

Software AG IDL Extractor for webMethods Integration Server

The Software AG IDL Extractor for webMethods Integration Server is a wizard that reads a package from the Integration Server and generates a Software AG IDL file from all the existing services and nodes. Each service results in a program in the IDL file. All parameters of the services are mapped to an IDL alphanumeric data type, available as variable (AV) or fixed (An) length. From EntireX Adapter 9.7, mapping is described in this product's documentation.

Introduction	Introduction to the IDL Extractor for Integration Server.
Using	Using the IDL Extractor for Integration Server.

Preferences relevant for the IDL Extractor for Integration Server are identical to those for the Integration Server Wrapper. See *Integration Server Preferences*.
