

# Introduction to the Software AG IDL Extractor for XML Document

The Software AG IDL Extractor for XML Document generates a *Software AG IDL File* and a related XML mapping file (XMM) from a given XML document.

The *EntireX Workbench* provides a wizard to collect all necessary input. You can extract from either

- a remote location using a URL (see *Step 2: Select a Source* for supported protocols), or
- directly from your Eclipse workspace.
