level 1.

		Options Supported for		if TRACE	in Broker Log File Option for ON is set to 1
Value	Description	SAGTCHA	SAGTRPC	Bad Input Characters (Sender's Codepage)	Non-convertible Characters (Receiver's Codepage)
SUBSTITUTE	Substitutes both non-convertible characters (receiver's codepage) and bad input characters (sender's codepage) with a	yes	yes	No message.	No message

				Report Situation	in Broker Log File
		Options Su	pported for		Option for
Value	Description			Bad Input Characters (Sender's Codepage)	Non-convertible Characters (Receiver's Codepage)
	codepage-dependent default replacement character.				
SUBSTITUTE-NONCONV	If a corresponding code point is not available in the receiver's codepage, the character cannot be converted and is substituted with a codepage-dependent default replacement character. Bad input characters in sender's codepage are not substituted and result in an error.	yes	yes	Write detailed conversion error message.	No message.
BLANKOUT	Substitutes non-convertible characters with a codepage-dependent default replacement; blanks out the complete RPC IDL field containing one or more bad input characters.	no	yes	No message.	No message.
STOP	Signals an error on detecting a non-convertible or bad input character. This is the default behavior if no option is specified.	yes	yes	conversion	Write detailed conversion error message.

Topic-specific Attributes

The topic-specific attribute section begins with the keyword <code>DEFAULTS=TOPIC</code> as shown in the sample attribute file. It contains attributes that apply to the publish and subscribe communication model.

	Operating System								
Attribute	Values	Opt/ Req	SO/z	XINO	Windows	zvse	BS2000		
ALLOW-DURABLE	YES NO	0	z	u	w	v	b		
	Determines who subscription to YES Subscriber NO Durable so	a topic. r may pe	rform dı	urable su	-		durable		
	If users are allowed to durably subscribe to any topic, you must specify a value for the SUBSCRIBER-STORE parameter.								
ALLOW-USER-SUBSCRIBE	YES NO O z u w v b								
	Determines if it is possible for a user to subscribe to a topic directly (YES) or only by Administrator. YES Users are allowed to subscribe to the topic. NO Users must be subscribed by the Administrator through CIS. See <i>Broker Command and Information Services</i> . The subscribe request of users is rejected.								
AUTO-COMMIT-FOR-SUBSCRIBER	NO YES	О	Z	u	W	V	b		
	NO No COMMIT performed. YES An implicit COMMIT is performed by broker when the subscriber receives a publication, that is, the subscriber does not need the CONTROL_PUBLICATION option COMMIT after receiving each publication. Caution: You may lose your last message.

	In the case of a non-durable subscriber, the user's subscription is also cancelled. In the case of a durable subscriber, the user's subscription is persisted, and it is not necessary for the user to issue any subsequent SUBSCRIBE commands. The subscription of a durable subscriber is also persisted even while broker is stopped. If not specified, defaults to 5 minutes. This is the time after which the subscriber's internal memory structures will be cleaned up and a subsequent logon is required.									
SUBSCRIPTION-EXPIRATION	$\begin{array}{c ccccccccccccccccccccccccccccccccccc$									
	Subscriptions are retained by broker until either the user issues an UNSUBSCRIBE command or the subscription lifetime has expired. NEVER Subscriber will never be purged from PSTORE. n Same as nS. nS Expiration time in seconds (max. 2147483647). nM Expiration time in minutes (max. 35791394). nH Expiration time in hours (max. 596523). nD Expiration time in days (max. 24855).									
	Durable subscriptions remain effective even if the user performs the LOGOFF command or broker is stopped. The subscription lifetime is calculated also for periods of time when broker is stopped. SUBSCRIPTION-EXPIRATION is the time after which the subscription expires. In the case of durable subscription, the subscription is removed from the PSTORE. Broker removes expired subscriptions only when the user is not currently active, for example

Codepage-specific Attributes

The codepage-specific attribute section begins with the keyword <code>DEFAULTS=CODEPAGE</code> as shown in the sample attribute file. You can use the attributes in this section to customize the broker's locale string defaults and customize the mapping of locale strings to codepages for the internationalization approaches ICU conversion and SAGTRPC user exit. These attributes do not apply to other approaches. See <code>Internationalization with EntireX</code> for more information.

				Op	perating System	em				
Attribute	Values	Opt/ Req	SO/Z	XINU	Windows	zwse	BS2000			
DEFAULT_ASCII	Any ICU converter name or alias. See also Additional Notes below.	O	Z	u	W	V	b			
	Customize the broker's locale string defaults by assigning the default codepage for EntireX components (client or server, publisher or subscriber). See <i>Broker's Locale String Defaults</i> under <i>Locale String Mapping</i> in the internationalization documentation. This value is used instead of the broker's locale string defaults if the calling component does not send a locale string itself, and the calling component is running on an ASCII platform (UNIX, Windows, etc.), and one of the internationalization approaches ICU conversion or SAGTRPC user exit is used. See <i>ICU Conversion</i> under <i>Introduction to Internationalization</i> and <i>SAGTRPC User Exit under Introduction to Internationalization</i>									
	Example: DEFAULTS=CODEPAGE /* Broker Locale String Defaults */ DEFAULT_ASCII=windows-950 For more examples, see Configuring Broker's Locale String Defaults under Locale String Mapping in the internationalization documentation and also Additional Notes below.									
DEFAULT_EBCDIC_IBM	Any ICU converter	0	z	u	W	V	b

			Operating System						
Attribute	Values	Opt/ Req	SO/Z	XNU	Windows	zwse	BS2000		
		r more examples, see <i>Bypassing Broker's Built-in Locale String Mapping</i> under cale String Mapping in the internationalization documentation and also <i>Additionalities</i> below.							

Additional Notes

- Locale string matching is case insensitive when bypassing the broker's built-in mechanism, that is, when the broker examines the codepages section in the attribute file.
- If ICU is used for the internationalization approach and if the style in not known by ICU, e.g. ECSnnnn, <ll>_<cc> etc., the name will be mapped to a suitable ICU alias. For more details on the mapping mechanism, see Broker's Built-in Locale String Mapping under Locale String Mapping in the internationalization documentation. For more details on ICU and ICU converter name standards, see ICU Resources under Introduction to Internationalization.
- If SAGTRPC user exit is used for the internationalization approach, we recommend assigning the codepage in the form CP<nnnnn>. To determine the number given to SAGTRPC user exit, see *Broker's Built-in Locale String Mapping* under *Locale String Mapping* in the internationalization documentation.
- See CONVERSION and CONVERSION attribute CONVERSION on this page for the internationalization approach in use.

Adabas SVC/Entire Net-Work-specific Attributes

The Adabas SVC/Entire Net-Work-specific attribute section begins with the keyword <code>DEFAULTS=NET</code> as shown in the sample attribute file. The attributes in this section are needed to execute the Adabas SVC/Entire Net-Work communicator of the EntireX Broker kernel.

Note: This section applies to mainframe platforms only. It does not apply to UNIX and Windows.

TCP/IP-specific Attributes

The TCP/IP-specific attribute section begins with the keyword <code>DEFAULTS=TCP</code> as shown in the sample attribute file. It contains attributes that apply to the TCP/IP transport communicator. The transport is activated by <code>TRANSPORT=TCP</code> in the Broker-specific section of the attribute file. A maximum of five TCP/IP communicators can be activated by <code>specifying</code> up to five <code>HOST/PORT</code> pairs.

			Operating System							
Attribute	Values	Opt/ Req	SO/Z	XNO	Windows	zwse	BS2000			
CONNECTION-NONACT	n nS nM nH	0	z	u	w	v	b			
	Non-activity of the TCP/IP connection, after which a close is performed and the connection resources are freed. If this parameter is not specified here, broker will close the connection only when the application (or the network itself) terminates the connection. **Non-activity* time in seconds (min. 600, max. 2147483647). **MM* Non-activity* time in minutes (min. 10, max. 35791394). **MH* Non-activity* time in hours (max. 596523). If not specified, the connection non-activity test is disabled. On the stub side, non-activity can be set with the environment variable ETB_NONACT. See **Limiting the TCP/IP Connection Lifetime** in the platform-specific **Stub Administration** sections of the EntireX documentation.									
HOST	0.0.0.0 HostName IP address The address requests. If HOST is no system (or standard system) A maximum of broker's T	ot specified, tack). a of five HOS	broker will T/PORT pain	listen on an	ıy attached i	nterface ad	apter of the

SSL-specific Attributes

The SSL-specific attribute section begins with the keyword <code>DEFAULTS=SSL</code> as shown in the sample attribute file. The attributes in this section are needed to execute the SSL communicator of the EntireX Broker kernel. In this section, "SSL" also applies to TLS (Transport Layer Security).

				Оре	erating Sys	tem			
Attribute	Values	Opt/ Req	SO/Z	XINO	Windows	z/vSE	BS2000		
CIPHER-SUITE	string	0	z	u	w		b		
	String that is passed to the underlying SSL implementation. SSL is a standardice protocol that uses different cryptographic functions (hash functions, symmet and asymmetric encryption etc.). Some of these must be implemented in the SSL stack; others are optional. When an SSL connection is created, both paragree by "handshake" on the <i>cipher suite</i> , that is, the algorithms and key lengused. In a default scenario, this information depends on what both sides are capable of. It can be influenced by setting the attribute CIPHER-SUITE for SSL server side (the broker always implements the server side). The stubs control to the broker and thereby become the SSL clients. Under UNIX and Windows, the OpenSSL implentation of the SSL server side is used; on z/OS and BS2000/OSD it is GSK. Example for OpenSSL:								
	CIPHER-SUITE=RC4-	MD5				:h standar 95 as hash			
	CIPHER-SUITE=EXP-	EDH-DSS	-DES-CB(C-SHA Ex	treme exa	mple.			
	Example for GSK:								
	CIPHER-SUITE=090306 Use DES and SHA1 with export key lengths, or RC4 and MD5 with export key lengths, or RC2 and MD5 with export key lengths.								
	For more information see:								
	OpenSSL http://www.openssl	.org/docs/	apps/cipl	ners.html

DIV-specific Attributes

The DIV-specific attribute section begins with the keyword DEFAULTS = DIV. The attributes in this section are required if PSTORE-TYPE = DIV is specified.

			Operating System							
Attribute	Values	Opt/ Req	SO/Z	XN∩	Windows	zwse	BS2000			
DIV	A511	R	Z							

The VSAM Persistent Store parameters, enclosed in double quotes (""). The value can span more than one line. See *Format Parameters* under *Managing the Broker Persistent Store* in the z/OS administration documentation for details of the parameters. In previous versions of EntireX, these parameters were read from the SYSIN DD during broker kernel startup.

Adabas-specific Attributes

The Adabas-specific attribute section begins with the keyword <code>DEFAULTS = ADABAS</code>. The attributes in this section are required if <code>PSTORE-TYPE = ADABAS</code> is specified. In previous versions of EntireX, these Adabas-specific attributes and values were specified in the broker-specific <code>PSTORE-TYPE</code> attribute.

				0	Operating System						
Attribute	Values	Opt/ Req	SO/Z	XNU	Windows	zWSE	BS2000				
BLKSIZE	126-20000	О	z	u w		V	b				
	Optional blocking factor used for message data. If not specified, broker will split the message data into 2 KB blocks to be stored in Adabas records. The maximum value depends on the physical device assigned to data storage. See the <i>Adabas</i> documentation. For reasons of efficiency, do not specify a BLKSIZE much larger than the actual total size of the UOW data to be written. The total UOW size is the sum of all messages in the UOW plus 41 bytes of header information. This takes effect only after COLD start. The BLKSIZE parameter applies only for a cold start of broker; subsequently the value of BLKSIZE is taken from the last cold start. Default value is 2000.										
DBID	1 - 32535	1 - 32535 R z u w v b									

			Operating System									
Attribute	Values	Opt/ Req	SO/Z	XINU	Windows	zNSE	BS2000					
	Database ID of Adabas database where the persistent store resides.											
FNR	1 - 32535	R	Z	u	w	v	b					
	File number of broker persistent store file.											
FORCE-COLD	<u>N</u> Y	О	Z	u	W	v	b					
	Determines whether a broker cold start is permitted to overwrite a persistent store file that has been used by another broker ID and/or platform. Specify Y to allow existing information to be overwritten.											
MAXSCAN	0- <i>n</i>	O	Z	u	W	v	b					
	Limits display of persistent UOW information in the persistent store through Command and Information Services. Default value is 1000.											
OPENRQ	<u>N</u> Y	О	z	u	W	V	b					
	Determines whether driver for Adabas persistent store is to issue an OPEN command to Adabas.											
SVC	200-255	R	Z			V						
	Use this parameter to specify the Adabas SVC number to be used by the Adabas persistent store driver.											
TRACE-LEVEL	0-8	О	z	u	W	V	b					
	Trace level for Adabas persistent store. It overrides the global value of trace level in the attribute file.											

Variable Definition File

The broker attribute file contains the configuration of one EntireX Broker instance. In order to share attribute files between different brokers, you identify the attributes that are unique and move them to a variable definition file. This file enables you to share one attribute file among different brokers. Each broker in such a scenario requires its own variable definition file.

The following attributes are considered unique for each machine:

- BROKER-ID (in Broker-specific attributeBROKER-ID)
- NODE (in Entire Net-Work-specific attribute NODE)
- PORT (in PORT (SSL) and PORT (TCP/IP))

How you use the variable definition file will depend upon your particular needs. For instance, some optional attributes may require uniqueness - for example, DBID and FNR in DEFAULTS=ADABAS - so that you may specify the persistent store.

6 Administration of Broker Stubs under z/OS

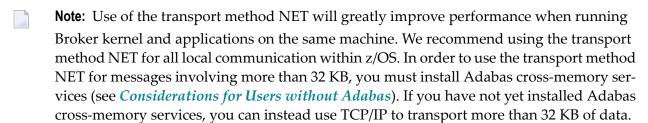

Available Stubs	134

Support of Clustering in a High Availability Scenario	
Considerations for Users without Adabas	

Available Stubs

This table lists all broker stubs available under z/OS are to be used with the programming languages Assembler |C| COBOL | Natural | PL/I.

Your selection of a specific broker stub depends on the following:

- the environment (TP monitor, TSO, Batch, Natural)
- the transport method (NET, TCP, or SSL)
- the availability of administration features such as trace, and of function features such as compression

Note for Adabas 8.1 users

When using Adabas 8.1.1 with any of the z/OS stubs to transport more than 32 KB of data, note the following:

- Adabas/WAL 8.1 ADASVC must be installed.
- The Adabas/WAL 8.1 link routine must be used by the application or TP monitor.
- Adabas/WAL 8.1 libraries must be used by the broker kernel.
- Adabas/WAL 8.1 libraries must be used by the broker stubs.
- The parameter EXTENDED-ACB-SUPPORT must be used for transmitting data from Adabas SVC (NET).
- Sufficient buffer space by IUBL, NABS and NUM-COMBUF must be specified.

BROKER

Scope

See *Available Stubs* above for overview of functionality and considerations.

Prerequisites and Installation Notes

This stub can be used in a multithreading (subtasking) environment, provided ADAUSER is not linked to the application.

Notes:

- 1. It is recommended to load BROKER dynamically within the application program and not to link BROKER with any Adabas link routine. BROKER will attempt to load ADALNKR dynamically.
- 2. However, if BROKER has to be statically linked, see the subsection *Linkage* below.
- 3. BROKER is the recommended stub for any batch environment. It provides all available stub features.

Linkage

Choose the method most appropriate for your application:

- Method 1: Reentrant (Thread-Safe)
- Method 2: Non-reentrant

Method 1: Reentrant (Thread-Safe)

Link your application to module BROKER from the EntireX load library (EXX951.LOAD).

Linkage statements:

```
INCLUDE userlib(mainpgm) Main Program
INCLUDE exxlib(BROKER) Broker stub
ENTRY mainpgm
NAME ...
```

The SVC number may be specified as part of the Broker ID, for example:

```
ETB220:SVC237:NET
```

Method 2: Non-reentrant

Link your application to module BROKER from the EntireX load library (EXX951.LOAD) and the module ADAUSER from the Adabas load library.

Linkage statements:

```
INCLUDE userlib(mainpgm) Main Program
INCLUDE exxlib(BROKER) Broker stub
INCLUDE wallib(ADAUSER) Adabas batch/TSO front end
ENTRY mainpgm
NAME ...
```

Notes:

Linking with ADAUSER provides the ability to specify the required SVC in the Adabas DDCARD parameter of the application job, as shown below:

```
//J020S1 EXEC PGM=PROGRAM

//STEPLIB DD DISP=SHR,DSN=EXX951.L0AD

// DD DISP=SHR,DSN=WAL825.L0AD

//ETBPRINT DD SYSOUT=*

//SYSUDUMP DD SYSOUT=*

//DDCARD DD *

ADARUN MODE=MULTI,PROGRAM=USER,SVC=237

/*
```

When linking the stub for use in IMS (BMP), please substitute the appropriate Adabas link module for this environment.

Whichever linkage method you select, you *must* ensure that library EXX951.LOAD is in the steplib of the application and that library WAL825.LOAD is in the steplib when using Adabas [NET] transport.

When using any of the batch stubs, you must ensure the Adabas link routine (ADALNK/ADALNKR) does not contain any exits which assume the length of the Adabas data area UB is extended beyond its default value. Contact Software AG support if you are unsure about this.

CICSETB

Scope

See *Available Stubs* above for overview of functionality and considerations.

Prerequisites and Installation Notes

- EntireX z/OS CICS® RPC Server uses CICSETB as default.
- It is recommended to load CICSETB dynamically within the application program.
- CICSETB will attempt to load ADACICS dynamically, using EXEC CICS LINK PROGRAM.
- CICSETB is the recommended stub for any CICS environment.
- CICSETB must be available in the CICS RPL search chain if called dynamically. Alter the CICS procedure or job, adding the EXX load library to both the STEPLIB and DFHRPL library concatenations.
- See the CICS-related entries for EXAGLUE, EXAMEM and CICSETB2 in job EXXCICS in the EXX jobs library.
- CICSETB can be used with or without a CICS TWA (transaction work area).
 - With TWA

At least 24 bytes of transaction work area must be defined in your CICS transaction if you choose to specify a TWA.

■ Without TWA

Prerequisite is building an Adabas CICS interface, specifying PARMTYP=ALL for either the ADAGSET or LGBLSET MACRO (depending upon the Adabas version). There are no application changes required for using CICSETB without TWA.

Note: When using Adabas 8.1, in order to transport more than 32 KB of data, PARM-TYP=ALL is required.

■ If the name of your Adabas CICS link routine is different from "ADACICS", please use zap EXX951.ZAPS(EXX0007) to set the site-specific name of your Adabas CICS link routine. The zap will change the name to "ADABAS".

Linkage

Link your application to member CICSETB from the EntireX load library (EXX951.LOAD).

Linkage statements for COBOL applications:

```
INCLUDE cicslib(DFHECI) CICS Prolog Module
INCLUDE userlib(mainpgm) Main Program
INCLUDE cicslib(DFHELII) CICS Module
INCLUDE exxlib(CICSETB) Broker stub
ENTRY mainpgm
NAME ...
```

Linkage statements for Assembler applications:

```
INCLUDE cicslib(DFHEAI) CICS Prolog Module
INCLUDE userlib(mainpgm) Main Program
INCLUDE cicslib(DFHEAIO) CICS Module
INCLUDE exxlib(CICSETB) Broker stub
ENTRY mainpgm
NAME ...
```

COMETB

Scope

See *Available Stubs* above for overview of functionality and considerations.

Prerequisites and Installation Notes

- We recommend you load COMETB dynamically within the application program. COMETB is a non-reentrant member.
- COMETB is the stub for any Com-plete environment.
- COMETB must be available in the COMPLIB search chain if called dynamically. Modify the Com-plete procedure or job, adding the EXX load library to the COMPLIB library concatenations.
- COMETB requires about 950 KB storage above the line. Increase the Com-plete SYSPARM THSIZEABOVE by 950 KB.
- COMETB requires about 16 KB storage below the line. If the EXAENV data set is used and the BLKSIZE is greater than 6 KB, add the difference between 6 KB and the effective BLKSIZE to the recommended 16 KB. Increase the ULIB region size for your application that calls COMETB by this value.

Linkage

Link your application to member COMETB from the EntireX load library (EXX951.LOAD).

Simulating Environment Variables

Under Com-plete, a partitioned data set is used to store environment variables. The SAGTOKEN utility is not used here. See *EXAENV Environment Store*.

EXAENV Environment Store

Environment variables for the COMETB stub are handled by an easy-to-use approach that is compliant with Com-plete.

A partitioned data set is assigned by DD EXAENV. It represents the environment store for all Complete users. The member name is the name of the user logged on to Com-plete. If you want to define your own stub environment variables, add a text member with your user name and put all environment variables into it.

The environment store has following data set characteristics:

DSORG=PO LRECL=80 RECFM=FB

A line in the text member setting the environment variable looks like:

ETB_STUBLOG=1

Variable name and variable value are left-justified and delimited by an equals sign. The first blank in the line identifies the end of the environment value definition.

The following keywords are currently supported:

- ETB NONACT
- ETB_STUBLOG
- ETB_TIMEOUT

See *Environment Variables in EntireX* in the general administration documentation.

Note: The destination of the stublog (environment variable ETB_STUBLOG) is controlled by the hardcopy setting in Com-plete. See hardcopy function from the UUTIL menu. If no device name has been defined, the stublog is displayed on the terminal. If HC has been specified, the stublog will be written to the Com-plete spool and routed to the device name supplied using HC=name.

IDMSETB

Scope

See *Available Stubs* above for overview of functionality and considerations.

Prerequisites and Installation Notes

None.

Linkage

Link your application to member IDMSETB from the EntireX load library (EXX951.LOAD).

Note: IDMSETB cannot be called dynamically.

MPPETB

Scope

See Available Stubs above for overview of functionality and considerations.

Prerequisites and Installation Notes

■ None.

Linkage

Link your application to member MPPETB from the EntireX load library (EXX951.LOAD) and the appropriate Adabas link module from the Adabas load library.

Note: MPPETB can be called dynamically, but the appropriate ADALNK (ADALNI) must be linked to MPPTB beforehand.

NATETB23

Scope

See *Available Stubs* above for overview of functionality and considerations.

Prerequisites and Installation Notes

- Set the Natural size parameters so that Natural can provide the stub with 34 KB at runtime.
- To use send/receive buffers of greater than 32 KB with NATETB23, WAL81 or above must be installed.

Prerequisites and Installation Notes for Natural

- Set the Natural sizes parameters so that Natural can provide the stub with 34 KB at runtime.
- Send/receive buffers of greater than 32 KB can be used with NATETB23 provided that WAL811 is installed.

Linkage

- To statically link the stub for use in z/OS Batch, TSO, CICS, IMS(BMP), IMS(MPP) and Complete, link NATETB23 into the load library where the shared Natural nucleus resides. NATETB23 is a reentrant and relocatable module.
- Alternatively, the NATETB23 stub can be dynamically invoked by the following Natural parameters:

RCA=BROKER, RCALIAS=(BROKER, NATETB23)

Linkage under Natural

- Linking the stub for use in z/OS Batch, TSO, CICS, IMS(BMP), IMS(MPP) and Com-plete:
 - Link NATETB23 in the Load Library to the shared part of the Natural nucleus. NATETB23 is a reentrant and relocatable module.
- To verify the installation, see *Installation Verification under Natural*.

Installation Verification under Natural

To verify the installation of the stub under Natural

- 1 Log on to Natural library SYSRPC and type MENU.
- 2 Invoke SM Service Directory Maintenance from the main menu.
- 3 Define the Node and Server and save.
- 4 Invoke XC Server Command Execution from the main menu for the node and server defined in the previous step.
- 5 Ping the server with the command PI.

Your environment and the stub are installed correctly if you receive

- 02150148 Connection error, meaning that the broker and the RPC server are down;
- 00070007 Service not registered, meaning that the broker is up and the RPC server is down;
- an answer from the RPC server.

For other return codes, see *Error Messages and Codes*.

Setting Transport Methods for Broker Stubs

- Transport Method Values
- Default Transport Methods
- Setting the Timeout for the Transport Method
- Limiting the TCP/IP Connection Lifetime

Transport Method Values

The following table describes the possible values for the transport methods:

Transport Value	Description / Tips
NET	Use Adabas Cross-Memory Services as transport method. See <i>Installing Adabas Components for EntireX under z/OS</i> in the z/OS installation documentation. It is also possible to communicate remotely with the transport method NET from an application (client or server) to the broker kernel using Entire Net-Work. For remote NET communication, Entire Net-Work must be installed both on the machine where the broker kernel runs and on the machine where your application (client or server) runs, and a connection must be established.
	Using Adabas/WAL V811 allows more than 32 KB of data to be communicated. Otherwise the following maximum values are allowed:
	ACI Version Max Send/Receive length

Transport Va	Description / Tips	
	1	32167
	2, 3	31647
	4-8	31643
	9 or above	31123
	Note: If Adabas version 8 is <i>not</i> us	ed, these same limits still apply under z/OS.
TCP	Use TCP/IP as transport method.	
SSL	Use Secure Sockets Layer (SSL) as	ransport method.

Default Transport Methods

Stub	Default Transport Method
BROKER	NET
CICSETB	NET
COMETB	NET
IDMSETB	TCP
MPPETB	NET
NATETB23	NET

Setting the Timeout for the Transport Method

Introduction

If the transport layer is interrupted, communication between the Broker and the stub - that is, client or server application - is no longer possible. A client or server might possibly wait infinitely for a Broker reply or message in such a situation. To prevent this and return control to your calling application in such a situation, set a timeout value for the transport method.

The timeout settings for transport layers are independent of the timeout settings of the broker.

Setting the timeout for the transport layer is possible for the transport methods TCP and SSL and is supported by all broker stubs under z/OS.

Notes:

- 1. Does not apply to stubs with transport method NET.
- 2. See Setting a Transport Timeout with the SAGTOKEN Utility below for more information.

Transport Timeout Values

The timeout value for the transport method is used together with the Broker timeout - which is set by the application in the WAIT field of the Broker ACI control block - to calculate the actual value for the transport layer's timeout:

The following table describes the possible values for the transport timeout when supported by the stub used.

Transport Timeout Value	Description
0	Infinite wait for the application.
1	The transport method additionally waits this time in seconds. A negative value is treated as TIMEOUT=0 (infinite wait for the application).
nothing set	Transport method waits additional 20 seconds.

The actual timeout for transport layer equals Broker timeout (WAIT field) + timeout value for transport method.

Setting a Transport Timeout with the SAGTOKEN Utility

► To set a transport timeout with the SAGTOKEN utility

As a prerequisite, the steplib EXX951.LOAD of SAGTOKEN needs to be APF-authorized. For information on operand2, see the SAGTOKEN utility. For information on value, see the *Transport Timeout Values*.

■ Use the SAGTOKEN utility with the following syntax:

```
//STEP EXEC PGM=SAGTOKEN,PARM=('SET LOCAL,TIMEOUT=value')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

Usage Example

```
//STEP EXEC PGM=SAGTOKEN,PARM=('SET LOCAL,TIMEOUT=20')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

Limiting the TCP/IP Connection Lifetime

With transport methods TCP/IP and SSL, the broker stub establishes one or more TCP/IP connections to the brokers specified with BROKER-ID. These connections can be controlled by the transport-specific CONNECTION-NONACT attribute on the broker side, but also by the transport-specific environment variable ETB_NONACT on the stub side. If ETB_NONACT is not 0, it defines the non-activity time (in seconds) of active TCP/IP connections to any broker. See ETB_NONACT. Whenever the broker stub is called, it checks for the elapsed non-activity time and will close connections with a non-activity time greater than the value defined with ETB_NONACT.

Transport Non-activity Value	Description
0	Infinite lifetime until application is stopped.
n (seconds)	Transport connections with non-activity time greater than n will be closed.
Nothing set	Transport connections with non-activity time greater than 300s (default) will be closed.

Tracing for Broker Stubs

Scope

Setting tracing is supported by the broker stubs BROKER and CICSETB.

Load the appropriate stub or link your application with it from the EntireX load library (EXX951.LOAD). All stubs provide entry point BROKER.

The following table describes the possible values for the broker stub trace:

Trace	Level	Description
0	NONE	No tracing. Switch tracing off.
1	STANDARD	Traces initialization, errors, and all ACI request/reply strings.
2		Used primarily by system engineers, traces everything from level 1 and provides additional information, for example the Broker ACI control block, as well as information from the transports.
3	SUPPORT	This is full tracing through the stub, including detailed traces of control blocks, message information, etc.

The trace level is set by assigning DDNAMEs EXALOG1, EXALOG2 or EXALOG3. The following DD statement instructs the stub to turn on tracing with level 3:

//EXALOG3 DD DUMMY

The DD statements represent a more efficient way of setting the trace level than the SAGTOKEN utility. However, the SAGTOKEN utility is still available. See *Setting Tracing with the SAGTOKEN Utility* below.

Trace Output Location

The location of the trace output file depends on the stub and the transport used:

Stub	Transport	DDNAME	Note
BROKER	SSL and TCP	DD:TRACE1	
		DD:EXALOG1, DD:EXALOG2 or DD:EXALOG3	A real file assignment is required if the trace output is desired for transport NET.
CICSETB	all	DD:MSGUSR	

Examples

To set trace level 2 for stub BROKER with SSL or TCP transport:

```
//TRACE1 DD SYSOUT=*
//EXALOG2 DD DUMMY
```

To set trace level 3 for stub BROKER with NET transport:

```
//EXALOG3 DD SYSOUT=*
```

To set trace level 1 for stub BROKER with all transports:

```
//TRACE1 DD SYSOUT=*
//EXALOG1 DD SYSOUT=*
```

Setting Tracing with the SAGTOKEN Utility

Use the SAGTOKEN utility with the following syntax:

To switch on tracing

As a prerequisite, the steplib EXX951.LOAD of SAGTOKEN needs to be APF-authorized.

■ The option to set trace is set with the SAGTOKEN utility using the following syntax:

```
//STEP EXEC PGM=SAGTOKEN,PARM=('SET LOCAL,STUBLOG=value')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

Example:

```
//STEP EXEC PGM=SAGTOKEN,PARM=('SET LOCAL,STUBLOG=1')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

To switch off tracing

■ Use the SAGTOKEN utility to set STUBLOG to zero.

```
//STEP EXEC PGM=SAGTOKEN,PARM=('SET LOCAL,STUBLOG=0')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

Or:

Use the SAGTOKEN utility to delete STUBLOG

```
//STEP EXEC PGM=SAGTOKEN,PARM=('DELETE LOCAL,STUBLOG')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

SVC Number for Broker Communication

Stub	Notes
BROKER	When Entire Net-Work transport is used, the default SVC number (249) can be overridden in the following ways:
	■ By specifying the SVC number as part of the Broker ID, for example:
	ETB220:SVC237:NET
	■ By including ADAUSER when linking the stub with the application. This enables the SVC number to be specified in the ADARUN cards of the application job. This option cannot be employed if the application operates within a multithreading application (multiple TCBs).
	■ By using the supplied zap if neither of the above options is chosen. See <i>BROKER</i> under <i>Administration of Broker Stubs under z/OS</i> .
CICSETB	When Entire Net-Work transport is used and the default SVC number (249) has to be changed, the Adabas communications module under CICS determines how the SVC number can be changed. See the Adabas documentation for information on how to change the SVC number.
COMETB	■ The Adabas interface is integrated within the TP Monitor Com-plete.

SAGTOKEN Utility

SAGTOKEN allows you to set variables. When setting variables with SAGTOKEN, SAGTOKEN error messages may be displayed on the operator console. The steplib EXX951.LOAD of SAGTOKEN must be APF-authorized. See *EntireX SAGTOKEN Messages* under *Error Messages and Codes*.

Syntax

```
//STEP EXEC PGM=SAGTOKEN,PARM=('operand1 operand2,operand3=value')
//STEPLIB DD DISP=SHR,DSN=EXX951.LOAD
```

Operands

operand1 is one of the following commands:

Command	Use
SET	Set or replace a SAGTOKEN variable.
DELETE	Delete a SAGTOKEN variable.
DISPLAY	Display a SAGTOKEN variable.

operand2 is either LOCAL or GLOBAL:

Value	Meaning
LOCAL	Applies to the address space.
GLOBAL	Applies to the z/OS image.

operand3 is the name of the variable to set:

Variable	Value
	For information on STUBLOG value, see <i>Tracing for Broker Stubs</i> under <i>Administration of Broker Stubs under z/OS</i> in the z/OS administration documentation.
TIMEOUT	For information on TIMEOUT value, see <i>Setting the Timeout for the Transport Method</i> under <i>Administration of Broker Stubs under z/OS</i> in the z/OS administration documentation.
TRANSPORT	For information on setting the transport mechanism, see ETB_TRANSPORT.

Note: If a job uses SAGTOKEN to set local tokens in one step, we recommend that you delete these tokens prior to job termination in order to release all acquired resources.

Support of Clustering in a High Availability Scenario

EntireX Broker supports clustering in a high-availability scenario, using the environment variable ETB_SOCKETPOOL. See *Environment Variables in EntireX* in the general administration documentation. This section covers the following topics:

- Introduction
- Exceptions
- Default

Restriction

See also High Availability in EntireX.

Introduction

A TCP/IP connection established between stub and broker is not exclusively assigned to a particular thread. With multithreaded applications, two or more threads may use the same connection. On the other hand, if a connection is busy, another new one is created to exchange data.

In order to access the same broker instance in a clustering environment, an affinity between application thread and TCP/IP connection is needed to always use the same connection within an application thread. Therefore, an environment variable is evaluated to control the handling of TCP/IP connections.

If environment variable ETB_SOCKETPOOL is set to "OFF" (ETB_SOCKETPOOL=OFF), an affinity between threads and TCP/IP connections is established. All requests to one particular broker will use the same TCP/IP connection. ETB_SOCKETPOOL controls all TCP/IP connections.

Exceptions

Broker attribute CONNECTION-NONACT is used by the broker to close TCP/IP connections after the elapsed non-activity time. Omit this attribute to keep the TCP/IP connection alive.

Default

ETB_SOCKETPOOL=ON is the default setting. In this case, an established broker connection can be used by any thread if the connection is not busy.

Restriction

Support for this feature is currently not available under CICS, Com-plete, and IDMS/DC.

Considerations for Users without Adabas

For customers who do not have Adabas installed at their site,

- we recommend installing the Adabas modules delivered with EntireX in the library WAL825.
- the Adabas modules will greatly improve performance if the transport method NET is used and broker kernel and applications (client or server) communicating through the stub to the broker kernel on the same machine locally, see Setting Transport Methods for Broker Stubs.

For information on how to install the Adabas SVC and install Adabas with TP Monitors, see *Installing Adabas Components for EntireX under z/OS* in the z/OS installation documentation.

7 Broker Command-line Utilities

ETBINFO	15	56
ETBCMD	16	63

EntireX Broker provides internal services: Command Services and Information Services, which can be used to administer and monitor the EntireX Broker. Because these services are implemented internally, nothing has to be started or configured. You can use these services immediately after starting EntireX Broker.

ETBINFO

Queries the Broker for different types of information, generating an output text string with basic formatting. This text output can be further processed by script languages. ETBINFO uses data descriptions called profiles to control the type of data that is returned for a request. ETBINFO is useful for monitoring and administering EntireX Broker efficiently, for example how many users can run concurrently and whether the number of specified message containers is large enough.

Although basic formatting of the output is available, it is usually formatted by script languages or other means external to the Broker.

- Running the Command-line Utility
- Command-line Parameters
- Command-line Parameters from File
- Profile
- Format String

Running the Command-line Utility

In a z/OS environment, the command-line utility is run as shown below.

Note: The service data set name and member cannot be accessed directly, but only indirectly by its DD name in the JCL.

```
//ETBINFO EXEC PGM=ETBINFO,
// PARM=('ENVAR(''ETB_STUBLOG=0'')/ -p "//''EXX951.JOBS(BROKER)''" ',
    '-bbrokerid -dBROKER -xuid -ypwd')
//STEPLIB DD DISP=SHR,DSN=< EXB-load-lib >
//
          DD
               DISP=SHR, DSN=< EXX-load-lib >
          DD
//
               DISP=SHR, DSN=< WAL-load-lib >
//TRACE1
          DD
               SYSOUT=*
                                                     stublog
//SYSOUT
          DD
               SYSOUT=*
                                                     stderr
//SYSPRINT DD
               SYSOUT=*
                                                     stdout
```

The SVC number specified in the ADARUN parameter must match the SVC number used for the target Broker ID.

Command-line Parameters

The table below explains the command-line parameters. The format string and profile parameters are described in detail following the table. All entries in the Option column are case-sensitive.

Option	Command-line Parameter	Req/ Opt	Explanation					
- b	brokerid	R	Broker identifier, for example localhost:1971:TCP.					
- C	class	О	Class as selection crit	Class as selection criterion.				
- C	csvoutput	О	Comma-separated variable output, suitable for input into a spreadsheet or other analysis tool. Any format string specified by means of format string or profile command-line parameters is ignored.					
- d	object	R	Possible values:					
			Object	Provides Info on				
			BROKER	Broker.				
			CLIENT	Client.				
			CMDLOG-FILTER	Command log filter.				
			CONVERSATION	Conversation.				
			NET	Entire Net-Work transport.				
			PARTICIPANT	Participant.				
			POOL-USAGE	Broker pool usage.				
			PSF	Unit-of-work status.				
			PSFADA	Adabas persistent store.				
			PSFCTREE	c-tree persistent store.				
			PSFDIV	DIV persistent store.				
			PSFFILE	FILE persistent store.				
			PUBLICATION	Publication.				
			PUBLISHER	Publisher.				
			RESOURCE-USAGE	Broker resource usage.				
			SECURITY	EntireX Security.				
			SERVER	Server.				
			SERVICE	Service.				
			SSL	SSL transport.				
			STATISTICS	Broker statistics.				
			SUBSCRIBER	Subscriber.				
			TCP	TCP transport.				
			TOPIC	Topic.				
			USER	Participant (short).				

Option	Command-line Parameter	Req/ Opt	Explanation
			WORKER Worker. WORKER-USAGE Worker usage.
- e	recv class	О	Receiver's class name. This selection criterion is valid only for object PSF.
- f	Format String	О	Format string how you expect the output. See <i>Profile</i> .
- g	recv service	Ο	Receiver's service name. This selection criterion is valid only for object PSF.
- h	help	О	Prints help information.
- i	convid	Ο	Conversation ID as selection criterion. Only valid for object CONVERSATION.
- I	conv type	0	Conversation's type.
- j	recv server	Ο	Receiver's server name. This selection criterion is valid only for object PSF.
- k	recv token	О	Receiver's token. This selection criterion is valid only for object PSF.
-1	level	0	The amount of information displayed: FULL All information. SHORT User-specific information.
- m	recv userid	О	Receiver's user ID. This selection criterion is valid only for object PSF.
- n	server name	Ο	Server name. This selection criterion is valid only for the objects SERVER, SERVICE or CONVERSATION.
- p	pds(member)	0	Here you can specify a PDS member that defines the layout of the output. There are default files you can modify or you can use your own. The default files are:
			BROKER CLIENT CLOGFLT CONV NET
			POOL PSF PSFADA PSFCTREE PSFDIV
			PSFFILE PUBLIC PUBSHR RESOURCE SECURITY
			SERVER SERVICE SSL STATIS SUBSCBR
			TCP TOPIC USER WORKER WKRUSAGE See <i>Profile</i> .
- q	puserid	0	Physical user ID. This selection criterion is valid only for objects CLIENT, SERVER, CONVERSATION, SUBSCRIBER, PUBLISHER or PUBLICATION. Note: Must be a hex value.
- P	publication id	0	Publication ID. This selection criterion is valid only for object PUBLICATION.
- r	sec	0	Refresh information after seconds.

Option	Command-line Parameter	Req/ Opt	Explanation
- S	service	0	Service. This selection criterion is valid only for objects SERVER, SERVICE or CONVERSATION.
- S	"sslparms"	0	When using SSL transport.
-t	token	0	This selection criterion is valid only for objects CLIENT, SERVER, SERVICE, CONVERSATION, SUBSCRIBER, PUBLISHER, PUBLICATION or TOPIC.
- T	topic	Ο	Topic name. This selection criterion is valid only for objects PUBLICATION, SUBSCRIBER, PUBLISHER, or TOPIC.
- u	userid	Ο	User ID. This selection criterion is only valid for the display types CLIENT, SERVER, SERVICE, CONVERSATION, SUBSCRIBER, PUBLISHER, PUBLICATION or TOPIC.
- U	subscr type	Ο	Subscriber's subscription type. This selection criterion is valid only for object SUBSCRIBER.
- V	UOW status	О	Unit of work status. This selection criterion is valid only for object PSF.
- W	UOW ID	О	Unit of work ID. This selection criterion is valid only for object PSF.
- X	userid	О	User ID. For security purposes.
- y	password	О	Password. For security purposes.
- Z	token	Ο	Used with userid to uniquely identify a caller to Command and Information Services.

Command-line Parameters from File

ETBINFO supports an alternative method of passing command-line parameters.

If the DDNAME INFFILE is allocated, using

```
//INFFILE DD DISP=SHR,DSN=pds(member)
```

and no command-line parameters are specified in the EXEC instruction, the content of the allocated member is evaluated. See sample member below (the apostrophes are included to show the record format (LRECL 80):

```
'-blocalhost:3930:TCP
'-dBROKER '
```

If ETBINFO is configured using INFFILE and a profile is specified, the syntax of the -p is as follows:

```
-p//'dsname(member)' if a PDS member is used-p//'dsname' if a sequential data set is used
```

The syntax is based on IBM conventions for fopen.

Caution: Make sure INFFILE does not contain line numbers in columns 73-80. If line nubmers are present, arguments are not passed correctly.

Profile

If you do not use the profile option or a format string, your output will be an unformatted list with all columns of that display type. To display specific columns, specify a profile that includes only those columns.

The following default sample profiles include all the columns defined for each display type:

```
BROKER
PSFCTREE
SERVICE
CLIENT
PSFDIV
SSL
CLOCFLT
PSFFILE
STATIS
SUBSCBR
NET
PUBSHR
TCP
POOL
RESOURCE
TOPIC
PSF
SECURITY
USER
PSFADA
SERVER
WKRUSAGE
WORKER
```

You can either delete the columns not required or copy the default profile and modify the order of the columns. Ensure that the column names have a leading "%". Column names can be written in one line or on separate lines. The output is always written side by side.

Location of Profiles

On z/OS, the profiles used to control the format of data displayed are members of the EXB source library and are named SERVER, CLIENT, etc. They can be saved as either sequential files or PDS members.

Example 1

Profile for object SERVICE: SERVICE.

```
//ETBINFO EXEC PGM=ETBINFO,PARM=('/-b ETBO01::NET -d SERVICE ',
// '-p "//'EXX951.JOBS(SERVICE)''" -1 FULL -xUID')
```

The following list is displayed:

SAG	ETBCIS	INFO
1 0 16 86400 0 31647 0 00 00 00	00 0 0	
SAG	ETBCIS	USER-INFO
2 0 16 86400 0 31647 0 00 00 00	00 0 0	
SAG	ETBCIS	CMD
6 0 16 86400 0 31647 0 00 00 00	00 0 0	

Example 2

Your own profile: MYPROF

```
//ETBINFO EXEC PGM=ETBINFO,PARM=('/-b ETBO01::NET -d SERVICE ',
// '-p "//''EXX951.JOBS(MYPROF)''" -xUID')
```

Note: In this case, MYPROF contains: %4.4SERVERCLASS %SERVERNAME

The following list is displayed:

```
ACLA ASERVER
BCLA BSERVER
CCLA CSERVER
```

Sample Profiles for ETBINFO

You can find the sample profiles for ETBINFO in your EXB source library.

Format String

The format string, if specified, will override the use of a profile. The format string is built like a printf() in C language. The string must be enclosed in quotation marks. You can specify the columns by using a "%" and the column name. The column name must contain letters only. Numeric characters are not allowed. You can specify the length of column output by using a format precision, as in the ANSI-C printf() function. The column name must be followed by a blank. For example:

```
etbinfo -b ETB001 - BROKER -f "%12.12CPLATNAME %NUM-SERVER %NUM-CLIENT"
```

which gives, for example:

```
MVS/SP 7.04 30 100
```

You can also use an arbitrary column separator, which can be any character other than "%". You can use \n for a new line in the output and \t for a tabulator in the format string or profile. For example:

```
etbinfo -b ETB001 -d SERVER -f "UserID: %5.5USER-ID Token: %5.5TOKEN"
```

which gives:

```
UserID: HUGO Token: MYTOK
UserID: EGON Token:
UserID: HELMU Token: Helmu
```

If you want to structure your output a little more, you can operate with the \n or \t character. For example:

```
etbinfo -b ETB001 -d SERVICE -f "Class:%5.5SERVER-CLASS \n\tName:%5.5SERVER-NAME ↔ \n\tService:%5.5SERVICE"
```

which produces:

```
Class:DATAB
Name:DB10
Service:Admin
Class:PRINT
Name:LPT1
Service:PRINT
...
```

ETBCMD

Allows the user to take actions - for example purge a unit of work, stop a server, shut down a Broker - against EntireX Broker.

- Running the Command-line Utility
- Command-line Parameters
- Command-line Parameters from File
- List of Commands and Objects
- Examples

Running the Command-line Utility

In a z/OS environment, run the ETBCMD command-line utility like this:

```
//ETBCMD EXEC PGM=ETBCMD,
// PARM=('ENVAR(''ETB_STUBLOG=0'')/ -bbrokerid ',
       '-dBROKER -c... -xuid -ypwd')
//STEPLIB DD DISP=SHR,DSN=< EXB-load-lib >
//
          DD
               DISP=SHR,DSN=< EXX-load-lib >
//
          DD
              DISP=SHR.DSN=< WAL-load-lib >
          DD
//TRACE1
               SYSOUT=*
                                                     stublog
//SYSOUT
          DD SYSOUT=*
                                                     stderr
//SYSPRINT DD
               SYSOUT=*
                                                     stdout
//
```

The SVC number specified in the ADARUN parameter must match the SVC number used for the target Broker ID.

Command-line Parameters

The table below explains the command-line parameters. All entries in the **Option** column are case-sensitive.

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
brokerid	- b	e.g. ETB001	R	Broker ID.
command	- C	ALLOW-NEWUOWMSGS	R	Command to be performed. See <i>List</i>
		CLEAR-CMDLOG-FILTER		of Commands and Objects below.
		CONNECT-PSTORE		
		■ DISABLE-ACCOUNTING		
		■ DISABLE-CMDLOG-FILTER		
		■ DISABLE-CMDLOG		

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
		■ DISABLE-DYN-WORKER		
		■ DISCONNECT-PSTORE		
		■ ENABLE-ACCOUNTING		
		■ ENABLE-CMDLOG-FILTER		
		■ ENABLE-CMDLOG		
		■ ENABLE-DYN-WORKER		
		■ FORBID-NEWUOWMSGS		
		■ PING		
		■ PRODUCE-STATISTICS		
		■ PURGE		
		■ RESET-USER		
		■ RESUME		
		■ SET-CMDLOG-FILTER		
		■ SHUTDOWN		
		■ START		
		■ STATUS		
		■ STOP		
		■ SUBSCRIBE		
		■ SUSPEND		
		■ SWITCH-CMDLOG		
		■ TRACE-FLUSH		
		■ TRACE-OFF		
		■ TRACE-ON		
		■ TRAP-ERROR		
		■ UNSUBSCRIBE		
object type	- d	■ BROKER	R	The object type to be operated on.
		■ CONVERSATION		See <i>List of Commands and Objects</i> below.
		■ PARTICIPANT		
		■ PSF		Within EntireX Broker nomenclature, a participant is an application
		■ SUBSCRIBER		implicitly or explicitly logged on to
		■ SECURITY		the Broker as a specific user. A
		■ SERVER		participant could act as client, server, publisher or subscriber.
		■ SERVICE		

Command-line Parameter	Option	Parameter	Req/ Opt	Explanation
		■ SUBSCRIBER		
		■ TRANSPORT		
	-е	errornumber	0	Error number being trapped.
	- E		О	Exclude attach servers from service shutdown.
help	- h		О	Prints help information.
class/server/service	- n	class/server/service	О	Service triplet.
option	- 0	■ IMMED	О	Command option.
		■ QUIESCE		
		■ LEVEL n , where n =1-8		
puserid	- p	puserid	О	Physical User ID. For SERVER and PARTICIPANT objects only. This must be a hex value.
sslparms	- S	SSL parameters	О	When using SSL transport.
seqno	- S	sequence number	О	Sequence number of participant.
token	-t	token	О	Token. For PARTICIPANT and SUBSCRIBER objects only.
topic	- T	topic	О	Topic name. For SUBSCRIBER object only.
uowid	- u	uowid	0	Unit of work ID. For PSF object only.
userid	- U	userid	0	User ID. For PARTICIPANT and SUBSCRIBER objects only.
secuserid	- X	userid	0	User ID for security purposes.
transportid	- X	Transport ID	0	One of the following: $COM NET SSL Snn TCP Tnn. See$ table below.
secpassword	- y	password	0	Password for security purposes.

Transport ID Values

This table explains the possible values for parameter transportid:

Transport ID	Explanation
COM	all communicators
NET	NET transport communicator
SSL	all SSL communicators
S00	SSL communicator 1
S01	SSL communicator 2
S02	SSL communicator 3
S03	SSL communicator 4
S04	SSL communicator 5
TCP	all TCP/IP communicators
Т00	TCP/IP communicator 1
T01	TCP/IP communicator 2
T02	TCP/IP communicator 3
T03	TCP/IP communicator 4
T04	TCP/IP communicator 5

Command-line Parameters from File

ETBCMD supports an alternative method of passing command-line parameters.

If the DDNAME CMDFILE is allocated, using

```
//CMDFILE DD DISP=SHR,DSN=pds(member)
```

and no command-line parameters are specified in the EXEC instruction, the content of the allocated member is evaluated. See sample member below (the apostrophes are included to show the record format (LRECL 80):

```
'-blocalhost:3930:TCP
'-dBROKER '
```

Caution: Make sure CMDFILE does not contain line numbers in columns 73-80. If line nubmers are present, arguments are not passed correctly.

List of Commands and Objects

This table lists the available commands and the objects to which they can be applied.

				Obj	ect			
Command	BROKER	CONVERSATION	PARTICIPANT	PSF	SECURITY	SERVER	SERVICE	SUBSCRIBER
ALLOW-NEWUOWMSGS				x				
CLEAR-CMDLOG-FILTER	x							
CONNECT-PSTORE				x				
DISABLE-ACCOUNTING	x							
DISABLE-CMDLOG-FILTER	x							
DISABLE-CMDLOG	x							
DISCONNECT-PSTORE				x				
ENABLE-ACCOUNTING	x							
ENABLE-CMDLOG-FILTER	x							
ENABLE-CMDLOG	x							
FORBID-NEWUOWMSGS				х				
PING	х							
PRODUCE-STATISTICS	х							
PURGE				x				

				Obj	ect			
Command	BROKER	CONVERSATION	PARTICIPANT	PSF	SECURITY	SERVER	SERVICE	SUBSCRIBER
RESET-USER					х			
SET-CMDLOG-FILTER	x							
SHUTDOWN	x	х	х			x	х	
SUBSCRIBE								х
SWITCH-CMDLOG	x							
TRACE-OFF	x			x	x			
TRACE-ON	x			x	x			
UNSUBSCRIBE								х

Examples

Example	Description
etbcmd -h	Displays ETBCMD help text.
etbcmd -b etb001 -d BROKER -c TRACE-OFF	Turns Broker tracing off.
etbcmd -b etb001 -d BROKER -c TRACE-ON -o LEVEL2	Sets Broker trace level to 2.
etbcmd -b etb001 -d BROKER -c SHUTDOWN	Performs Broker shutdown.
etbcmd -b etb001 -d SERVICE -c SHUTDOWN -o IMMED -n ACLASS/ASERVER/ASERVICE	Shutdown service CLASS=ACLASS, SERVER=ASERVER, SERVICE=ASERVICE. See also SHUTDOWN SERVICE under Broker Command and Information Services for more information on shutdown options.
	Create list of servers and shutdown specific server in two steps (first step uses ETBINFO). See also SHUTDOWN SERVER under Broker Command and Information Services.
etbinfo -b etb001 -d SERVER -1 FULL -f"%USER-ID %SEQNO"	1. Determine a list of all servers with sequence numbers.
etbcmd -b etb001 -d SERVER -c SHUTDOWN -o IMMED -S32	2. Shutdown server with sequence number 32.
etbcmd -b etb001 -d BROKER -c PING	Performs an EntireX ping against the Broker.
etbcmd -b etb001 -d PSF -c DISCONNECT-PSTORE	Disconnects the Broker PSTORE.
etbcmd -b etb001 -d PSF -c CONNECT-PSTORE	Connects the Broker PSTORE.

Example	Description
etbcmd -b etb001 -d PSF -c PURGE -u 100000000000001A	Purges a unit of work.
etbcmd -b etb001 -d PSF -c ALLOW-NEWUOWMSGS	Allows new units of work to be stored.
etbcmd -b etb001 -d PSF -c FORBID-NEWUOWMSGS	Disallows new units of work to be stored.
etbcmd -b etb001 -d SUBSCRIBER -c SUBSCRIBE -U U1 -t t1 -T NYSE	Subscribes subscriber to topic NYSE.
etbcmd -b etb001 -d SUBSCRIBER -c UNSUBSCRIBE -U U1 -t t1 -T NYSE	Unsubscribes subscriber from topic NYSE.

8 Operator Commands

Command Syntax	172
General Broker Commands	
Participant-specific Commands	
Security-specific Commands	
Transport-specific Commands	
XCOM-specific Commands	

Command Syntax

The following command format is required to communicate with EntireX Broker, using the operator console. Parameters in UPPERCASE must be typed "as is". Parameters in lowercase must be substituted with a valid value.

Operator commands have the following format:

```
F taskname, APPL=command[parameter]
```

```
where taskname is the name of the EntireX Broker started task or job at your installation

command is the operator command

parameter is an optional parameter allowed by the operator command you are issuing
```

General Broker Commands

The following broker commands are available:

- BROKER TRACE
- DPOOL
- DRES
- DSTAT
- DWM
- ETBEND
- ETBSTOP
- FLUSH
- PSTORE TRACE
- SHUTDOWN class, server, service
- TRACE
- TRAP-ERROR

BROKER TRACE

Alias of broker command TRACE. Modifies the setting of the broker-specific attribute TRACE-LEVEL.

Example

To set a trace level 2 for broker

■ Enter command:

```
/F taskname, APPL=BROKER TRACE=2
```

See TRACE-LEVEL under Broker Attributes in the administration documentation.

DPOOL

Lists all memory pools currently allocated by EntireX Broker. Start address, pool size in bytes and name of pool are provided. There can be multiple entries for a specific type of pool.

Sample Output

```
ETBM0720 Operator typed in: DP00L
ETBM0657 Broker pool usage:
ETBM0657 0x2338FFB8
                    16781380 bytes COMMUNICATION POOL

ETBM0582 Function completed
```

DRES

Displays EntireX Broker's resource usage for conversations, message buffers, participants, services, topics, the timeout queue, units of work, and the work queue. Resource usage provides the total number, the number of free elements, and the number of used elements.

Sample Output

ETBM0581 Broker resource usage: ETBM0581 Resource	ETBM0720 Operator typed in: DRES				
ETBM0581 Conversations 4096 852 3244 ETBM0581 Long message buffers 0 0 0 ETBM0581 Short message buffers 8192 7384 808 ETBM0581 Participants 256 235 21 ETBM0581 Services 256 240 16 ETBM0581 Topics 0 0 0 ETBM0581 Timeout Queue 1280 845 435 ETBM0581 Units Of Work 0 0 0 ETBM0581 Work Queue 256 239 17	ETBM0581 Broker resource usage:

DWM

If broker attribute DYNAMIC-WORKER-MANAGEMENT=YES is activated, use command DWM=OFF to switch off dynamic worker management, or DWM=ON to reactivate it.

Example

- To deactivate dynamic worker management
- Enter command:

```
/F taskname, APPL=DWM=OFF
```

See *Dynamic Worker Management* under *Broker Resource Allocation* in the general administration documentation.

ETBEND

Processing stops immediately. Current calls to the EntireX Broker are not allowed to finish.

ETBSTOP

Alias of *ETBEND*.

FLUSH

Flush all trace data kept in internal trace buffers to stderr (DD: SYSOUT). The broker-specific attribute TRMODE=WRAP is required.

PSTORE TRACE

Modifies the trace level for the Adabas persistent store (Adabas-specific attribute TRACE-LEVEL).

Example

- To set a trace level 2 for the Adabas persistent store
- Enter command:

```
/F taskname, APPL=PSTORE TRACE=2
```

See TRACE-LEVEL under *Broker Attributes* in the administration documentation.

SHUTDOWN class, server, service

Shuts down the specified service immediately and stops all servers that have registered this service.

Example

- ▶ To shutdown service CLASS=RPC, SERVER=SRV1, SERVICE=CALLNAT
- Enter command:

```
/F taskname, APPL=SHUTDOWN RPC, SRV1, CALLNAT
```

TRACE

Modifies the setting of the broker-specific attribute TRACE-LEVEL.

Sample Commands

- To modify the trace level
- Enter command, for example:

```
/F taskname, APPL=TRACE=0
/F taskname, APPL=TRACE=1
/F taskname, APPL=TRACE=4
```

See TRACE-LEVEL under *Broker Attributes* in the administration documentation.

TRAP-ERROR

Modifies the setting of the broker-specific attribute TRAP-ERROR.

Sample Command

- To modify the setting for TRAP-ERROR
- Enter command:

/F taskname, APPL=TRAP-ERROR=nnnn

where *nnnn* is the four-digit API error number that triggers the trace handler.

See TRAP-ERROR under *Broker Attributes* in the administration documentation.

Participant-specific Commands

Within EntireX Broker nomenclature, a participant is an application implicitly or explicitly logged on to the Broker as a specific user. A participant could act as client, server, publisher or subscriber.

The following participant-specific commands are available:

- CANCEL parameter
- USERLIST
- USERS parameter

CANCEL parameter

Operator command CANCEL is used to delete participants from EntireX Broker. The following parameters are supported:

Parameter	Description
	Cancel all participants with the specified $user_id$. Non-persistent resources will be freed by the timeout manager. Prefix "USER=" is the default value and may be omitted.
,	Cancel the participant with the sequence number $seqno$. Non-persistent resources will be freed by the timeout manager. Operator commands <code>USERLIST</code> and <code>USERS</code> display sequence numbers of all selected participants.

Sample Commands

- To cancel all participant entries of user "DOE"
- Enter command:

```
/F taskname, APPL=CANCEL DOE
```

Or:

/F taskname, APPL=CANCEL USER=DOE

- To cancel participant with sequence number "11"
- Enter command:

```
/F taskname, APPL=CANCEL SEQNO=11
```

USERLIST

Operator command USERLIST displays a list of selected participant entries. The following parameters are supported:

Param	eter	Description Description		
none	ne * Display all participants.			
user_	_id	Display all participants with user ID $user_id$. Wildcard characters are supported.		

Sample Commands

To display all participants

■ Enter command:

```
/F taskname, APPL=USERLIST
Or:
/F taskname, APPL=USERLIST *
```

To display all participants with user ID "DOE"

■ Enter command:

```
/F taskname, APPL=USERLIST DOE
```

This produces the following output. See *Description of USERLIST Output Columns* below.

To display all participants with user ID starting with uppercase "D"

■ Enter command:

```
/F taskname, APPL=USERLIST D*
```

This produces the following output. See *Description of USERLIST Output Columns* below.

To display all participants with 4-character user ID, starting with uppercase "D" and with uppercase "E" as third character

■ Enter command:

```
/F taskname, APPL=USERLIST D?E?
```

This produces the following output. See *Description of USERLIST Output Columns* below.

Description of USERLIST Output Columns

Keyword	Description		
USER-ID	User ID (32 bytes, case-sensitive). See USER-ID under Broker ACI Fields.		
С	Client.		
	Y Participant is a client, otherwise "N".		
S	Server.		
	Y Participant is a server, otherwise "N".		
Р	Publisher.		
	Y Participant is a publisher, otherwise "N".		

Keyword	Description			
U	Subscriber.			
	Y Participant is a subscriber, otherwise "N".			
E	Big endian.			
	Y Participant is on a big-endian machine.			
	N Participant is on a little-endian machine.			
CHR	Character set.			
ASC Participant is an ASCII user.				
	EBC Participant is an EBCDIC user.			
SEQNO	Sequence number of participant. Can be used for operator command CANCEL parameter			

USERS parameter

Operator command USERS displays selected user data of participant entries. The following parameters are supported:

Parameter	Description
none *	Display all participants.
user_id	Display all participants with user ID $user_id$. Wildcard characters are supported.

Sample Commands

To display all participants

■ Enter command:

```
/F taskname, APPL=USERS
```

Or:

```
/F taskname, APPL=USERS *
```

- ▶ To display all participants with user ID "DOE"
- Enter command:

```
/F taskname, APPL=USERS DOE
```

This produces the following output. See *Description of USERS Output Columns* below.

```
ETBM0720 Operator typed in: USERS DOE
ETBM0687 Participants:
ETBM0687 USER-ID: DOE
ETBM0687 CLIENT: N SERVER: Y PUBLISHER: N SUBSCRIBER: N

ETBM0687 202073756E6578322D2D30303030324646462D2D3030303030303031
ETBM0687 TOKEN:
ETBM0582 Function completed
```

Description of USERS Output Columns

Keyword	Description			
USER-ID	User ID (32 bytes, case-sensitive). See USER-ID under Broker ACI Fields.			
CLIENT				
	Y Participant is a client, otherwise "N".			
SERVER				
	Y Participant is a server, otherwise "N".			
PUBLISHER				
	Y Participant is a publisher, otherwise "N".			
SUBSCRIBER				
	Y Participant is a subscriber, otherwise "N".			
BIG ENDIAN				
	Y Participant is on a big-endian machine.			
	N Participant is on a little-endian machine.			
CHARSET				
	ASC Participant is an ASCII user.			
	EBC Participant is an EBCDIC user.			
PUID	Internal unique ID of participant. Hexadecimal 28-byte value in printable format.			
TOKEN	Optionally identifies the participant. See TOKEN under <i>Broker ACI Fields</i> .			

Security-specific Commands

DSECSTAT

Displays the number of successful and failed Security authentications and Security authorizations.

Sample Output

```
ETBM0720 Operator typed in: DSECSTAT
ETBM0579 Security Authentications - successful: 20 failed: 0
ETBM0579 Security Authorizations - successful: 0 failed: 0
```

RESET userid

Resets the Security context for the specified user ID.

Sample Output

```
ETBM0720 Operator typed in: RESET EXXBATCH
ETBM0578 Reset ACEE for SAF-ID EXXBATCH : 20 instances found
```

SECURITY TRACE

Modifies the trace level for the EntireX Security (security-specific attribute TRACE-LEVEL). Broker-specific attribute SECURITY=YES must be set.

Example

To set a trace level 2 for EntireX Security

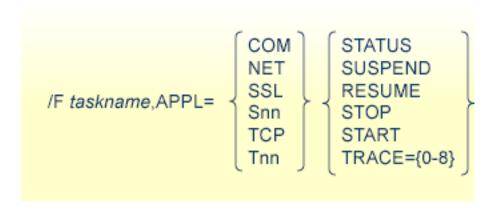

■ Enter command:

```
/F taskname, APPL=SECURITY TRACE=2
```

See TRACE-LEVEL under Broker Attributes in the administration documentation.

Transport-specific Commands

Transport-specific commands are available for Adabas/Entire Net-Work communicators, SSL communicators and TCP communicators; the COM command can be used for all communicators. The following command syntax applies:

COM parameter

This command is executed by all configured transport communicators. The following parameters are supported:

Parameter	er Description			
STATUS	Displays the current status of the transport communicator.			
SUSPEND	Used to suspend the transport communicator. The transport communicator is halted but will not shut down. User requests receive response code 148.			
RESUME	Resume a suspended transport communicator. If the communicator was not suspended before, an error message will be displayed.			
STOP	Stop an active or suspended transport communicator. The transport communicator will shut down. All transport-specific resources will be freed. User requests receive response code 148.			
START	Start a transport communicator that was previously stopped. If the communicator was not stopped before, an error message will be displayed.			
TRACE	Sets the trace level for the transport method. If the global trace level (see <i>TRACE</i>) is set with command /F broker, APPL=TRACE=n this applies to <i>all</i> transport methods. This command will also override any existing transport-specific settings. If you subsequently enter command /F broker, APPL=TCP TRACE=m only the trace level for TCP/IP transport is modified.			

Parameter	Description			
	Note: With commands TCP Tnn , and SSL and Snn, the trace level is set for all TCP and SSL			
	communicators respectively. Setting a trace level for a single TCP or SSL instance is not supported. For example: although it is possible to submit the command			
	/F broker, APPL=T01 TRACE=1 this command sets the trace level for all TCP communicators.			

Sample Output

```
ETBM0720 Operator typed in: COM STATUS

ETBW0718 TCP Communicator 0 currently active

ETBW0718 SSL Communicator 0 currently suspended

ETBW0718 NET Communicator 0 currently suspended

XC00039I 00113 Total number of commands = 17

XC00057I 00113 Operator entry active

ETBM0720 Operator typed in: COM SUSPEND

ETBM0721 TCP Communicator 0 suspended

ETBM0721 TCP Communicator 1 suspended

ETBM0721 SSL Communicator 0 suspended

ETBM0721 NET Communicator 0 suspended
```

NET parameter

This command is executed by X-COM, the Adabas/Entire Net-Work communicator. See command COM above for a list of supported parameters.

Sample Output

```
ETBM0720 Operator typed in: NET STATUS
ETBW0718 NET Communicator 0 currently active
XC00039I 00113 Total number of commands = 17
XC00057I 00113 Operator entry active
```

SSL parameter

This command is executed by all SSL communicators. See command COM above for a list of supported parameters.

Sample Output

```
ETBM0720 Operator typed in: SSL STATUS
ETBW0718 SSL Communicator O currently active
```

To manipulate a specific communicator instance (max. five instances can be started), use the command \$00, \$01, \$02, \$03 or \$04 for the respective SSL instance.

TCP parameter

This command is executed by TCP communicators. See command COM above for a list of supported parameters.

Sample Output

```
ETBM0720 Operator typed in: TCP STATUS
ETBW0718 TCP Communicator 0 currently active
ETBW0718 TCP Communicator 1 currently active
```

```
ETBM0720 Operator typed in: TCP RESUME
ETBM0721 TCP Communicator 0 resumed
ETBM0721 TCP Communicator 1 resumed
```

To manipulate a specific communicator instance (max. five instances can be started), use the command T00, T01, T02, T03 or T04 for the respective TCP instance.

Sample Output

```
ETBM0720 Operator typed in: T00 STATUS
ETBW0718 TCP Communicator 0 currently active
```

```
ETBM0720 Operator typed in: T01 STATUS
ETBW0718 TCP Communicator 1 currently active
```

Sample Transport Commands

- To display status of all transport communicators
- Enter command:

/F taskname, APPL=COM STATUS

To suspend first TCP communicator

■ Enter command:

/F taskname, APPL=T00 SUSPEND

To stop all SSL transport communicators

■ Enter command:

/F taskname, APPL=SSL STOP

XCOM-specific Commands

XEND and XSTOP function independently of the transport mechanism. (They stop the Broker's processing immediately, whereby existing calls to the EntireX Broker are not allowed to finish.)

XABS

Displays the current number, and the highest number, of used bytes in the Adabas attached buffer pool to the console.

Note: This command operates on the Adabas transport mechanism only. It has no effect upon functions not related to the Adabas transport mechanism.

Sample Output

```
ETBM0720 Operator typed in: XABS
XC00090I 00113 Attached buffer usage
XC00091I 00113 Number of bytes in use = 0
XC00092I 00113 Highest number of bytes in use = 6400
```

XCQES

Displays the current number, and the highest number, of Adabas command queue elements to the console.

Note: This command operates on the Adabas transport mechanism only. It has no effect upon functions not related to the Adabas transport mechanism.

Sample Output

```
ETBM0720 Operator typed in: XCQES
XC00030I 00113 Number of active CQEs = 0
XC00031I 00113 Highest number of active CQEs = 1
```

XEND

Alias of ETBEND.

XHALT

New calls to the EntireX Broker are temporarily rejected. Processing is resumed by issuing the XSTART operator command. XHALT is an alias for command NET SUSPEND.

Note: This command operates on the Adabas transport mechanism only. It has no effect upon functions not related to the Adabas transport mechanism.

Sample Output

```
ETBM0720 Operator typed in: XHALT
ETBM0721 NET Communicator O suspended
```

XPARM

Displays the values of Adabas SVC, database ID, number of CQEs, number of attached buffers, and the application name for the Adabas transport to the console.

Note: This command operates on the Adabas transport mechanism only. It has no effect upon functions not related to the Adabas transport mechanism.

Sample Output

```
ETBM0720 Operator typed in: XPARM

XC00032I 00113 Parameters for this session:

XC00033I 00113 SVC = 249

XC00034I 00113 NODE = 00113

XC00035I 00113 NCQE = 00100

XC00036I 00113 NABS = 10000

XC00037I 00113 User application = ETBNUC
```

XSTART

Processing of new calls to the EntireX Broker, interrupted with the XHALT command, is resumed. XSTART is an alias of command NET RESUME.

Note: This command operates on the Adabas transport mechanism only. It has no effect upon functions not related to the Adabas transport mechanism.

Sample Output

```
ETBM0720 Operator typed in: XSTART
ETBM0721 NET Communicator O resumed
```

XSTAT

Displays the EntireX Broker statistics as console messages.

Note: This command operates on the Adabas transport mechanism only. It has no effect upon functions not related to the Adabas transport mechanism.

XSTOP

Alias of *ETBEND*.

XUSER

Displays the current number, as well as the highest number, of users actively issuing commands using the Adabas transport mechanism to the console.

Note: The number of users displayed with this operator command will not represent all of the Broker clients and servers but only the subset of users issuing commands using the Adabas transport mechanism. Command and Information Services provides comprehensive information about all Broker clients and servers.

9 Accounting in EntireX Broker

EntireX Accounting Data Fields	192
Using Accounting under z/OS	195
Example Uses of Accounting Data	197

This chapter describes the accounting records for Broker that can be used for several purposes, including:

application chargeback

for apportioning EntireX resource consumption on the conversation and/or the application level;

performance measurement

for analyzing application throughput (bytes, messages, etc.) to determine overall performance;

■ trend analysis

for using data to determine periods of heavy and/or light resource and/or application usage.

EntireX Accounting Data Fields

In the EntireX Accounting record, there are various types of data available for consumption by applications that process the accounting data:

Field Name	Accounting Version	Type of Field	Description
SMF Record Type	1	1-byte unsigned integer	Type of SMF record.
Record Write Time	1	Timestamp	SMF timestamp.
SMF system ID	1	4-byte string	ID of the SMF system.
SMF subsystem ID	1	4-byte string	ID of the SMF subsystem.
EntireX Broker ID	1	A32	Broker ID from attribute file.
EntireX Version	1	A8	Version information, v.r.s.p, where:
			v = version r = release s = service pack p = patch level
			for example 8.1.2.00
Platform of Operation	1	A32	Platform where EntireX is running.
EntireX Start Time	1	A14 Timestamp in "YYYYMMDDHHMMSS" format	Time EntireX was initialized in YYYYMMDDHHMMSS format.
Accounting Record Type	1	A1	It is always C for conversation. Future Types will have a different value in this field.
Client User ID	1	A32	USER-ID ACI field from the client in the conversation.
Client Token	1	A32	TOKEN field from the ACI from the client.

Field Name	Accounting Version	Type of Field	Description
Client Physical ID	1	A56	The physical user ID of the client, set by EntireX.
Client Communication Type	1	I1	Communication used by Client: 1 = Net-Work 2 = TCP/IP 3 = APPC 4 = WebSphere MQ 5 = SSL
Client Requests Made	1	I4	Number of Requests made by client.
Client Sent Bytes	1	I4	Number of bytes sent by client.
Client Received Bytes	1	I4	Number of bytes received by client.
Client Sent Messages	1	I4	Number of messages sent by client.
Client Received Messages	1	I4	Number of messages received by client.
Client Sent UOWs	1	I4	Number of UOWs sent by client.
Client UOWs Received	1	I4	Number of UOWs received by client.
Client Completion Code	1	I4	Completion code client received when conversation ended.
Server User ID	1	A32	USER-ID ACI field from the server in the conversation.
Server Token	1	A32	TOKEN field from the ACI from the server.
Server Physical ID	1	A56	The physical user ID of the server, set by EntireX.
Server Communication Type	1	I1	Communication used by Server:
			1 = Entire Net-Work 2 = TCP/IP 3 = APPC 4 = WebSphere MQ 5 = SSL
Server Requests Made	1	I4	Number of requests made by server.
Server Sent Bytes	1	I4	Number of bytes sent by server.
Server Received Bytes	1	I4	Number of bytes received by server.
Server Sent Messages	1	I4	Number of messages sent by server.
Server Received Messages	1	I4	Number of messages received by server.
Server Sent UOWs	1	I4	Number of UOWs sent by server.
Server Received UOWs	1	I4	Number of UOWs received by server.

Field Name	Accounting Version	Type of Field	Description
Server Completion Code	1	I4	Completion code server received when conversation ended.
Conversation ID	1	A16	CONV-ID from ACI.
Server Class	1	A32	SERVER-CLASS from ACI.
Server Name	1	A32	SERVER-NAME from ACI.
Service Name	1	A32	SERVICE from ACI.
CID=NONE Indicator	1	A1	Will be N if CONV-ID=NONE is indicated in application.
Restarted Indicator	1	A1	Will be R if a conversation was restarted after a Broker shutdown.
Conversation Start Time	1	A14 Timestamp in "YYYYMMDDHHMMSS" format	Time conversation began in YYYYMMDDHHMMSS format.
Conversation End Time	1	A14 Timestamp in "YYYYMMDDHHMMSS" format	Time conversation was cleaned up in YYYYMMDDHHMMSS format.
Conversation CPU Time	1	I4	Number of microseconds of CPU time used by the conversation
Client Security Identity	2	A32	Actual identity of client derived from authenticated user ID.
Client Application Node	2	A32	Node name of machine where client application executes.
Client Application Type	2	A8	Stub type used by client application.
Client Application Name	2	A64	Name of the executable that called the broker. Corresponds to the Broker Information Service field APPLICATION - NAME in the ACI Programming documentation.
Client Credentials Type	2	I1	Mechanism by which authentication is performed for client.
Server Security Identity	2	A32	Actual identity of server derived from authenticated user ID.
Server Application Node	2	A32	Node name of machine where server application executes.
Server Application Type	2	A8	Stub type used by server application.
Server Application Name	2	A64	Name of the executable that called the broker. Corresponds to the Broker Information Service field APPLICATION - NAME in the ACI Programming documentation.

Field Name	Accounting Version	Type of Field	Description
Server Credentials Type	2	I1	Mechanism by which authentication is performed for server.
Client RPC Library	3	A128	RPC Library referenced by Client when sending the only/first request message of the conversation.
Client RPC Program	3	A128	RPC Program referenced by Client when sending the only/first request message of the conversation.
Server RPC Library	3	A128	RPC Library referenced by Server when sending the only/first response message of the conversation.
Server RPC Program	3	A128	RPC Program referenced by Server when sending the only/first response message of the conversation.
Client IPv4 Address	4	A16	IPv4 address of the client.
Server IPv4 Address	4	A16	IPv4 address of the server.
Client Application Version	4	A16	Application version of the client.
Server Application Version	4	A16	Application version of the server.
Client IPv6 Address	5	A46	IPv6 address of the client.
Server IPv6 Address	5	A46	IPv6 address of the server.

Note: Accounting fields of any version greater than 1 are created only if the attribute AC-COUNTING-VERSION value is greater than or equal to the corresponding version. For example: accounting fields of version 2 are visible only if ACCOUNTING-VERSION=2 or higher is specified.

Using Accounting under z/OS

For Broker and for Broker Services, the ACCOUNTING attribute/parameter indicates if accounting records will be generated. Accounting records are written upon successful completion of a conversation. A conversation ending in an application error (such as a timeout) is considered to be a successful conversation.

- Attribute File
- Broker Services Parameters
- Retrieving Accounting Records
- Accounting Record Layouts

Notes

Attribute File

ACCOUNTING={NO | 128-255}

Set this parameter to "NO" (i.e., do not create accounting records) or to a number between 128 and 255, which specifies the SMF record type to use when writing the accounting records. In order to avoid conflicts with other applications that also produce SMF records, check with your z/OS systems programmer for an appropriate number. In addition, check with your z/OS systems programmer to ensure that the selected SMF record number is set up to be written.

Default value: NO

Broker Services Parameters

ACCOUNTING={NO | 128-255}

Set this parameter to "NO" (i.e., do not create accounting records) or to a number between 128 and 255, which specifies the SMF record type to use when writing the accounting records. In order to avoid conflicts with other applications that also produce SMF records, check with your z/OS systems programmer for an appropriate number. In addition, check with your z/OS systems programmer to ensure that the selected SMF record number is set up to be written.

Default value: NO

Retrieving Accounting Records

The standard IBM IFASMFDP utility program may be used to selectively offload Broker and Broker Services SMF records. Analysis and report routines - either user-written or those available from IBM or various software vendors - may subsequently be used to process the offloaded records.

```
//* Copies selected records from the "live" SMF data sets
//*
//* Replace nnn (OUTDD parameter) with a valid SMF record type
//*
//* Note: the "DISPLAY SMF" operator command will show the names of the
//* SMF data sets
//*
//IFASMFDP EXEC PGM=IFASMFDP
//SYSPRINT DD SYSOUT=*
//MAN1 DD DISP=SHR,DSN=SYS1.MAN1
//MAN2 DD DISP=SHR,DSN=SYS1.MAN2
//MAN3 DD DISP=SHR,DSN=SYS1.MAN3
//OUTPUT DD DISP=(MOD,CATLG),
// UNIT=SYSDA,SPACE=(TRK,(15,15),RLSE),
// DCB=(RECFM=VBS,LRECL=32760,BLKSIZE=0),
// DSN=EXX.SMF.RECORDS
```

```
//SYSIN DD *

DATE(2002001,2099366)

START(0000)

END(2359)

INDD(MAN1,0PTIONS(DUMP))

INDD(MAN2,0PTIONS(DUMP))

INDD(MAN3,0PTIONS(DUMP))

OUTDD(OUTPUT,TYPE(nnn))

//*
```

Note: The IBM publication *MVS System Management Facilities (SMF)* provides complete information on SMF.

Accounting Record Layouts

EntireX provides three mappings for its accounting records in the following members, all located in the EXX951.SRCE data set:

- EXXCACT A C language include file that maps the accounting record;
- EXXACTR An Assembler language MACRO that will generate a DSECT of the accounting record;
- EXXSACT An SAS DATA step that will read in a file with the appropriate field names.

Notes

- Since there is no server for Broker Command and Information Services, no server data is generated in the SMF records for Command and Information Services conversations.
- The unit for CPUTIME is expressed in microseconds.

Example Uses of Accounting Data

- Chargeback
- Trend Analysis

Tuning for Application Performance

Chargeback

Customers can use the EntireX accounting data to perform chargeback calculations for resource utilization in a data center. Suppose EntireX Broker is being used to dispatch messages for three business departments: Accounts Receivable, Accounts Payable, and Inventory. At the end of each month, the customer needs to determine how much of the operation and maintenance cost of EntireX Broker should be assigned to these departments. For a typical month, assume the following is true:

Department	Amount of Data	Percentage	Messages Sent	Percentage	Average Percentage
Accts Payable	50 MB	25	4000	20	22.5
Accts Receivable	40 MB	20	6000	30	25
Inventory	110 MB	55	10000	50	52.5

The use of Broker resources here is based upon both the amount of traffic sent to the Broker (bytes) as well as how often the Broker is called (messages). The average of the two percentages is used to internally bill the departments, so 52.5% of the cost of running EntireX Broker would be paid by the Inventory Department, 25% by the Accounts Receivable Department, and 22.5% by the Accounts Payable Department.

Trend Analysis

The Accounting Data can also be used for trend analysis. Suppose a customer has several point-of-sale systems in several stores throughout the United States that are tied into the corporate inventory database with EntireX. The stubs would be running at the stores, and the sales data would be transmitted to the Broker, which would hand it off to the appropriate departments in inventory. If these departments wish to ascertain when the stores are busiest, they can use the accounting data to monitor store transactions. Assume all of the stores are open every day from 9 AM to 10 PM.

Local Time	Average: Weekday Transactions per Store	Maximum Weekday Transactions in any Store	Average Weekend Transactions per Store	Maximum Weekend Transactions in any Store
9 AM	7.3	27	28.2	83
10 AM	11.2	31	29.3	102
11 AM	14.6	48	37.9	113
12 noon	56.2	106	34.8	98
1 PM	25.6	65	34.2	95
2 PM	17.2	52	38.5	102
3 PM	12.1	23	42.7	99

Local Time	Average: Weekday Transactions per Store	Maximum Weekday Transactions in any Store	Average Weekend Transactions per Store	Maximum Weekend Transactions in any Store
4 PM	18.3	34	43.2	88
5 PM	26.2	47	45.2	93
6 PM	38.2	87	40.6	105
7 PM	29.6	83	39.2	110
8 PM	18.6	78	28.6	85
9 PM	11.2	55	17.5	62

The owner of the stores can examine the data and make decisions based upon the data here. For example, on weekdays, he or she can see that there is little business until lunchtime, when the number of transactions increase. It then decreases during lunch hour; then there is another increase from 5 PM to 8 PM, after people leave work. Based on this data, the owner might investigate changing the store hours on weekdays to 10 AM to 9 PM. On the weekend the trends are different, and the store hours could be adjusted as well, although there is a more regular customer flow each hour on the weekends.

Tuning for Application Performance

Assume that a customer has two applications that perform basic request/response messaging for similar sized messages. The applications consist of many Windows PC clients and Natural RPC Servers on UNIX. An analysis of the accounting data shows the following:

Application Type	Class	Server			Average Client Messages Received per Conversation
Application 1:	CLASS1	SERVER1	SERVICE1	10.30	10.29
Application 2:	CLASS2	SERVER2	SERVICE2	10.30	8.98

A further analysis of the accounting data reveals that there are a lot of non-zero response codes in the records pertaining to Application 2, and that a lot of these non-zero responses indicate timeouts. With that information, the customer can address the problem by modifying the server code, or by adjusting the timeout parameters for SERVER2 so that it can have more time to get a response from the Service.

10 Broker Shutdown Statistics

Shutdown Statistics Output	20
Table of Shutdown Statistics	20

Shutdown Statistics Output

After a successful Broker execution, shutdown statistics and related information are produced. This output is written in the following sequence:

- 1. The diagnostic message ETBD0444 is written into the Broker trace log.
- 2. The output i.e. statistics, internals and user-specified parameters is written into the end of the Broker trace log file at shutdown.

Table of Shutdown Statistics

See *Legend* below for explanation of output type.

Output Type	Display Field	Description
U	Broker ID	Identifies the Broker kernel to which the attribute file applies. See BROKER-ID.
I	Version	The version of the Broker kernel currently running.
I	Generated platform family	The platform family for which this Broker kernel was built.
I	Runtime platform	The platform on which this Broker kernel is currently running.
I	Start time	The date and time when this Broker kernel started.
S	Restart count	The restart count indicates how many times the Broker kernel has been started with the persistent store. Therefore, after a cold start (PSTORE=COLD), the restart count will be 1. Then, after subsequent hot starts (PSTORE=HOT), the restart count will be 2 or greater.
U	Trace level	The value for the trace setting for this Broker kernel. See TRACE-LEVEL.
U	Worker tasks	The number of worker tasks for this Broker kernel. See NUM-WORKER.
U	MAX-MEMORY	The value of MAX-MEMORY or 0 if not defined. See MAX-MEMORY.
S	Memory allocated	Size of the allocated memory, in bytes.
S	Memory allocated HWM	Highest size of allocated memory in bytes since Broker started.
U	NUM-SERVICE	Value of NUM-SERVICE or 0 if not defined. See NUM-SERVICE.
S	Services active	The number of services currently active for this Broker kernel.
U	NUM-CLIENT	Value of NUM-CLIENT or 0 if not defined. See NUM-CLIENT.
S	Clients active	The number of clients currently active for this Broker kernel.
S	Clients active HWM	The high watermark for the number of clients active for this Broker kernel.

Output Type	Display Field	Description
U	NUM-SERVER	Value of NUM-SERVER or 0 if not defined. See NUM-SERVER.
S	Servers active	The number of servers currently active for this Broker kernel.
S	Servers active HWM	The high watermark for the number of servers active for this Broker kernel.
U	NUM-CONVERSATION	Value of NUM-CONVERSATION or 0 if not defined. See NUM-CONVERSATION.
S	Conversations active	The number of conversations currently active for this Broker kernel.
S	Conversations active HWM	The high watermark for the number of conversations active for this Broker kernel.
U	NUM-LONG-BUFFER	Value of NUM-LONG-BUFFER or 0 if not defined. See NUM-LONG-BUFFER.
S	Long buffers active	The number of long message buffers currently in use for this Broker kernel.
S	Long buffers active HWM	The high watermark for the number of long message buffers used for this Broker kernel.
U	NUM-SHORT-BUFFER	Value of NUM-SHORT-BUFFER or 0 if not defined. See NUM-SHORT-BUFFER.
S	Short buffers active	The number of short message buffers currently in use for this Broker kernel.
S	Short buffers active HWM	The high watermark for the number of short message buffers used for this Broker kernel.
U	NUM-TOPIC	Value of NUM-TOPIC or 0 if not defined. See NUM-TOPIC.
S	Topics active	The number of topics currently active for this Broker kernel.
U	NUM-PUBLISHER	Value of NUM-PUBLISHER or 0 if not defined.
S	Publishers active	The number of publishers currently active for this Broker kernel.
S	Publishers active HWM	The high watermark for the number of publishers active for this Broker kernel.
U	NUM-SUBSCRIBER	Value of NUM-SUBSCRIBER or 0 if not defined. See NUM-SUBSCRIBER.
S	Subscribers active	The number of subscribers currently active for this Broker kernel.
S	Subscribers active HWM	The high watermark for the number of subscribers active for this Broker kernel.
U	NUM-PUBLICATION	Value of NUM-PUBLICATION or 0 if not defined. See NUM-PUBLICATION.
S	Publications active	The number of publications currently active for this Broker kernel.
S	Publications active HWM	The high watermark for the number of publications active for this Broker kernel.

Display Field	Description	
Persistent store type	The type of persistent store used by this Broker kernel. See PSTORE-TYPE.	
UOW persistence	Indicates whether units of work are persistent or not in this Broke kernel. See STORE.	
Persistent store startup	Indicates the status of the persistent store at Broker startup. See PSTORE.	
Persistent status lifetime	The multiplier to compute the lifetime of the persistent status. See ${\tt UWSTATP}.$	
Deferred UOWs allowed	Indicates whether or not deferred units of work are allowed. See DEFERRED.	
Maximum allowed UOWs	The maximum number of units of work that can be active concurrently for this Broker kernel. See MAX-UOWS.	
Maximum messages per UOW	The maximum number of messages allowed in a unit of work. See MAX-MESSAGES-IN-UOW.	
UOW lifetime in seconds	Indicates the default lifetime for a unit of work. See UWTIME.	
Maximum message length	Indicates the maximum message size that can be sent. See MAX - UOW - MESSAGE - LENGTH.	
New UOW messages allowed	Indicates whether or not new units of work are allowed in this Broker kernel. See NEW-UOW-MESSAGES.	
UOWs active	The number of units of work currently active in this Broker kernel.	
Current UOW	The number of the last unit of work in this Broker kernel.	
Accounting	Indicates the status of accounting records in this Broker kernel. See ACCOUNTING.	
SSL port *	If applicable, the SSL port number on which this Broker kernel will listen for connection requests. See SSLPORT.	
TCP port *	If applicable, the TCP port number on which this Broker kernel will listen for connection requests. See TCPPORT.	
Number of function calls	Marks the beginning of the section of summary statistics for all the function calls.	
DEREGISTER	The number of Broker DEREGISTER function calls since startup.	
EOC	The number of Broker EOC function calls since startup.	
KERNELVERS	The number of Broker KERNELVERS function calls since startup.	
LOGOFF	The number of Broker LOGOFF function calls since startup.	
LOGON	The number of Broker LOGON function calls since startup.	
RECEIVE	The number of Broker RECEIVE function calls since startup.	
REGISTER	The number of Broker REGISTER function calls since startup.	
SEND	The number of Broker SEND function calls since startup.	
SYNCPOINT	The number of Broker SYNCPOINT function calls since startup.	
	Persistent store type UOW persistence Persistent store startup Persistent status lifetime Deferred UOWs allowed Maximum allowed UOWs Maximum messages per UOW UOW lifetime in seconds Maximum message length New UOW messages allowed UOWs active Current UOW Accounting SSL port * TCP port * Number of function calls DEREGISTER EOC KERNELVERS LOGOFF LOGON RECEIVE REGISTER SEND	

Output		
Туре	Display Field	Description
S	UNDO	The number of Broker UNDO function calls since startup.
S	CONTROL_PUBLICATION	The number of Broker CONTROL_PUBLICATION function calls since startup.
S	RECEIVE_PUBLICATION	The number of Broker RECEIVE_PUBLICATION function calls since startup.
S	SEND_PUBLICATION	The number of Broker SEND_PUBLICATION function calls since startup.
S	SUBSCRIBE	The number of Broker SUBSCRIBE function calls since startup.
S	UNSUBSCRIBE	The number of Broker UNSUBSCRIBE function calls since startup.
S	REPLY_ERROR	The number of Broker REPLY_ERROR function calls since startup.
I	Worker task statistics	Marks the beginning of the section of summary statistics for all the worker tasks.
I	Worker number	The identifier of the worker task.
I	Status	The status of the worker task at shutdown.
S	# of calls	The number of Broker calls handled by the worker task since startup.
S	Idle time in seconds	The number of seconds the worker task has been idle since startup.

^{*} Does not apply to z/OS.

Legend

Output Type	Description	Value	Origin of Value
I	Internal Information	Static	Determined by Software AG EntireX.
S	Shutdown Statistic	Variable	Determined by Broker activity during execution.
U	User-Specified Parameter	Variable	Specified by Broker administrator before or, if allowable, during execution.

11 Command Logging in EntireX

■ Introduction to Command Logging	
Command Log Filtering using Command-line Interface ETBCMD	
ACI-driven Command Logging	
■ Dual Command Log Files	

Command logging is a feature to assist in debugging Broker ACI applications. A command in this context represents one user request sent to the Broker and the related response of Broker.

Command logging is a feature that writes the user requests and responses to file in a way it is already known with Broker trace and TRACE-LEVEL=1. But command logging works completely independent from trace, and data is written to a file only if defined command trace filters detect a match.

Broker stub applications send commands or requests to the Broker kernel, and the Broker kernel returns a response to the requesting application. Developers who need to resolve problems in an application need access to those request and response strings inside the Broker kernel. That's where command logging comes in. With command logging, request and response strings from or to an application are written to a file that is separate from the Broker trace file.

Introduction to Command Logging

This section provides an introduction to command logging in EntireX and offers examples of how command logging is implemented. It covers the following topics:

- Overview
- Command Log Files
- Defining Filters
- Programmatically Turning on Command Logging

Overview

Command logging is similar to a Broker trace that is generated when the Broker attribute TRACE-LEVEL is set to 1. Broker trace and command logging are independent of each other, and therefore the configuration of command logging is separate from Broker tracing.

The following Broker attributes are involved in command logging:

Attribute	Description
CMDLOG	Set this to "N" if command logging is not needed.
CMDLOG-FILE-SIZE	A numeric value indicating the maximum size of command log file in KB.
NUM-CMDLOG-FILTER	The maximum number of filters that can be set.

In addition to CMDLOG=YES, the Broker needs the assignment of the dual command logging files during startup. If these assignments are missing, Broker will set CMDLOG=NO. See also *Broker Attributes* in the administration documentation.

Command Log Files

The Broker keeps a record of commands (request and response strings) in a command log file.

At Broker startup, you will need to supply two command log file names and paths. Only one file is open at a time, however, and the Broker writes commands (requests and responses) to this file.

Under z/OS, the file requirements are two equally sized, physical sequential files defined with a record length of 121 bytes, i.e.

DCB=(LRECL=121, RECFM=FB, BLKSIZE=nnnn). We recommend you allocate files with a single (primary) extent only. For example SPACE=(CYL, (30,0)). The minimum file size is approximately 3 cylinders of 3390 device. Alternatively, the dual command log files can be allowed in USS HFS file system.

When the size of the active command log file reaches the KB limit set by CMDLOG-FILE-SIZE, the file is closed and the second file is opened and becomes active. When the second file also reaches the KB limit set by CMDLOG-FILE-SIZE, the first file is opened and second file is closed. Existing log data in a newly opened file will be lost.

Defining Filters

In command logging, a filter is used to store and identify a class, server, or service, as well as a topic name and user ID.

Use the System Management Hub to define a filter. Under UNIX and z/OS you can also use command line tool etbcmd. During processing, the Broker evaluates the class, server, service, topic, and user ID associated with each incoming request and compares them with the same parameters specified in the filters. If there is a match, the request string and response string of the request is printed out to the command log file.

Programmatically Turning on Command Logging

Applications using ACI version 9 or above have access to the new field LOG-COMMAND in the ACI control block.

If this field is set, the accompanying request and the Broker's response to this request is logged to the command log file.

Note: Programmatic command logging ignores any filters set in the kernel.

Command Log Filtering using Command-line Interface ETBCMD

The examples assume that Broker has been started with the attribute CMDLOG=Y.

- Setting Filters
- Deleting Filters
- Disabling and Enabling a Filter

Setting Filters

Filters need to be set before running the stub applications whose commands are to be logged.

Command	Description
<pre>//ETBCMD EXEC PGM=ETBCMD, // PARM=('/-blocalhost:1970:TCP ↔ -cSET-CMDLOG-FILTER -xuser ', // '-dBROKER ↔ -nACLASS/ASERVER/ASERVICE')</pre>	This command sets filters on ACLASS/ASERVER/ASERVICE. All ACI calls issued by <i>all</i> users to this service will be logged.
<pre>//ETBCMD EXEC PGM=ETBCMD, // PARM=('/-blocalhost:1970:TCP ↔ -cSET-CMDLOG-FILTER -xuser ', // '-dBROKER -nACLASS/ASERVER/ASERVICE ↔ -Usaguser1')</pre>	This command sets filters on ACLASS/ASERVER/ASERVICE and user ID saguser1. All ACI calls to this service as well as those issued by saguser1 will be logged.
<pre>//ETBCMD EXEC PGM=ETBCMD, // PARM=('/-blocalhost:1970:TCP ↔ -cSET-CMDLOG-FILTER -xuser ', // '-dBROKER -TNYSE -Usaguser1')</pre>	This command sets filters on topic NYSE and user ID saguser1. All ACI calls to this topic as well as those issued by saguser1 will be logged.

Note: If more than one service or topic is set as a filter, all ACI calls sent to any of these services or topics will be logged. Identical filters cannot be set. Attempts to set a second filter that matches an existing filter will be rejected. Similarly, the maximum number of filters that can be added is defined in NUM-CMDLOG-FILTER. If the maximum number of filters is already being used, delete an existing filter to make room for a new filter.

Deleting Filters

The following provides an example of how to delete an existing filter on a service.

To delete a filter

■ Enter the following command.

```
//ETBCMD EXEC PGM=ETBCMD,
// PARM=('/-blocalhost:1970:TCP -cCLEAR-CMDLOG-FILTER -xuser ',
// '-dBROKER -nACLASS/ASERVER/ASERVICE')
```

If the filter does not exist, the command will return an error.

Disabling and Enabling a Filter

Filters can be set and still be disabled (made inactive).

To disable a filter

■ Enter the following command.

```
//ETBCMD EXEC PGM=ETBCMD,
// PARM=('/-blocalhost:1970:TCP -cDISABLE-CMDLOG-FILTER -xuser ',
// '-dBROKER -nACLASS/ASERVER/ASERVICE -Usaguser1')
```

Note: A disabled filter will not bring down the count of filters in use.

To enable a filter

■ Enter the following command to enable the disabled filter.

```
//ETBCMD EXEC PGM=ETBCMD,
// PARM=('/-blocalhost:1970:TCP -cENABLE-CMDLOG-FILTER -xuser ',
// '-dBROKER -nACLASS/ASERVER/ASERVICE -Usaguser1')
```

ACI-driven Command Logging

EntireX components that communicate with Broker can trigger command logging by setting the field LOG-COMMAND in the ACI control block.

When handling ACI functions with command log turned on, Broker will not evaluate any filters. Application developers must remember to reset the LOG-COMMAND field if subsequent requests are not required to be logged.

Dual Command Log Files

Broker's use of two command log files prevents any one command log file from becoming too large.

When starting a Broker with command log support, you must therefore specify two file names and paths - one for each of the two command log files. The sample startup script installed with the product uses the variables <code>ETB_CMDLOG1</code> and <code>ETB_CMDLOG2</code> as the default command log file names.

At startup, Broker initializes both files and keeps one of them open. Command log statements are printed to the open file until the size of this file reaches the value specified in the Broker attribute CMDLOG-FILE-SIZE. This value must be specified in KB.

When the size of the open file exceeds the value specified in the Broker attribute CMDLOG-FILE-SIZE, Broker closes this file and opens the other, dormant file. Because the Broker closes a log file only when unable to print out a complete log line, the size of a *full* file may be smaller than CMDLOG-FILE-SIZE.

To switch log files on demand, using ETBCMD

■ An open command log file can be forcibly closed even before the size limit is reached. Enter the following command.

```
//ETBCMD EXEC PGM=ETBCMD,
// PARM=('/-blocalhost:1970:TCP -cSWITCH-CMDLOG -xuser ',
// '-dBROKER')
```

The command above will close the currently open file and open the one that has been dormant.
