

Using the IDL Extractor for XML Schema in Command-line Mode

See *Using the EntireX Workbench in Command-line Mode* for the general command-line syntax. The table below shows the command-line option for the IDL Extractor for XML Schema.

Task	Command	Option	Description
Extract an IDL file and an XMM file from an XML Schema.	-extract:xsd	-help	Display this usage message.
		-out	The XML Schema for the OUT direction, whereby the first XML Schema will be interpreted as IN direction, instead of INOUT direction.
		-project	Name of the project or subfolder where the IDL and XMM files are stored.

Example

```
<workbench> -extract:xsd /Demo/example.xsd
```

where *<workbench>* is a placeholder for the actual Workbench starter as described under *Using the EntireX Workbench in Command-line Mode*.

Status and processing messages are written to standard output (stdout), which is normally set to the executing shell window.
