About this Guide

This guide describes the basic components of CentraSite's run-time governance environment. Additionally, it describes how you can use the CentraSite graphical user interfaces to design and configure your run-time governance environment.

Document Conventions

Convention	Description
Bold	Identifies elements on a screen.
Narrowfont	Identifies storage locations for services on webMethods Integration Server, using the convention <i>folder.subfolder:service</i> .
UPPERCASE	Identifies keyboard keys. Keys you must press simultaneously are joined with a plus sign (+).
<i>Italic</i>	Identifies variables for which you must supply values specific to your own situation or environment. Identifies new terms the first time they occur in the text.
Monospace font	Identifies text you must type or messages displayed by the system.
{ }	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the symbol.
[]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [] symbols.
...	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...).

Online Information

Software AG Documentation Website

You can find documentation on the Software AG Documentation website at <http://documentation.softwareag.com>. The site requires Empower credentials. If you do not have Empower credentials, you must use the TECHcommunity website.

Software AG Empower Product Support Website

You can find product information on the Software AG Empower Product Support website at <https://empower.softwareag.com>.

To submit feature/enhancement requests, get information about product availability, and download products, go to [Products](#).

To get information about fixes and to read early warnings, technical papers, and knowledge base articles, go to the [Knowledge Center](#).

Software AG TECHcommunity

You can find documentation and other technical information on the Software AG TECHcommunity website at <http://techcommunity.softwareag.com>. You can:

- Access product documentation, if you have TECHcommunity credentials. If you do not, you will need to register and specify "Documentation" as an area of interest.
- Access articles, code samples, demos, and tutorials.
- Use the online discussion forums, moderated by Software AG professionals, to ask questions, discuss best practices, and learn how other customers are using Software AG technology.
- Link to external websites that discuss open standards and web technology.

1 Overview of Run-Time Governance

- Components of the Run-Time Governance Environment 16

Components of the Run-Time Governance Environment

When you use CentraSite to govern Web services at run time, the basic components in the run-time environment are:

- A policy enforcement point such as webMethods Mediator.

webMethods Mediator is a service mediation and policy enforcement application for Web services. The Web services can be SOAP-based, REST-based or plain XML Web services.

Mediator hosts virtual services, which are proxy services that receive requests from consumers on behalf of particular Web services. Mediator can also host virtualized APIs, which are proxy APIs for Web services that have been externalized as Application Programming Interfaces (APIs).

Mediator enforces the run-time governance policies or rules that you define for your virtual services or virtualized APIs (such as security enforcement and audit-trail logging) and handles mediation measures between consumer and provider (such as message transformation and message routing).

Besides serving as an intermediary between consumer applications and native services, Mediator also collects performance statistics and event information about the traffic flowing between consumers and the native services, and reports this data to CentraSite.

Mediator is designed for use with CentraSite. The Mediator application is delivered as a package called WmMediator, which runs on webMethods Integration Server. It provides an infrastructure for the run-time governance policies or rules that you define.

- Virtualized services or virtualized APIs.

You can choose to expose your Web services as virtualized services. When you create a virtualized service, you also define:

- Run-time governance policies for the virtualized service.
- The consumer applications that are used to allow consumers to access the virtualized service.

As an alternative to exposing your Web services as virtualized services, you can instead expose the Web services as virtualized APIs, which perform a role similar to virtualized services. When you virtualize an API, you also define:

- Policy enforcement rules for the API.
- API keys, which enable users to securely access the API.

You define all these components in CentraSite, and you store and manage them from CentraSite's UDDI registry/repository.

- Native services, which are Web services that process requests submitted by consumers. If a native service produces a response, it returns the response to the virtualized service or virtualized API, and the virtualized service or virtualized API returns it to the consumer.
- CentraSite, which serves several key roles in the run-time environment. Besides serving as the system of record for the artifacts in the SOA environment (such as virtualized services or virtualized APIs and their run-time governance policies or rules), CentraSite provides the tools you use to define these artifacts and deploy them to Mediator. Additionally, CentraSite receives and logs the performance metrics and event data collected by Mediator and provides tools for viewing this data.

Subsequent sections of the CentraSite documentation provide the information you need for designing and configuring your run-time governance environment in CentraSite. The following sub-sections provide a brief overview of those subsequent sections:

Run-Time Gateways

To use an instance of CentraSite with Mediator, you must define a run-time gateway that identifies the specific instance of Mediator that you want to use. A run-time gateway is a registry object that represents a particular instance of a policy enforcement point (in this case, an instance of webMethods Mediator). The gateway object specifies the address of the Mediator's deployment endpoint, which is the endpoint that CentraSite uses to interact with Mediator to deploy virtualized services or virtualized APIs.

If you use multiple Mediators with an instance of CentraSite, you must create a gateway for each Mediator. To make the Mediators easier to distinguish when they are viewed in CentraSite, consider adopting a naming convention for gateways that clearly identifies to which environment the gateway belongs (e.g., development, test, production). You can deploy any given virtualized service or virtualized API to one or more run-time gateways.

Instead of (or in addition to) using webMethods Mediator for mediation and/or policy enforcement, you can use other third-party products with CentraSite. Support for third-party policy-enforcement and run-time governance tools is available through integrations that are provided by members of the CentraSite Community. These tools are made available through the [Software AG TECHcommunity Website](#).

In addition to using Mediator, you can use webMethods Insight. Insight is an additional monitoring tool from Software AG that you can use with CentraSite. Insight enables you to see what is happening in real-time with service transactions as they flow across any system. It provides visibility and control at the transaction level to heterogeneous SOA environments. CentraSite provides support for Insight as a gateway type out-of-the-box. For more information about Insight's uses and capabilities, see the Insight user documentation.

Virtualized Services in CentraSite Control

If you choose to expose Web services as virtualized services, you need to:

- **Create the virtualized services.** A virtualized service is a service that runs on Mediator and acts as the consumer-facing proxy for a native service that runs elsewhere on the network. You can create virtualized services for Web services that are SOAP-based, REST-based or plain XML Web services. A virtualized service provides a layer of abstraction between the service consumer and the service provider, and promotes loose coupling by providing independence of location, protocol and format between the consuming application and the provider service. You create virtualized services using the CentraSite Control user interface, and store them in the CentraSite registry/repository.
- **Create run-time governance policies for the virtualized services.** A run-time governance policy is a sequence of actions that are carried out by a policy-enforcement point (such as Mediator) when a consumer requests a particular Web service through the policy-enforcement point. The actions in a run-time policy perform activities such as identifying/authenticating consumers, validating digital signatures and capturing performance metrics. You create run-time policies using the CentraSite Control user interface, and store them in the CentraSite registry/repository.
- **Create consumer applications, which specify the consumers that are allowed to consume services and other assets at run time.** A consumer application is a computer application that consumes (invokes) assets (services, BPEL processes or XML schemas) at run time. Typically, you create a consumer application to specify the consumers that are allowed to consume a particular asset. Then, you include the consumer application in the Consumers profile of the asset.

A consumer application defines the precise consumer identifiers (for example, a list of user names in HTTP headers, a range of IP addresses, etc.). Thus the policy enforcement point (such as Mediator) can identify or authenticate the consumers that are requesting an asset. You create consumer applications using the CentraSite Control user interface, and store them in the CentraSite registry/repository.

- **Deploy the virtualized services and consumer applications to Mediator.**

Virtualizing APIs Using the CentraSite Business UI

As an alternative to exposing your Web services as virtualized services, you can instead expose the Web services as virtualized APIs.

Like virtualized services, virtualized APIs run on Mediator and act as the consumer-facing proxy for a native service that runs elsewhere on the network. You can create a virtualized API for Web services that are SOAP-based, REST-based or plain XML Web services.

CentraSite provides an Application Programming Interface (API) Management platform that you can implement to expose Web services as virtualized APIs.

CentraSite's Application Programming Interface (API) Management platform enables enterprises to selectively externalize their new and existing assets as APIs across various channels, monitor the interface's lifecycle with an integrated infrastructure, and make sure the needs of developers and application using the API are met.

Application Program Interfaces (APIs) are the new distribution channel for CentraSite assets. With an integrated infrastructure, you can:

- Securely expose your APIs to external developers and partners (that is, any external entities with which your enterprise interacts, such as suppliers and other vendors, dealers and distributors, customers, government agencies, trade organizations and so forth).
- Provide design time and run time governance capabilities to the APIs.

To support this new distribution channel, CentraSite's API Management enables developers, architects and business developers to:

- Publish the right APIs into their organization's central registry.
- Discover APIs and use them to assemble new applications.
- Manage the entire process of creating, publishing, deploying, and retiring APIs.
- Obtain detailed information about an API, including: the list of its consumers; its technical support contacts; its disposition in the development lifecycle; usage tips; and performance data.
- Control access to CentraSite and to the metadata for individual APIs listed in the registry.
- Impose mandatory approval processes to ensure that APIs accepted into the SOA adhere to organizational standards and policies.
- Get notifications on the APIs they use.
- Model the lifecycle process associated with each API and specify the events that are to be triggered when an API transitions from one lifecycle state to another.

Run-Time Governance Reference Information

This guide provides details about:

- The run-time events and Key Performance Indicator (KPI) metrics that can be collected and reported for each virtualized service or virtualized API deployed in your system.

This section also describes how to configure CentraSite to receive the events and metrics from the policy-enforcement point (such as Mediator) that collects them.

- The run-time actions for virtualized services. (There is a separate set of run-time actions for virtualized APIs.)

You use these actions only when you are using CentraSite Control to create run-time policies for virtualized services. This section provides:

- An alphabetic reference of all actions and their parameters.
- A listing of the action evaluation order and action dependencies.
- Some common combinations of actions used to authenticate/identify consumers.
- The run-time actions for virtualized APIs.

You use these actions only when you are using the CentraSite Business UI to create policy enforcement rules for virtualized APIs. These actions are similar in functionality to the actions for virtualized services. This section provides:

- An alphabetic reference of all actions and their parameters.
- A listing of the action evaluation order and action dependencies.

2 Run-Time Gateways

■ Introduction to Gateways	22
■ Who Can Create and Manage Gateways?	22
■ Creating and Managing Gateways	22

Introduction to Gateways

To use an instance of CentraSite with webMethods Mediator or API-Portal, you must define a Mediator gateway or an API-Portal gateway that identifies the specific instance of Mediator, API-Portal, or other policy enforcement point that you want to use. The gateway instance specifies the address of the deployment endpoint, which is the endpoint that CentraSite uses to interact with Mediator or API-Portal to deploy virtual services or virtualized APIs.

Who Can Create and Manage Gateways?

To create and manage gateways, you must have the following roles:

- **Mediator Administrator** role for Mediator gateway
- **API-Portal Administrator** role for API-Portal gateway

In addition to the above, you can also assign the following permissions to a user for a gateway:

- Instance level full permission
- Instance level view only
- Instance level publish permission

For details about users, groups, roles, and permissions, see *Getting Started with CentraSite*.

Note: A user who belongs to and is assigned permissions to the assets of an organization will not be able to view and publish Mediator gateway assets created for a different organization.

Creating and Managing Gateways

Overview

You can create, update, list, and delete gateways in CentraSite using the following two methods:

- Command Line Interface
- CentraSite Business UI

Managing gateways using CentraSite Business UI is explained in this chapter. Refer to the “Managing Gateways from the Command Line” section in the *CentraSite Administrator’s Guide* for details on the gateway command line tool.

Note: The target model in CentraSite is deprecated starting with the 9.8 release. As a result:

- The **Add Target** action is deprecated in Control UI.
- You cannot edit the target details in Control UI. You can only view details such as: Name, Description, and Target Type of the existing Mediator targets.
- However, you can still deploy, undeploy, and redeploy Virtual APIs to Mediator gateway in Control UI.

Targets created in the previous versions will be migrated as Mediator gateways when you migrate the data. For details see *Upgrading webMethods and Intelligent Business Operations Products*.

Creating a Gateway Asset

Use the following procedure to create a gateway and save it to the CentraSite registry/repository.

Note: This procedure specifies how you can create a Mediator gateway. For detailed information on creating, listing, updating, deleting an API-Portal gateway, and how to use CentraSite with API-Portal gateway see *Using CentraSite with webMethods API-Portal* section in *Working with the CentraSite Business UI*.

To create a gateway

1. In CentraSite Business UI, click **Manage Governance Rules**.
2. Click the **Add Gateway** action to open the **Create New Gateway** page and complete the following fields:

Note: If you do not see **Add Gateway** in the action bar, it is probably because you are not assigned the required role or do not have the permission to perform the action in CentraSite.

Field	Description
Name	<i>Mandatory.</i> Assign a name to the gateway. The name specified here should be unique for an asset of this type in CentraSite.
Description	<i>Optional.</i> Write a description for the gateway.
Gateway	Select a gateway type. <ul style="list-style-type: none"> ■ API-Portal Used to establish a connection between CentraSite and the API-Portal instance.

Field	Description
	<ul style="list-style-type: none"> ■ <code>Mediator</code> Used to establish a connection between CentraSite and the Mediator instance. <p>Select the gateway type, <code>Mediator</code>. CentraSite displays the configuration options for Mediator gateway.</p>
Organization	<p>Choose an organization from the list to which you want to register the Mediator gateway.</p> <p>Note: The drop-down list shows only the organizations to which you are permitted to add Mediator gateways.</p>

3. Configure **CentraSite Communication Information (Mediator to CentraSite)**.

Field	Description
Username	<p><i>Mandatory.</i> The CentraSite user ID.</p> <p>Note: This user must have permission to update data for the APIs deployed on this Mediator instance, that is the <code>Create Asset</code> or <code>Manage Assets</code> permission. This user should also be part of the <code>MyMediatorGateway Synchronization Group</code> created for this Mediator instance.</p>
Password	<p><i>Mandatory.</i> The password for the user specified in Username.</p> <p>Note: The CentraSite Endpoint field shows the URL (scheme, host, and port) of the CentraSite Application Server Tier (CAST) in the format, <code><scheme>://<host>:<port></code>. The scheme is <code>http</code> or <code>https</code>. The host is the machine on which CAST is running, and port is the port on which CentraSite is listening. The value for the CentraSite Endpoint field is determined by the URL that you use to access the CentraSite Business UI.</p>

4. Configure the **Mediator Communication Information (CentraSite to Mediator)**.

Field	Description
Mediator Endpoint	<p><i>Mandatory.</i> Specify the URL of the Mediator instance.</p> <p>Format: <code>http://<host>:<port></code>.</p>

Field	Description
Use CentraSite Credentials	Select this option if you want to enable the reuse of existing CentraSite user credentials. If this checkbox is selected, CentraSite automatically disables the subsequent Username and Password fields.
Username	<p><i>Optional.</i> The Integration Server user who is permitted to deploy assets to this Mediator gateway. By default, only a member of the Integration Server's <code>Administrator</code> group is permitted to deploy assets to this gateway.</p> <div data-bbox="626 709 1349 1675" style="background-color: #f0f0f0; padding: 10px;"> <p>Note: This note explains how to permit other users to deploy assets to this target. Mediator exposes several Web service operations to allow CentraSite to manage deployed assets. This Web service is invoked by CentraSite any time a user deploys or undeploys a virtual service or consumer application to Mediator. The User and Password fields identify an Integration Server user who is permitted to execute the Integration Server services associated with Mediator's deployer service. After installation, only members of the Integration Server's "Administrator" group are permitted to invoke these services. However, administrators have the flexibility to allow their own users or groups to invoke them. Access to these services is controlled by an ACL, called <code>MediatorDeployer</code>. Initially, only the predefined "Administrator" group is assigned to this ACL. An Integration Server administrator can remove this group and add other groups or individual users. For example, you can create your own deployer group, (e.g., "MyDeployers") and add Integration Server user IDs to this group. Then, the user must update the <code>MediatorDeployer</code> ACL by removing the "Administrator" group and adding the "MyDeployers" group. Now, in the User and Password fields on this screen, you can specify any user ID that belongs to the "MyDeployers" group.</p> </div>
Password	<p><i>Optional.</i> The password of the Integration Server user who is permitted to deployment assets to this gateway. The default password is the Integration Server Administrator password.</p>

Field	Description
Sandbox	<p><i>Optional.</i> Choose the sandbox category to be used to classify the Mediator gateway instance.</p> <ol style="list-style-type: none"> Click Choose. The Sandbox List is displayed with the predefined sandbox categories: Development, Production, and Test. Select a sandbox category from the list. Click OK. For information on the Sandbox categories that CentraSite supports out-of-the-box, in Control UI, go to Administration > Taxonomies. In the Taxonomies page, navigate to Sandbox in the list of taxonomies. If you would like to use sandbox categories that are not supported by CentraSite, you can define custom categories.

- Click **Save**.

A gateway instance is created in the specified organization and stored in the CentraSite registry/repository. The Mediator gateway asset details page for the asset that you just created is displayed. For each Mediator gateway that is successfully created, CentraSite creates a *MyMediatorGateway* Synchronization Group, where *MyMediatorGateway* is the name of the Mediator gateway. You can add users who have access to the Mediator gateway to this group so that you can assign permissions to the group instead of assigning permission to individual users.

The procedure defined above only saves the gateway configuration. For details on publishing the Mediator gateway, refer to [Publishing the Gateway Instances](#).

Configuring Gateway Details

Use the following procedure to configure the Mediator gateway asset details:

- In CentraSite Business UI, click **Manage Governance Rules**.
- Search for all the `Mediator` gateway instances. CentraSite lists the gateway instances that you have access to along with a link to access each instance.
- Click on the instance that you want to configure to open the asset details page.
- Click **Edit**.
- If you have logged in as a user who is assigned the `Mediator Administrator` role, you can grant edit permissions to a specified user by clicking on the **Permission** action button.

6. Modify the asset details and click **Save**.

Publishing the Gateway Instances

Use the following procedure to publish the Mediator gateway instance that you created:

1. In CentraSite Business UI, click **Manage Governance Rules**.
2. Search for all the `Mediator` gateway instances. CentraSite lists the gateway instances that you have access to along with a link to access each instance.

Note: You will be able to view only the Mediator gateway instances that are part of your organization and to which you have publish access. For example, if you have publish access to the assets of an organization, `Org1`, you will not be able view Mediator gateways created for the organization, `Org2`.

3. Click on the instance that you want to publish. The asset details page is displayed.
4. Click **Publish** to create the gateway instance in the specified organization in CentraSite and publish the **CentraSite Communication Information** to Mediator. This information is updated in the **CentraSite Communication** page under Mediator Administration in Integration Server.

The **CentraSite Communication Information** is used to send events, metrics, and other information from Mediator to CentraSite.

Note: You can also publish the gateway instance to Mediator from the **Create New Gateway** page using the **Publish** button next to the **Save** button.

Deleting a Gateway Instance

To delete a Mediator gateway instance:

1. In CentraSite Business UI, click **Manage Governance Rules**.
2. Search for the `Mediator` gateway instance that you want to delete. CentraSite lists only the gateway instances that you have access to along with a link to access each instance.
3. Select the gateway instance that you want to delete.
4. Click **Delete**.

You can also delete the Mediator gateway instance from the asset details page using the **Delete** action.

3 Virtualized Services in CentraSite

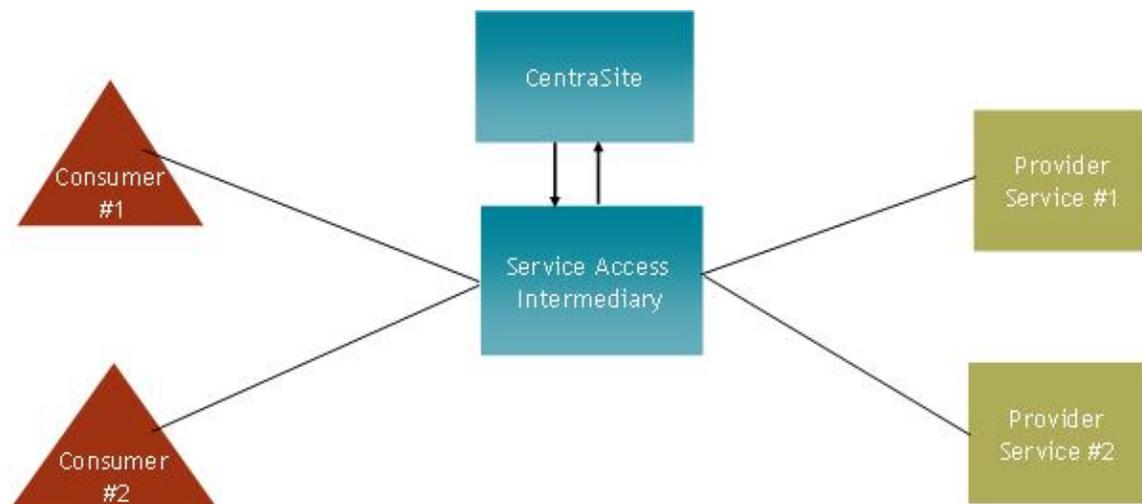

■ Introduction to Virtualized Services	30
■ Who Can Create and Manage Virtual Services?	31
■ Creating Virtual Services	32
■ Configuring SOAP-based Virtual Services	36
■ Viewing REST/XML-based Virtual Services	69
■ Viewing or Editing Virtualized Services	82
■ Creating Run-Time Policies	90
■ Consumer Applications	114
■ Deploying Virtualized Services and Consumer Applications	126

Introduction to Virtualized Services

A virtualized service is a service that runs on webMethods Mediator and acts as the consumer-facing proxy for a native service that runs elsewhere on the network. You can have a virtualized service for a SOAP-based web service, a REST service or an XML service. A virtualized service provides a layer of abstraction between the service consumer and the service provider, and promotes loose coupling by providing location, protocol and format independence between the consuming application and the provider service.

You deploy virtualized services to the webMethods Mediator policy-enforcement point. When a virtualized service is deployed, consumers access this proxy service instead of the actual native service. The virtualized service forwards the request to the appropriate back-end service and, if it has been configured to do so, performs additional mediation functions such as message transformation, protocol bridging, load balancing and failover handling.

The figure below shows webMethods Mediator (the *service access intermediary*) mediating traffic between consumers and virtualized services. Mediator provides loose coupling between consumers and providers, and is able to identify the consumers who are accessing the provider services by examining the traffic flowing through it.

A virtual service is an asset that you create and store in the **Asset Catalog**. You should virtualize each service that you want to deploy to Mediator. You can virtualize a service from scratch or make a virtual copy of an existing service, and then configure the required information in the virtual service definition (VSD) for the service.

You can create one or more virtual services for a single SOAP-based web service. For example, if you have different authentication or routing requirements for two different sets of consumers, you would create a different virtual service for each set of consumers.

The Predefined Asset Types Installed with CentraSite for Virtualization

CentraSite is installed with a predefined set of asset types for virtualization.

The following table identifies the predefined asset types for virtualization and indicates to which native asset type and CentraSite editions they belong.

Native Asset Type Name	Virtual Asset Type Name	Availability in CentraSite Control	Availability in CentraSite Business UI
Web Service	Virtual Service	✓	✓
REST Service	Virtual REST Service		✓
XML Service	Virtual XML Service		✓

This document uses the term *virtualized service* when referring to the three types of virtual services in general.

Important: *This is of specific relevance to virtual REST and XML based service assets. Beginning with version 9.7, CentraSite Control does not support the following out-of-the-box asset types: REST Service, XML Service, Virtual REST Service, and Virtual XML Service. This is because, CentraSite Control does not support the enhanced interface for REST and XML service assets (in contrast, earlier versions of CentraSite Control supported a standardized interface for REST and XML service assets). Documentation of the prior REST and XML service interface is available to Software AG customers who have a current maintenance contract in Empower, Software AG's global extranet (<http://empower.softwareag.com/>).*

Who Can Create and Manage Virtual Services?

To create and manage virtual services, you must belong to a role with the following permissions:

- Create Assets —OR— Manage Assets
- Manage Runtime Policies (required to configure virtual services)
- Mediator Publisher (required to deploy virtual services)

Note: If a user has View permission on a service and Create Assets permission within their own organization, he or she can virtualize the particular web service. However, the user will not be permitted to configure the processing steps for the service that is virtualized unless he or she also has the Manage Runtime Policies permission for their organization. Only users with Manage Runtime Policies permission can configure these steps. Consider identifying a small group of users who will be responsible for configuring the processing steps for a service, and give this group a role that includes the Manage Runtime Policies permission. Because these users might configure virtualized services that other users have created, they will also need Modify permission on the actual virtualized services. To ensure that these users have access to the virtualized services that they need to configure, consider creating a design/change-time policy that automatically gives this group of users Modify permission on a service when it is virtualized.

For more information about roles and permissions, see *Getting Started with CentraSite*.

Creating Virtual Services

Generally speaking, you should ensure that the following conditions are satisfied before you create a virtual service:

- Ensure that the interface for the native service is completely implemented and that interface is reflected in the WSDL or schema file that is registered for the service in the CentraSite registry.
- An instance of the service is deployed and running at a known point in network.
- The metadata for the native service is valid and up-to-date. If the metadata for the native service has not been completely specified or is out-of-date, you should update it before you generate the virtual service so that you do not carry inaccurate/incomplete data into the virtual service.
- *This is of specific relevance to virtual REST and XML based service assets.* Beginning with version 9.7, CentraSite Control does not support the following out-of-the-box asset types: REST Service, XML Service, Virtual REST Service, and Virtual XML Service. This is because, CentraSite Control does not support the enhanced interface for REST and XML service assets (in contrast, earlier versions of CentraSite Control supported a standardized interface for REST and XML service assets). Documentation of the prior REST and XML service interface is available to Software AG customers who have a current maintenance contract in Empower, Software AG's global extranet (<http://empower.softwareag.com/>).

Therefore, you cannot create virtual instances of the asset types REST Service and XML Service using the CentraSite Control user interface. Instead, you can create them by using the CentraSite Business UI.

There are two ways to virtualize a service in CentraSite Control.

Creating a Virtual Service from Scratch

You can create a web service *from scratch*, meaning you manually create the virtual service and set its attributes.

To create a virtual service from scratch

1. In CentraSite Control, go to **Asset Catalog > Browse**.
2. Click the **Add Asset** button.
3. In the **Add Asset** dialog, specify the following attributes:

In this field...	Do the following...
Type	Choose the Virtual Service asset type.
Name	<p>A name for the new virtual service. Unlike native services, the names of virtual services cannot contain spaces or special characters (except <code>_</code> and <code>-</code>). Consequently, if you adopt a convention that involves using the name of the service as part of the virtual service name, then the names of the services themselves must not contain characters that are invalid in virtual service names.</p> <p>If you want to change the name of a virtual service later, make sure the service is undeployed, and then change the name in the service's detail page.</p>
Description	<i>Optional.</i> A description for the virtual service. This description appears when a user displays a list of virtual services in the user interface.
Organization	Specify the organization to which this virtual service will be added.

Note: The **Organization** list contains the names of all organizations for which you have `Manage Assets` permission.

If you select an organization other than your own organization, you will nevertheless be the owner of the virtual service.

Note: Choose the organization with care. You cannot change the organization assignment after the virtual service is added to the catalog. You can, however, export a virtual service from one organization and import it to another.

- Click **OK**. The virtual service is added to the **Asset Catalog**. The asset's details page is displayed.

Important: During virtualization of an asset, CentraSite will not allow you to add the virtual asset to the asset catalog unless you have specified all "required" attributes in the asset's type definition and all referenced objects to which the asset has an association. The value for the "required" attribute and referenced object must be specified in the virtual service's profile in order to add the asset to the asset catalog.

- View or edit the virtual service's profiles as described in "[Virtualized Services in CentraSite](#)" on page 29.
- Configure the virtual service's processing steps as described in "[Creating Virtual Services](#)" on page 32

Virtualizing an Existing Service

You use the **Virtualize** option to virtualize an existing web service in CentraSite Control.

To virtualize an existing service

- In CentraSite Control, display the service for that you want to create a virtual copy. For procedures, see *CentraSite User's Guide*.
- On the asset detail page, click **Actions** and then select **Virtualize**.

Important: Be aware that CentraSite will not allow you to virtualize a service if it does not contain an associated WSDL or schema file in the registry.

- In the **Virtualize <name of the type> Service** wizard, specify the following fields:

In this field...	Specify...
Name	A name for the new virtual service. Unlike services, the names of virtual services cannot contain spaces or special characters (except _ and -). Consequently, if you adopt a convention that involves using the name of the service as part of the virtual service name, then the names of the services themselves must not contain characters that are invalid in virtual service names. If you want to change the name of a virtual service later, make sure the service is undeployed, and then change the name in the service's detail page.
Description	<i>Optional.</i> A description for the virtual service. This description appears when a user displays a list of virtual services in the user interface.

In this field...	Specify...
Organization	<p data-bbox="558 321 1421 394">Specify the organization to which this virtual service will be added.</p> <div data-bbox="558 411 1421 541" style="background-color: #f0f0f0; padding: 5px;"> <p data-bbox="573 426 1308 527">Note: The Organization list contains the names of all organizations for which you have <code>Manage Assets</code> permission.</p> </div> <p data-bbox="558 562 1421 636">If you select an organization other than your own organization, you will nevertheless be the owner of the virtual service.</p> <div data-bbox="558 653 1421 814" style="background-color: #f0f0f0; padding: 5px;"> <p data-bbox="573 667 1406 800">Note: Choose the organization with care. You cannot change the organization assignment after the virtual service is added to the catalog. You can, however, export a virtual service from one organization and import it to another.</p> </div>
Version	<p data-bbox="558 842 1421 1083"><i>Optional.</i> A version identifier for the virtual service. The version identifier is an optional attribute that you can increment when a service is modified to indicate that the service has been updated. You can use any versioning scheme you choose. The version identifier does not need to be numeric. This is the "public" version identifier that CentraSite Control shows to users when it displays the list of services. Examples:</p> <div data-bbox="558 1100 1421 1203" style="background-color: #f0f0f0; padding: 5px;"> <pre data-bbox="573 1100 805 1203">0.0a 1.0.0 (beta) Pre-release 001 V1-2007.04.30</pre> </div> <p data-bbox="558 1224 1421 1255">You can later create new versions of the virtual service.</p> <p data-bbox="558 1276 1421 1444">In addition, CentraSite automatically generates a system version number, which is visible on the virtual service detail page. The system version number is independent from the version number you specify here. For more information, see the <i>CentraSite User's Guide</i>.</p>
Create a Run-Time Policy	<p data-bbox="558 1486 1421 1728">Use this checkbox to specify the behavior for the run-time policy (or policies) associated with the virtual service. If you select the checkbox, the run-time policy or policies associated with the virtual service will be created automatically when the service is virtual. If you do not select the checkbox, the run-time policy or policies will not be created when the service is virtual.</p> <p data-bbox="558 1749 1421 1848">You can only select the checkbox if you have the <code>Manage Runtime Policies</code> organization-level permission; without this permission, the checkbox is deactivated.</p>

4. If you have attributes specified in the service for virtualizing, click **Next** to go to the attribute mapping dialog.
5. In the **Attributes** dialog, choose the attributes of the service that you want to copy to the virtual service.

Note: Keep the following in mind:

- If you choose a parent attribute, by default *all* its child attributes are copied as well. You can de-select any child attribute.
- Similarly, if you de-select a parent attribute, all its child attributes are de-selected as well.
- Attributes defined as **required** in the asset's type definition and all referenced objects to which the asset has an association will be internally copied from the asset to the virtual service. These attributes will remain selected and disabled by default in the attribute mapping dialog.

6. Click **Finish**.

The virtual service is created in the **Asset Catalog** and its detail page is displayed. The WSDL interface and the entry/exit protocol (e.g., HTTP, HTTPS or JMS) will be identical to the service.

7. View or edit the virtual service's profiles as described in "[Creating Virtual Services](#)" on page 32.
8. Configure the virtual service's processing steps as described in "[Creating Virtual Services](#)" on page 32.

Restriction

Even if a Service asset type contains one or more custom profiles, a virtual service of the asset type Service will never include any of these custom profiles in the catalog.

Configuring SOAP-based Virtual Services

The CentraSite Control user interface enables you to configure the following processing steps for a SOAP-based virtual service:

The Entry Protocol Step (SOAP)

The Entry Protocol step specifies the protocol (HTTP, HTTPS or JMS) and SOAP format (1.1 or 1.2) of the requests that the virtual service will accept.

This step allows you to bridge protocols between the consuming application and the native service. For example, suppose you have a native service that is exposed over JMS and a consuming application that submits SOAP requests over HTTP. In this situation,

you can configure the virtual service's Entry Protocol step to accept HTTP requests and configure its Routing Protocols step to route the request to the Web service using JMS.

Besides using the Entry Protocol step to resolve protocol differences between the consumer and the native service, you might use this step to intentionally expose a virtual service over a particular protocol. For example, if you have a native service that is exposed over HTTP, you might expose the virtual service over JMS simply to gain the asynchronous-messaging and guaranteed-delivery benefits that one gains by using JMS as the message transport.

Use the following procedure to configure the Entry Protocol step of a virtual service.

To configure the Entry Protocol step

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see "[Viewing or Editing Virtualized Services](#)" on page 82.
2. Open the **Processing Steps** profile.
3. Select the **Entry Protocol** tab and specify the protocol (HTTP, HTTPS or JMS) for the virtual service to accept requests.

Note: CentraSite supports HTTP version 1.1 only.

In this field...	Specify...
Protocol	<p>The protocol (HTTP, HTTPS or JMS) over which the virtual service will accept requests.</p> <p>Note that you can select <i>both</i> HTTP and HTTPS if needed.</p> <div style="background-color: #f0f0f0; padding: 10px;"> <p>Important Before you deploy a service over HTTPS, ensure that the Integration Server on which the Integration Server is running has been configured for SSL. In addition, make sure you specify an HTTPS port in the Integration Server's <i>Ports Configuration</i> page. (In the Integration Server Administrator, go to Solutions > Mediator > Administration > General and specify the port in the HTTPS Ports Configuration field.) For details on the Port Configuration page, see <i>Administering webMethods Mediator</i>.)</p> </div>
JMS Provider Alias	<p>If you selected JMS, specify the Integration Server's JMS Trigger name. The alias should include the JNDI destination name and the JMS connection factory.</p>
Format	<p>The SOAP format (SOAP 1.1 or SOAP 1.2) of the requests that the virtual service will accept.</p>

The Request Processing Step (SOAP)

The Request Processing step specifies how the SOAP request message is to be transformed or pre-processed before it is submitted to the native service.

As long as a consumer sends a SOAP request to the correct virtual service endpoint, and the request includes a soapAction header, then Mediator can detect the correct service and operation; in this case, no message transformation is required. However, in some cases a virtual service might need to transform SOAP messages.

For example, you might need to accommodate differences between the message content that a consuming application is capable of submitting and the message content that a native service expects. For example, if the consuming application submits an order record using a slightly different structure than the structure expected by the native service, you can use the Request Processing step to transform the record submitted by the consuming application to the structure required by the Web service.

Specifically, you would need to configure the virtual service to:

- Transform or pre-process the request messages into the format required by the native service, before Mediator sends the requests to the native services. Additionally in this case, the transformation is required if the virtual service has a schema validation policy, which validates the requests.
- Transform or pre-process the native service's response messages into the format required by the consumer applications, before Mediator returns the responses to the consumer applications.

There are two ways to transform or pre-process a message:

- By passing the message to an XSLT transformation file.
- By passing the message to a webMethods Integration Server service.

Use the following procedure to configure the Request Processing step of a virtual service.

To configure the Request Processing step

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see "[Viewing or Editing Virtualized Services](#)" on page 82.
2. Open the **Processing Steps** profile.
3. Select the **Request Processing** tab. On this tab you can specify one or more **Transform** steps and one or more **webMethods IS Service** steps as follows.
 - a. Click **Add Step**, select one of the following kinds of request processing steps and click **OK**.

Request Processing Step	Description
Transform	<p>Configure this step if you want to perform an XSLT message transformation on the request message before it is submitted to the native service.</p> <div data-bbox="771 478 1463 884" style="background-color: #f0f0f0; padding: 10px;"> <p>Important The XSL file uploaded by the user should <i>not</i> contain the XML declaration in it (e.g., <code><?xml version="1.0" encoding="UTF-8"></code>). This is because when the virtual service is deployed to Mediator, Mediator embeds the XSL file in the virtual service definition (VSD), and since the VSD itself is in XML format, there cannot be an XML declaration line in the middle of it. This can lead to unexpected deployment issues which can be avoided by making sure the XSL file does not contain the declaration line.</p> </div>
webMethods IS Service	<p>Configure this step if you want to invoke a webMethods IS service to preprocess the request before it is submitted to the native service. For more information, see "Invoking webMethods IS Services in Virtual Services" on page 247.</p>

- b. In the **Step** list, click the step (**Transform** or **webMethods IS Service**) and complete the appropriate dialog box as follows.

For this step...	Do the following...
Transform	<p>Click Browse and select the XSLT transformation file from your file system and click OK.</p> <div data-bbox="688 1402 1459 1499" style="background-color: #f0f0f0; padding: 10px;"> <p>Note: If you make changes to the XSLT file in the future, you must re-deploy the virtual service.</p> </div>
webMethods IS Service	<p>Type the fully qualified service name or, to display a list of webMethods IS services that are published to CentraSite, type a keyword phrase in the Service field. The wildcard character * is supported. For example, to return all IS services that start with <code>Test</code>, type <code>Test*</code>. (The list that appears also identifies the application server instance on which each service is located.) Then select one or more services to be used to manipulate the request (the axis2 MessageContext instance) and click OK.</p>

For this step...**Do the following...**

Mediator will pass to the invoked IS service the request message context (the axis2 MessageContext instance), which contains the request-specific information. Thus, you can use the public IS services that accept MessageContext as input to manipulate the response contents. For more information, see ["Invoking webMethods IS Services in Virtual Services" on page 247](#).

Note: The webMethods IS service must be running on the same Integration Server as Mediator.

- c. Configure additional request processing steps if desired, and click **Save**.

Note: Specify the steps in the order in which they should be invoked. Use the arrow buttons to rearrange the sequence of steps. To delete a step, select the check box next to the step and click **Delete**.

The Response Processing Step (SOAP)

The Response Processing step is similar to the Request Processing step. This step specifies how the response message from the native service provider is to be transformed or processed before it is returned to the consuming application.

You may configure and test a virtual service without specifying response processing. You can go back later and specify response processing, if desired.

All steps are optional. You can configure the following steps:

- **Error Messaging:** Configure this step to return a custom error message (and/or the native provider's service fault content) to the consuming application when the native provider returns a service fault. In addition, you can invoke one or more webMethods IS services to process the error message before and/or after the custom error message is added to the response.
- **Transformation:** Configure this step to perform message transformations using a specified XSLT file.
- **webMethods IS Service:** Invoke a user-defined ["webMethods IS service" on page 259](#) that processes the response message.

Use the following procedure to configure the Response Processing step of a virtual service.

To configure the Response Processing step

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services"](#) on page 82.
2. Open the **Processing Steps** profile.
3. Select the **Response Processing** tab.
4. Click **Add Step**, select one of the following steps and click **OK**.

You can select only one step at a time, but you can go back and select one or more **Transform** steps, one or more **webMethods IS Service** steps, but only one **Error Messaging** step.

Step	Description
Error Messaging	<p>You use this step to configure error responses for this particular virtual service. Alternatively, you can configure global error responses for <i>all</i> virtual services, using <i>Mediator's Service Fault Configuration</i> page, as described in <i>Administering webMethods Mediator</i>.</p> <p>The precedence of the Error Messaging instructions is as follows:</p> <ul style="list-style-type: none"> ■ If you configure an Error Messaging step for a virtual service, the error messaging step takes precedence over any settings on the global <i>Service Fault Configuration</i> page. ■ If you do not create an Error Messaging step for a virtual service, the settings on the <i>Service Fault Configuration</i> page take precedence.
Transform	<p>Configure this step if you want to invoke an XSLT transformation file to transform the SOAP response payloads from XML format to the format required by the consumer.</p>
webMethods IS Service	<p>Configure this step if you want to invoke a webMethods IS service to process the response message from the native service before it is returned to the consuming application. For more information, see "Invoking webMethods IS Services in Virtual Services" on page 247.</p>

5. If you selected **Error Messaging** above, click **Error Messaging** in the **Step** list and configure it as follows.

You use this step to configure error responses for this particular virtual service. Select one or both of the following options:

Send Native Provider Fault: When you select this option, Mediator returns the native service provider's fault content (if available) to the consuming application. Mediator will send whatever content it received from the native service provider. If you select this option, the **Response** option is ignored when a fault is returned by the native service provider. (Faults returned by internal Mediator exceptions will still be handled by the **Response** option.)

Response: When you select this option, Mediator returns the following fault response to the consuming application:

```
Mediator encountered an error:$ERROR_MESSAGE while executing
operation:$OPERATION service:$SERVICE at time:$TIME on date:$DATE.
The client ip was:$CLIENT_IP. The current user:$USER. The consumer
application:$CONSUMER_APPLICATION".
```

This fault response is returned in both of the following cases:

- When a fault is returned by the native service provider.

In this case, the `$ERROR_MESSAGE` variable in the fault response will contain the message produced by the provider's exception that caused the error. This is equivalent to the `getMessage` call on the Java Exception. This maps to the [faultString](#) element for SOAP 1.1 or the [Reason](#) element for SOAP 1.2 catch. Mediator discards the native service provider's fault and does not return this content to the web service caller since it could be considered a security issue, especially if the native provider is returning a stack trace with its response.
- When a fault is returned by internal Mediator exceptions (such as policy violation errors, timeouts, etc.).

In this case, `$ERROR_MESSAGE` will contain the error message generated by Mediator.

The default fault response contains predefined fault handler variables (`$ERROR_MESSAGE`, `$OPERATION`, etc.) which are described in the table below.

You can customize the default fault response using the following substitution variables, where Mediator replaces the variable reference with the real content at run time:

- The predefined context variables listed in "[The Predefined Context Variables](#)" on page 260.
- Custom context variables that you declare using Mediator's API (see "[The API for Context Variables](#)" on page 265).

Note: If you want to reference a custom context variable that you have already defined in a context-based routing rule (as opposed to one you have declared using the Mediator API), you must add the prefix `$mx` to the variable name in order to reference the variable. For example, if you defined the variable `TAXID`, you would reference it as `$mx:TAXID`.

The fault handler variables are described below.

Note: If no value is defined for a fault handler variable, then the returned value will be the literal string "null". For example, `$CONSUMER_APPLICATION` will always be "null" if the service's policy does not contain the Identify Consumer action.

Fault Handler Variable	Description
<code>\$ERROR_MESSAGE</code>	The error message produced by the exception that is causing the error. This is equivalent to the <code>getMessage</code> call on the Java Exception. This maps to the <code>faultString</code> element for SOAP 1.1 or the <code>Reason</code> element for SOAP 1.2 catch.
<code>\$OPERATION</code>	The operation that was invoked when this error occurred.
<code>\$SERVICE</code>	The service that was invoked when this error occurred.
<code>\$TIME</code>	The date (as determined on the Container side) at which the error occurred.
<code>\$DATE</code>	The date (as determined on the Container side) at which the error occurred.
<code>\$CLIENT_IP</code>	The IP address of the client invoking the service. This might be available for only certain invoking protocols, such as HTTP(S).
<code>\$USER</code>	The currently authenticated user. The user will be present only if the Transport/SOAP Message have user credentials.
<code>\$CONSUMER_APPLICATION</code>	The currently identified consumer application.

Pre-Processing: Optional. Configure this step if you want to invoke one or more `webMethods IS` services to manipulate the response message before the **Error Messaging** step is invoked. The IS service will have access to the response message context (the `axis2 MessageContext` instance) before it is updated with the custom error message. For example, you might want to send emails or perform custom alerts based on the response payload. For more information, see ["Invoking webMethods IS Services in Virtual Services" on page 247](#).

Post-Processing: Optional. Configure this step if you want to invoke one or more webMethods IS services to manipulate the service fault after the **Error Messaging** step is invoked. The IS service will have access to the entire service fault and the custom error message. You can make further changes to the fault message structure, if needed. For more information, see ["Invoking webMethods IS Services in Virtual Services" on page 247](#).

6. If you selected **Transform** above, click **Transform** in the **Step** list, click **Browse** and select the XSLT transformation file from your file system, then click **OK**. If you make changes to the XSLT file in the future, you must re-deploy the virtual service.
7. If you selected **webMethods IS Service** above, click **webMethods IS Service** in the **Step** list and configure it as follows.

Type the fully qualified service name or, to display a list of webMethods IS services that are published to CentraSite, type a keyword phrase in the **Service** field. The wildcard character * is supported. For example, to return all IS services that start with `Test`, type `Test*`. (The list that appears also identifies the application server instance on which each service is located.) Then select one or more services to be used to manipulate the response (the axis2 MessageContext instance) and click **OK**.

Mediator will pass to the invoked IS service the response message context (the axis2 MessageContext instance), which contains the response-specific information. Thus, you can use the public IS services that accept MessageContext as input to manipulate the response contents. For more information, see ["Invoking webMethods IS Services in Virtual Services" on page 247](#).

Note: The webMethods IS service must be running on the same Integration Server as Mediator.

8. Configure additional response processing steps if desired, and click **Save**.
Arrange the steps in the order in which they should be invoked. Use the arrow buttons to rearrange the sequence of steps. To delete a step, select the check box next to the step and click **Delete**.

The Routing Protocols Step (SOAP)

You can choose to configure one of the following routing protocols for a SOAP-based virtual service.

“Straight Through” Routing (SOAP)

If your Entry Protocol is HTTP or HTTPS, you can choose to use the “Straight Through” routing protocol. (Alternatively, you can choose “Content-based”, “Context-based” or “Load Balancing” routing.)

When you select the “Straight Through” routing protocol, the virtual service will route the requests directly to the native service endpoint you specify. You may specify how to authenticate requests (as with all routing protocols).

Alternatively, you can choose the “Content-Based”, “Context-Based” or “Load Balancing” routing protocol.

To configure “Straight Through” routing

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see [“Viewing or Editing Virtualized Services” on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab, specify the following fields, and click **Save**.

Field	Description
HTTP or JMS	Select HTTP .
Routing Type	Select Straight Through
Default To	<p>Click the Endpoint button and select the URL of the native service to route the request to.</p> <p>Alternatively, Mediator offers “Local Optimization” capability if the native service and the virtual service (in Mediator) are located on the same machine. With local optimization, service invocation happens in-memory and not through a network hop. In the Default To field, specify the native service in either of the following forms:</p> <pre>local://<service_full_path></pre> <p>OR</p> <pre>local://<server>:<port>/ws/<service_full_path></pre> <p>For example:</p> <pre>local://MediatorTestServices:NewMediatorTestServices_Port</pre> <p>which points to the endpoint service NewMediatorTestServices_Port which is present under the folder MediatorTestServices in Integration Server. This works for HTTP endpoints only, for all types of Routing Protocols.</p>
Configure Endpoint Properties icon	<p>This icon displays a dialog box that enables you to configure a set of properties for the endpoint as follows:</p> <ul style="list-style-type: none"> ■ SOAP Optimization Method: Optional. Mediator can accept the following optimization methods to optimize the payloads of SOAP requests: <ul style="list-style-type: none"> ■ MTOM: Indicates that Mediator expects to receive a request with a Message Transmission Optimization Mechanism

Field	Description
	<p>(MTOM) attachment, and will forward the attachment to the native service.</p> <ul style="list-style-type: none"> ■ SwA: Indicates that Mediator expects to receive a “SOAP with Attachment” (SwA) request, and will forward the attachment to the native service. ■ None (the default). <ul style="list-style-type: none"> i. Bridging between SwA and MTOM is not supported. If a consumer sends an SwA request, Mediator can only forward SwA to the native provider. The same is true for MTOM, and applies to responses received from the native provider. That is, an SwA or MTOM response received by Mediator from a native provider will be forwarded to the caller using the same format it received. ii. When sending SOAP requests that do <i>not</i> contain a MTOM or SWA attachment to a virtual service for a native provider endpoint that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related' (or the virtual service's Request Processing Step should include an "IS service callout" on page 247 that sets the BUILDER_TYPE context variable to 'multipart/related'). This is necessary so Mediator knows how to parse the response properly. ■ WSS Header Customization: Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native service. <ul style="list-style-type: none"> ■ Pass all security headers: Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the virtual service's security run-time policy). <div data-bbox="610 1423 1414 1591" style="background-color: #f0f0f0; padding: 10px; margin: 10px 0;"> <p>Note: If the virtual service does not contain a security run-time policy, and the <code>mustUnderstand</code> attribute of the security header is 0/false, then Mediator will <i>always</i> forward the security header to the native service.</p> </div> ■ Remove processed security header from request before routing: Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the virtual service's security run-time policy). Note that Mediator will <i>not</i> remove the security header if <i>both</i> of the following conditions are true: 1) Mediator did not process the security header, and 2) the <code>mustUnderstand</code> attribute of the security header is 0/false).

Field	Description
	<ul style="list-style-type: none"> <li data-bbox="516 323 1398 562">■ HTTP Connection Timeout: The time interval (in seconds) after which a connection attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.connectionTimeout</code> located in the file <code>Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties</code> . The default of that property is 30 seconds. <li data-bbox="516 583 1398 823">■ Read Timeout: The time interval (in seconds) after which a socket read attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.readTimeout</code> located in the file <code>Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties</code> . The default of that property is 30 seconds. <li data-bbox="516 865 1398 1003">■ SSL Options: To enable SSL client authentication for the endpoint, you must specify values for both the Client Certificate Alias field and the IS Keystore Alias field. If you specify a value for only one of these fields, a deployment error will occur. <div data-bbox="565 1024 1398 1119" style="background-color: #f0f0f0; padding: 5px;"> <p>Note: SSL client authentication is optional; you may leave both fields blank.</p> </div> <ul style="list-style-type: none"> <li data-bbox="565 1140 1398 1486">■ Client Certificate Alias: The client's private key to be used for performing SSL client authentication. If you specify a client certificate alias, you must also include in the virtual service's policy the "Require SSL" action and select that action's "Client Certificate Required" option. The "Client Certificate Required" option specifies whether client certificates are required for the purposes of: 1) Verifying the signature of signed SOAP requests or decrypting encrypted SOAP requests, and 2) Signing SOAP responses or encrypting SOAP responses. <li data-bbox="565 1507 1398 1640">■ IS Keystore Alias: The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) will be used for performing SSL client authentication.
HTTP Authentication	<p>Authentication Scheme: Specify the mode of authentication: Basic Authentication (default), NTLM, OAuth2 or None.</p> <p>Basic Authentication. Select one of the following options:</p> <ul style="list-style-type: none"> <li data-bbox="516 1850 1398 1911">■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header.

Field	Description
	<p>Mediator passes the “Authorization” header present in the original client request to the native service.</p>
	<ul style="list-style-type: none"> ■ Use specified credentials: Authenticates requests according to the values you specify in the User, Password and Domain fields.
	<p>NTLM. Note that if Mediator is used to access a native service protected by NTLM (which is typically hosted in IIS), then the native service in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as “Windows”, then “NTLM” should be in its list. The “Negotiate” handshake will be supported in the near future. This note applies to all three of the following options for NTLM:</p>
	<ul style="list-style-type: none"> ■ Use credentials from incoming request: Default. Mediator uses the user credentials passed in the request header for an NTLM handshake with the server.
	<ul style="list-style-type: none"> ■ Use specified credentials: Mediator uses the values you specify in the User, Password and Domain fields for an NTLM handshake with the server.
	<ul style="list-style-type: none"> ■ Transparent: If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>false</code> (the default), then Mediator will behave in “pass by” mode, allowing an NTLM handshake to occur between the client and server. If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>true</code>, then Mediator performs the Kerberos Windows authentication (and not NTLM Windows authentication). This property is located in <code>Integration Server_directory \instances \instance_name \config \server.cnf</code>. Note: If the client is a WCF application, then the client should be configured with <code>clientCredentialType</code> set to NTLM.
	<p>OAuth2. Select one of the following options:</p>
	<ul style="list-style-type: none"> ■ Use credentials from incoming request: Default. This is known as “pass through” mode, in which the consumer includes an OAuth2 access token (a “Bearer” type token) in the request. Mediator then passes the access token unchanged to the native OAuth server.
	<ul style="list-style-type: none"> ■ Use specified token: In this mode, the consumer does not include an OAuth2 access token in the request. Instead, the provider generates an OAuth2 access token for each consumer, and Mediator stores the access tokens in Passman. When consumers send requests, Mediator obtains the OAuth2 access tokens from Passman and uses them to access the native services. Specify an OAuth access token to be deployed by Mediator. If you select this option, the consumer need not pass the OAuth token during service invocation. Click the Show Token button to view the OAuth

Field	Description
	<p>access token. Users who do not have the permissions to create and manage virtual services will not see this button.</p> <p>Specify an OAuth access token to be deployed by Mediator by clicking the Show Token button and selecting an OAuth access token. Users who do not have the permissions to create and manage virtual services will not see this button. For more information, see "Who Can Create and Manage Virtual Services?" on page 31.</p> <p>Note: Keep the following in mind:</p> <ul style="list-style-type: none"> ■ You must set the Integration Server property <code>watt.server.auth.skipForMediator</code> to "true" and then restart Integration Server for the change to take effect. This property is located in the server configuration file (<code>server.cnf</code>), which is located in the <i>Integration Server_directory \config</i> directory. For details, see the <i>webMethods Integration Server Administrator's Guide</i>. ■ The run-time actions "Require HTTP Basic Authentication" and "Identify Consumer" (with the value HTTP Authentication Token as the identifier) will not be enforced when using the authentication scheme OAuth2. <p>None. Select the following option:</p> <ul style="list-style-type: none"> ■ Invoke Service Anonymously: Does not authenticate requests.
HTTP Headers	<p>The HTTP headers that you want to use to authenticate the requests.</p> <ul style="list-style-type: none"> ■ Use Existing: Use the HTTP headers that are contained in the requests. ■ Customize: Use the HTTP headers that you specify in the Name and Value columns below. If you need to specify multiple headers, use the plus button to add rows.

"Content-based" Routing (SOAP)

If your Entry Protocol is HTTP or HTTPS, you can choose to use the "Content-based" routing protocol. (Alternatively, you can choose "Straight Through", "Context-based" or "Load Balancing" routing.)

If you have a native service that is hosted at two or more endpoints, you can use the "Content-Based" routing protocol to route specific types of messages to specific endpoints.

You can route messages to different endpoints based on specific values that appear in the request message. You might use this capability, for example, to determine which operation the consuming application has requested, and route requests for complex operations to an endpoint on a fast machine.

The requests are routed according to the content-based routing rules you create. That is, they are routed based on the successful evaluation of one or more XPath expressions that are constructed utilizing the content of the request payload. For example, a routing rule might allow requests for half of the methods of a particular service to be routed to Service A, and the remaining methods to be routed to Service B.

You may also specify how to authenticate requests (as with all routing protocols).

If a SOAP request contains a WS-Security header, Mediator passes it to the native service.

To configure “Content-Based” routing

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see [“Viewing or Editing Virtualized Services” on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab, specify the following fields and click **Save**.

Field	Description
HTTP or JMS	Select HTTP .
Routing Type	Select Content Based .
Routing Rules	For instructions for creating a routing rule, see “Creating a Routing Rule for “Content-based” Routing (SOAP)” on page 53 .
Default To	<p>A native service endpoint to route the request to in case all routing rules evaluate to False. Click the Endpoint button and select the URL of the native service to route the request to.</p> <p>Alternatively, Mediator offers “Local Optimization” capability if the native service and the virtual service (in Mediator) are located on the same machine. With local optimization, service invocation happens in-memory and not through a network hop. In the Default To field, specify the native service in either of the following forms:</p> <pre>local://<service_full_path></pre> <p>OR</p> <pre>local://<server>:<port>/ws/<service_full_path></pre> <p>For example:</p>

Field	Description
	<p><code>local://MediatorTestServices:NewMediatorTestServices_Port</code></p> <p>which points to the endpoint service <code>NewMediatorTestServices_Port</code> which is present under the folder <code>MediatorTestServices</code> in Integration Server. This works for HTTP endpoints only, for all types of Routing Protocols.</p>
HTTP Authentication	<p>Authentication Scheme: Specify the mode of authentication: Basic Authentication (default), NTLM, OAuth2 or None.</p> <p>Basic Authentication. Select one of the following options:</p> <ul style="list-style-type: none"> ■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header. Mediator passes the “Authorization” header present in the original client request to the native service. ■ Use specified credentials: Authenticates requests according to the values you specify in the User, Password and Domain fields. <p>NTLM. 	<ul style="list-style-type: none"> ■ Customize: Use the HTTP headers that you specify in the Name and Value columns below. If you need to specify multiple headers, use the plus button to add rows.

Creating a Routing Rule for “Content-based” Routing (SOAP)

To create a routing rule

1. Click the **Endpoint** button (next to the **Route To** column).
2. In the **Search for Endpoint** dialog that appears, click the **Search** button to search for the Web service endpoint to route the requests to.
3. Then select a service and click **OK**.
4. Click the **Configure Endpoint Properties** icon (next to the **Endpoint** button) if you want to configure a set of properties for each endpoint individually. In the dialog box, click the endpoint you want to configure and specify the following fields:

Field	Description
SOAP Optimization Method	<p>Optional. Mediator can accept the following optimization methods to optimize the payloads of SOAP requests:</p> <ul style="list-style-type: none"> ■ MTOM: Indicates that Mediator expects to receive a request with a Message Transmission Optimization Mechanism (MTOM) attachment, and will forward the attachment to the native service. ■ SwA: Indicates that Mediator expects to receive a “SOAP with Attachment” (SwA) request, and will forward the attachment to the native service. ■ None (the default). <ul style="list-style-type: none"> a. Bridging between SwA and MTOM is not supported. If a consumer sends an SwA request, Mediator can only forward SwA to the native provider. The same is true for MTOM, and applies to responses received from the native provider. That is, an SwA or MTOM response received by Mediator from a native provider will be forwarded to the caller using the same format it received. b. When sending SOAP requests that do <i>not</i> contain a MTOM or SWA attachment to a virtual service for a native provider endpoint that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related' (or the virtual service's Request Processing Step should include an "IS service callout" on page 247 that sets the BUILDER_TYPE context

Field	Description
	variable to 'multipart/related'). This is necessary so Mediator knows how to parse the response properly.
WSS Header Customization	<p data-bbox="548 415 1398 489">Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native service.</p> <ul style="list-style-type: none"> <li data-bbox="548 510 1398 646">■ Pass all security headers: Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the virtual service's security run-time policy). <div data-bbox="613 667 1398 825" style="background-color: #f0f0f0; padding: 5px;"> <p data-bbox="613 667 1398 825">Note: If the virtual service does not contain a security run-time policy, and the <code>mustUnderstand</code> attribute of the security header is <code>0/false</code>, then Mediator will <i>always</i> forward the security header to the native service.</p> </div> <ul style="list-style-type: none"> <li data-bbox="548 846 1398 1119">■ Remove processed security header from request before routing: Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the virtual service's security run-time policy). Note that Mediator will <i>not</i> remove the security header if <i>both</i> of the following conditions are true: 1) Mediator did not process the security header, and 2) the <code>mustUnderstand</code> attribute of the security header is <code>0/false</code>).
HTTP Connection Timeout	<p data-bbox="548 1161 1398 1371">The time interval (in seconds) after which a connection attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.connectionTimeout</code> located in the file <code>Integration Server_directory \packages\WmMediator\config\resources\pg-config.properties</code>. The default of that property is 30 seconds.</p>
Read Timeout	<p data-bbox="548 1413 1398 1623">The time interval (in seconds) after which a socket read attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.readTimeout</code> located in the file <code>Integration Server_directory \packages\WmMediator\config\resources\pg-config.properties</code>. The default of that property is 30 seconds.</p>
SSL Options	<p data-bbox="548 1665 1398 1801">To enable SSL client authentication for the endpoint, you must specify values for both the Client Certificate Alias field and the IS Keystore Alias field. If you specify a value for only one of these fields, a deployment error will occur.</p> <div data-bbox="565 1822 1398 1904" style="background-color: #f0f0f0; padding: 5px;"> <p data-bbox="565 1822 1398 1904">Note: SSL client authentication is optional; you may leave both fields blank.</p> </div>

Field	Description
	<ul style="list-style-type: none"> <li data-bbox="548 323 1411 632">■ Client Certificate Alias: The client's private key to be used for performing SSL client authentication. If you specify a client certificate alias, you must also include in the virtual service's policy the "Require SSL" action and select that action's "Client Certificate Required" option. The "Client Certificate Required" option specifies whether client certificates are required for the purposes of: 1) Verifying the signature of signed SOAP requests or decrypting encrypted SOAP requests, and 2) Signing SOAP responses or encrypting SOAP responses. <li data-bbox="548 653 1411 789">■ IS Keystore Alias: The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) will be used for performing SSL client authentication.

To create an XPath expression for the routing rule, do the following:

1. Click the **Edit** button (next to the **If True** column).
2. In the XPath Editor that appears, view the **Namespace Map** tab, which displays all predefined namespaces (e.g., soapenv, soapenc, etc.). If you want to add custom namespaces, click **Add Custom Namespace/prefix**, specify a name and value for the namespace and click **OK**. If you need to add additional rows, use the plus button.
3. In the XPath Editor's **All Nodes** tab, expand the namespace's node, choose the method you want for the XPath expression, and click **OK**.
4. In the XPath Editor's **XPATH Evaluator** tab, evaluate the XPath expression by specifying an argument in the **XPath Expression** field, and then click **Evaluate**.
5. After you have evaluated the XPath expression, click **OK**.

“Context-based” Routing (SOAP)

If your Entry Protocol is HTTP or HTTPS, you can choose to use the “Context-based” routing protocol. (Alternatively, you can choose “Straight Through”, “Content-based” or “Load Balancing” routing.)

If you have a native service that is hosted at two or more endpoints, you can use the Context-Based protocol to route specific types of messages to specific endpoints.

The requests are routed according to the context-based routing rules you create. A routing rule specifies where requests should be routed, and the criteria by which they should be routed there. For example, requests can be routed according to certain consumers, certain dates/times, or according to requests that exceed/fall below a specified metric (Total Count, Success Count, Fault Count, etc.). You can create one or more rules.

You may also specify how to authenticate requests (as with all routing protocols).

If a SOAP request contains a WS-Security header, Mediator passes it to the native service.

To configure “Context-Based” Routing

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services" on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab, specify the following fields, and click **Save**.

Field	Description
HTTP or JMS	Select HTTP .
Routing Type	Select Context Based .
Routing Rules	To create a routing rule, click the Add Rule button and complete the Add Routing Rule dialog box. For instructions, see "Creating a Routing Rule for “Context-based” Routing (SOAP)" on page 59 .
Route To	<p>A native service endpoint to route the request to in case all routing rules evaluate to False. Click the Endpoint button and select the URL of the native service to route the request to. To specify additional services, use the plus button next to the field to add rows.</p> <p>Alternatively, Mediator offers “Local Optimization” capability if the native service and the virtual service (in Mediator) are located on the same machine. With local optimization, service invocation happens in-memory and not through a network hop. In the Default To field, specify the native service in either of the following forms:</p> <pre>local://<service_full_path></pre> <p>OR</p> <pre>local://<server>:<port>/ws/<service_full_path></pre> <p>For example:</p> <pre>local://MediatorTestServices:NewMediatorTestServices_Port</pre> <p>which points to the endpoint service <code>NewMediatorTestServices_Port</code> which is present under the folder <code>MediatorTestServices</code> in Integration Server. This works for HTTP endpoints only, for all types of Routing Protocols.</p>

Field	Description
HTTP Authentication	<p data-bbox="548 327 1398 390">Authentication Scheme: Specify the mode of authentication: Basic Authentication (default), NTLM, OAuth2 or None.</p> <p data-bbox="548 415 1398 447">Basic Authentication. Select one of the following options:</p> <ul data-bbox="548 472 1398 688" style="list-style-type: none"> <li data-bbox="548 472 1398 604">■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header. Mediator passes the “Authorization” header present in the original client request to the native service. <li data-bbox="548 625 1398 688">■ Use specified credentials: Authenticates requests according to the values you specify in the User, Password and Domain fields. <p data-bbox="548 735 1398 972">NTLM. Note that if Mediator is used to access a native service protected by NTLM (which is typically hosted in IIS), then the native service in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as “Windows”, then “NTLM” should be in its list. The “Negotiate” handshake will be supported in the near future. This note applies to all three of the following options for NTLM:</p> <ul data-bbox="548 997 1398 1612" style="list-style-type: none"> <li data-bbox="548 997 1398 1098">■ Use credentials from incoming request: Default. Mediator uses the user credentials passed in the request header for an NTLM handshake with the server. <li data-bbox="548 1119 1398 1220">■ Use specified credentials: Mediator uses the values you specify in the User, Password and Domain fields for an NTLM handshake with the server. <li data-bbox="548 1241 1398 1612">■ Transparent: If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>false</code> (the default), then Mediator will behave in “pass by” mode, allowing an NTLM handshake to occur between the client and server. If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>true</code>, then Mediator performs the Kerberos Windows authentication (and not NTLM Windows authentication). This property is located in <code>Integration Server_directory \instances \instance_name \config \server.cnf</code>. Note: If the client is a WCF application, then the client should be configured with <code>clientCredentialType</code> set to NTLM. <p data-bbox="548 1659 1398 1690">OAuth2. Select one of the following options:</p> <ul data-bbox="548 1715 1398 1877" style="list-style-type: none"> <li data-bbox="548 1715 1398 1877">■ Use credentials from incoming request: Default. This is known as “pass through” mode, in which the consumer includes an OAuth2 access token (a “Bearer” type token) in the request. Mediator then passes the access token unchanged to the native OAuth server.

Field	Description
	<ul style="list-style-type: none"> ■ Use specified token: In this mode, the consumer does not include an OAuth2 access token in the request. Instead, the provider generates an OAuth2 access token for each consumer, and Mediator stores the access tokens in Passman. When consumers send requests, Mediator obtains the OAuth2 access tokens from Passman and uses them to access the native services. Specify an OAuth access token to be deployed by Mediator. If you select this option, the consumer need not pass the OAuth token during service invocation. Click the Show Token button to view the OAuth access token. Users who do not have the permissions to create and manage virtual services will not see this button. <p>Specify an OAuth access token to be deployed by Mediator by clicking the Show Token button and selecting an OAuth access token. Users who do not have the permissions to create and manage virtual services will not see this button. For more information, see "Who Can Create and Manage Virtual Services?" on page 31.</p> <div style="background-color: #f0f0f0; padding: 10px;"> <p>Note: Keep the following in mind:</p> <ul style="list-style-type: none"> ■ You must set the Integration Server property <code>watt.server.auth.skipForMediator</code> to "true" and then restart Integration Server for the change to take effect. This property is located in the server configuration file (<code>server.cnf</code>), which is located in the <code>Integration Server_directory \config</code> directory. For details, see the <i>webMethods Integration Server Administrator's Guide</i>. ■ The run-time actions "Require HTTP Basic Authentication" and "Identify Consumer" (with the value HTTP Authentication Token as the identifier) will not be enforced when using the authentication scheme OAuth2. </div> <p>None. Select the following option:</p> <ul style="list-style-type: none"> ■ Invoke Service Anonymously: Does not authenticate requests.
HTTP Headers	<p>The HTTP headers that you want to use to authenticate the requests.</p> <ul style="list-style-type: none"> ■ Use Existing: Use the HTTP headers that are contained in the requests.

Field	Description
	<ul style="list-style-type: none"> ■ Customize: Use the HTTP headers that you specify in the Name and Value columns below. If you need to specify multiple headers, use the plus button to add rows.

Creating a Routing Rule for “Context-based” Routing (SOAP)

To create a routing rule

1. In the **Variable** column, select **Time**, **IP Address**, **Date**, **Consumer**, **Predefined Context Variable** or **Custom Context Variable**. For more information, see ["Using Context Variables in Virtual Services" on page 259](#).
2. In the **Value** column, specify an applicable value. For **Date** choose **Before**, **After** or **Equal To** and enter a date. For **Time** choose **Before** or **After** and enter a time. For **IP Address**, enter numeric values for **Between** and **And**. For **Consumer**, click **Browse** and select a consumer application name. For **Predefined Context Variable** or **Custom Context Variable**, choose the **String** or **Integer** data type. Select a predefined variable name or custom variable name from the drop-down list. For **String**, choose **Equal To** or **Not Equal To** and enter a value. For **Integer**, choose **Greater Than**, **Less Than**, **Not Equal To**, **Equal To** or and enter a value.
 - a. For the list of the predefined context variables, see ["Using Context Variables in Virtual Services" on page 259](#).
 - b. The predefined context variable `PROTOCOL_HEADER` is not available in the drop-down list; to include `PROTOCOL_HEADER` in the rule, define the variable as Custom Context Variable. For more information, see ["The API for Context Variables" on page 265](#).
 - c. If you define a custom context variable in the routing rule, you must write a ["webMethods IS service" on page 247](#) and invoke it in the virtual service's Request Processing step. In this Integration Server service, use the API to get/set the custom context variable. For more information, see ["The API for Context Variables" on page 265](#).
3. If you need to specify multiple variables, use the plus button to add rows.
4. In the **Combination Uses** field, choose an operator for the expression: **AND** (the default) or **OR**.
5. In the **Route To** field, click the **Endpoint** button and choose the URL of the native service to route the request to, if the rule criteria are met.
6. Click the **Configure Endpoint Properties** icon (next to the **Endpoint** button) if you want to configure a set of properties for each endpoint individually. In the dialog box, click the endpoint you want to configure and specify the following fields:

Field	Description
SOAP Optimization Method	<p data-bbox="639 359 1398 422">Optional. Mediator can accept the following optimization methods to optimize the payloads of SOAP requests:</p> <ul style="list-style-type: none"> <li data-bbox="639 447 1398 579">■ MTOM: Indicates that Mediator expects to receive a request with a Message Transmission Optimization Mechanism (MTOM) attachment, and will forward the attachment to the native service. <li data-bbox="639 604 1398 699">■ SwA: Indicates that Mediator expects to receive a “SOAP with Attachment” (SwA) request, and will forward the attachment to the native service. <li data-bbox="639 724 1398 756">■ None (the default). <p data-bbox="639 781 1398 1045">a. Bridging between SwA and MTOM is not supported. If a consumer sends an SwA request, Mediator can only forward SwA to the native provider. The same is true for MTOM, and applies to responses received from the native provider. That is, an SwA or MTOM response received by Mediator from a native provider will be forwarded to the caller using the same format it received.</p> <p data-bbox="639 1071 1398 1377">b. When sending SOAP requests that do <i>not</i> contain a MTOM or SWA attachment to a virtual service for a native provider endpoint that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related' (or the virtual service's Request Processing Step should include an "IS service callout" on page 247 that sets the BUILDER_TYPE context variable to 'multipart/related'). This is necessary so Mediator knows how to parse the response properly.</p>
WSS Header Customization	<p data-bbox="639 1423 1398 1486">Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native service.</p> <ul style="list-style-type: none"> <li data-bbox="639 1512 1398 1644">■ Pass all security headers: Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the virtual service's security run-time policy). <div data-bbox="691 1669 1398 1860" style="background-color: #f0f0f0; padding: 10px;"> <p data-bbox="703 1682 1398 1860">Note: If the virtual service does not contain a security run-time policy, and the <code>mustUnderstand</code> attribute of the security header is <code>0/false</code>, then Mediator will <i>always</i> forward the security header to the native service.</p> </div>

Field	Description
	<ul style="list-style-type: none"> Remove processed security header from request before routing: Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the virtual service's security run-time policy). Note that Mediator will <i>not</i> remove the security header if <i>both</i> of the following conditions are true: 1) Mediator did not process the security header, and 2) the <code>mustUnderstand</code> attribute of the security header is 0/false).
HTTP Connection Timeout	<p>The time interval (in seconds) after which a connection attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.connectionTimeout</code> located in the file <code>Integration Server_directory/packages/WmMediator/config/resources/pg-config.properties</code>. The default of that property is 30 seconds.</p>
Read Timeout	<p>The time interval (in seconds) after which a socket read attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.readTimeout</code> located in the file <code>Integration Server_directory/packages/WmMediator/config/resources/pg-config.properties</code>. The default of that property is 30 seconds.</p>
SSL Options	<p>To enable SSL client authentication for the endpoint, you must specify values for both the Client Certificate Alias field and the IS Keystore Alias field. If you specify a value for only one of these fields, a deployment error will occur.</p> <div data-bbox="643 1398 1396 1497" style="background-color: #f0f0f0; padding: 5px;"> <p>Note: SSL client authentication is optional; you may leave both fields blank.</p> </div> <ul style="list-style-type: none"> Client Certificate Alias: The client's private key to be used for performing SSL client authentication. If you specify a client certificate alias, you must also include in the virtual service's policy the "Require SSL" action and select that action's "Client Certificate Required" option. The "Client Certificate Required" option specifies whether client certificates are required for the purposes of: 1) Verifying the signature of signed SOAP requests or decrypting encrypted SOAP requests, and 2) Signing SOAP responses or encrypting SOAP responses.

Field	Description
	<ul style="list-style-type: none"> ■ IS Keystore Alias: The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) will be used for performing SSL client authentication.

7. Click **OK**.

“Load Balancing” Routing (SOAP)

If your Entry Protocol is HTTP or HTTPS, you can choose to use the “Load Balancing” routing protocol. (Alternatively, you can choose “Straight Through”, “Content-Based” or “Context-Based” routing.)

If you have a Web service that is hosted at two or more endpoints, you can use the Load Balancing option to distribute requests among the endpoints.

Requests are distributed across multiple endpoints. The requests are intelligently routed based on the “round-robin” execution strategy. The load for a service is balanced by directing requests to two or more services in a pool, until the optimum level is achieved. The application routes requests to services in the pool sequentially, starting from the first to the last service without considering the individual performance of the services. After the requests have been forwarded to all the services in the pool, the first service is chosen for the next loop of forwarding.

Load-balanced endpoints also have automatic Failover capability. If a load-balanced endpoint is unavailable (for example, if a connection is refused), then that endpoint is marked as “down” for the number of seconds you specify in the “Suspend the Failed Endpoint” field (during which the endpoint will not be used for sending the request), and the next configured endpoint is tried. If all the configured load-balanced endpoints are down, then a SOAP fault is sent back to the client. After the suspension period expires, each endpoint marked will be available again to send the request.

To configure “Load Balancing” routing

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see [“Viewing or Editing Virtualized Services” on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab, specify the following fields, and click **Save**.

In this field...	Specify...
HTTP or JMS	HTTP.
Routing Type	Load Balancing

In this field...	Specify...
Route To	<p>The URLs of two or more native services in a pool to which the requests will be routed. The application routes the requests to services in the pool sequentially, starting from the first to the last service without considering the individual performance of the services. After the requests have been forwarded to all the services in the pool, the first service is chosen for the next loop of forwarding.</p> <p>To specify the first service, click the Endpoint button and select the URL of the Web service to route the request to. To specify additional services, use the plus button next to the field to add rows.</p> <p>Alternatively, Mediator offers “Local Optimization” capability if the native service and the virtual service (in Mediator) are located on the same machine. With local optimization, service invocation happens in-memory and not through a network hop. In the Default To field, specify the native service in either of the following forms:</p>
	<pre>local://<service_full_path></pre>
	OR
	<pre>local://<server>:<port>/ws/<service_full_path></pre>
	For example:
	<pre>local://MediatorTestServices:NewMediatorTestServices_Port</pre>
	<p>which points to the endpoint service NewMediatorTestServices_Port which is present under the folder MediatorTestServices in Integration Server. This works for HTTP endpoints only, for all types of Routing Protocols.</p>
Configure Endpoint Properties icon	<p>This button displays a dialog box that enables you to configure a single set of properties that will be shared by all the endpoints. In the dialog box, specify the following fields:</p> <ul style="list-style-type: none"> ■ SOAP Optimization Method: Optional. Mediator can accept the following optimization methods to optimize the payloads of SOAP requests: <ul style="list-style-type: none"> ■ MTOM: Indicates that Mediator expects to receive a request with a Message Transmission Optimization Mechanism (MTOM) attachment, and will forward the attachment to the native service. ■ SwA: Indicates that Mediator expects to receive a “SOAP with Attachment” (SwA) request, and will forward the attachment to the native service.

In this field...	Specify...
	<ul style="list-style-type: none"> ■ None (the default). 1. Bridging between SwA and MTOM is not supported. If a consumer sends an SwA request, Mediator can only forward SwA to the native provider. The same is true for MTOM, and applies to responses received from the native provider. That is, an SwA or MTOM response received by Mediator from a native provider will be forwarded to the caller using the same format it received. 2. When sending SOAP requests that do <i>not</i> contain a MTOM or SWA attachment to a virtual service for a native provider endpoint that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related' (or the virtual service's Request Processing Step should include an "IS service callout" on page 247 that sets the BUILDER_TYPE context variable to 'multipart/related'). When this timeout value expires, the system routes the execution of the virtual service to the next consecutive Web service endpoint specified in the Route To field.</p>
HTTP Authentication	<p data-bbox="516 1696 1408 1759">Authentication Scheme: Specify the mode of authentication: Basic Authentication (default), NTLM, OAuth2 or None.</p> <p data-bbox="516 1780 1408 1812">Basic Authentication. Select one of the following options:</p> <ul style="list-style-type: none"> <li data-bbox="516 1833 1408 1894">■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header.

In this field...**Specify...**

Mediator passes the "Authorization" header present in the original client request to the native service.

- **Use specified credentials:** Authenticates requests according to the values you specify in the **User**, **Password** and **Domain** fields.

NTLM. Note that if Mediator is used to access a native service protected by NTLM (which is typically hosted in IIS), then the native service in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as "Windows", then "NTLM" should be in its list. The "Negotiate" handshake will be supported in the near future. This note applies to all three of the following options for NTLM:

- **Use credentials from incoming request:** Default. Mediator uses the user credentials passed in the request header for an NTLM handshake with the server.
- **Use specified credentials:** Mediator uses the values you specify in the **User**, **Password** and **Domain** fields for an NTLM handshake with the server.
- **Transparent:** If the property `watt.pg.disableNtlmAuthHandler` is set to `false` (the default), then Mediator will behave in "pass by" mode, allowing an NTLM handshake to occur between the client and server. If the property `watt.pg.disableNtlmAuthHandler` is set to `true`, then Mediator performs the Kerberos Windows authentication (and not NTLM Windows authentication). This property is located in `Integration Server_directory \instances \instance_name \config \server.cnf`. Note: If the client is a WCF application, then the client should be configured with `clientCredentialType` set to NTLM.

OAuth2. Select one of the following options:

- **Use credentials from incoming request:** Default. This is known as "pass through" mode, in which the consumer includes an OAuth2 access token (a "Bearer" type token) in the request. Mediator then passes the access token unchanged to the native OAuth server.
- **Use specified token:** In this mode, the consumer does not include an OAuth2 access token in the request. Instead, the provider generates an OAuth2 access token for each consumer, and Mediator stores the access tokens in Passman. When consumers send requests, Mediator obtains the OAuth2 access tokens from Passman and uses them to access the native services. Specify an OAuth access token to be deployed by Mediator. If you select this option, the consumer need not pass the OAuth token during service invocation. Click the **Show Token** button to view the OAuth

In this field...**Specify...**

access token. Users who do not have the permissions to create and manage virtual services will not see this button.

Specify an OAuth access token to be deployed by Mediator by clicking the Show Token button and selecting an OAuth access token. Users who do not have the permissions to create and manage virtual services will not see this button. For more information, see ["Who Can Create and Manage Virtual Services?" on page 31](#).

Note: Keep the following in mind:

- You must set the Integration Server property `watt.server.auth.skipForMediator` to "true" and then restart Integration Server for the change to take effect. This property is located in the server configuration file (`server.cnf`), which is located in the *Integration Server_directory \config* directory. For details, see the *webMethods Integration Server Administrator's Guide*.
- The run-time actions "Require HTTP Basic Authentication" and "Identify Consumer" (with the value **HTTP Authentication Token** as the identifier) will not be enforced when using the authentication scheme **OAuth2**.

None. Select the following option:

- **Invoke Service Anonymously:** Does not authenticate requests.

HTTP Headers

The HTTP headers that you want to use to authenticate the requests.

- **Use Existing:** Use the HTTP headers that are contained in the requests.
- **Customize:** Use the HTTP headers that you specify in the **Name** and **Value** columns below. If you need to specify multiple headers, use the plus button to add rows.

The Routing Protocol for Services Exposed over JMS (SOAP)

You can use the Routing Protocols step to specify a JMS queue to which the Mediator is to submit the request, and the destination to which the native service is to return the response.

To configure the Routing Protocols step for virtual services exposed over JMS

1. In CentraSite Control, display the details page of SOAP virtual service. If you need procedures for this step, see "[Viewing or Editing Virtualized Services](#)" on page 82.
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab and select the **JMS** button. On this tab specify the following JMS routing protocol fields, and click **Save**.

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In this field...	Specify...
JMS URI	<p>A connection alias for connecting to the JMS provider (e.g., an Integration Server alias or a JNDI URL). For example, a JNDI URL of the form:</p> <pre>jms:queue:dynamicQueues/MyRequestQueue? wm-wsendpointalias=MediatorConsumer &targetService=vs-jms-in-echo</pre> <p>Note that the <code>wm-wsendpointalias</code> parameter is required for Integration Server/Mediator to look up the JMS consumer alias to send the request to the specified queue (e.g., <code>MyRequestQueue</code>), which is a dynamic queue in ActiveMQ. Also, the <code>targetService</code> parameter is required if sending to another virtual service that uses JMS as the entry protocol.</p>
Priority	Optional. A numeric value that specifies the priority of the JMS message in the queue.
Reply to Destination	Optional. A queue name for the incoming JMS request.
Time to Live	Optional. A numeric value (in milliseconds) that specifies the lifespan of the JMS message.
Delivery Mode	<p>Optional. The type of message delivery to the endpoint.</p> <ul style="list-style-type: none"> ■ None (default). ■ Persistent: The message is stored by the JMS server before delivering it to the consumer. ■ Non-Persistent: The message is not stored before delivery.
Message Properties	The message properties to use.

In this field...	Specify...
	<ul style="list-style-type: none"> ■ Use Existing (default): Use existing properties. ■ Customize: Specify one or more property names and values. To add additional rows, use the plus button.
JMS Headers	<p>The JMS headers that you want to use to authenticate the requests.</p> <ul style="list-style-type: none"> ■ Use Existing (default): Use existing headers. ■ Customize: Specify one or more header names and values. To add additional rows, use the plus button.

Viewing REST/XML-based Virtual Services

The CentraSite Control user interface enables you to view and examine the processing steps for a virtual REST or XML service.

Important: *This is of specific relevance to REST and XML based virtual service assets.* Beginning with version 9.7, CentraSite supports the enhanced interface for REST and XML service assets (in contrast, earlier versions of CentraSite supported a standardized interface for REST and XML service assets). Note that the standardized REST and XML service interface that was implemented by versions of CentraSite prior to version 9.7 is not compatible with the enhanced interface that is implemented by current version of CentraSite. Documentation of the prior REST and XML service interface is available to Software AG customers who have a current maintenance contract in Empower, Software AG's global extranet (<http://empower.softwareag.com/>).

If You Migrate REST/XML Services from a Pre-9.7 Release

If you have REST and XML services that were created prior to version 9.7, these REST services will continue to hold the old version's metadata in the enhanced REST service interface implemented by current version of CentraSite. Keep in mind that you can only view properties of the REST and XML services in CentraSite Control. You cannot configure properties of the REST or XML services using the CentraSite Control user interface (not even if you belong to the CentraSite Administrator role). You will only be able to configure the properties using the CentraSite Business UI.

The Entry Protocol Step (REST/XML)

Perform the following steps to view and examine the **Entry Protocol** step for a virtual REST or XML service.

To examine the Entry Protocol step

1. In CentraSite Control, display the details page of REST/XML virtual service. If you need procedures for this step, see "[Viewing or Editing Virtualized Services](#)" on page 82.
2. Open the **Processing Steps** profile.
3. Select the **Entry Protocol** tab. On this tab, examine the following fields:

Field	Describes
Protocol	Specifies the protocol (HTTP and/or HTTPS) over which the virtual REST service or virtual XML service accepts requests.
HTTP Methods	Specifies the HTTP methods (GET, POST, PUT, DELETE) that the virtual service should be allowed to perform on a REST resource.

The Request Processing Step (REST/XML)

Perform the following steps to view and examine the **Request Processing** step for a virtual REST or XML service.

To examine the Request Processing step

1. In CentraSite Control, display the details page of REST/XML virtual service. If you need procedures for this step, see "[Viewing or Editing Virtualized Services](#)" on page 82.
2. Open the **Processing Steps** profile.
3. Select the **Request Processing** tab. On this tab, click the step **Transform** or **webMethods IS Service**, and examine the following fields:

Step	Description
Transform	Specifies the XSLT transformation file used to perform an XSLT message transformation on the request message before it is submitted to the native REST/XML service.
webMethods IS Service	Specifies the webMethods IS services that is used to manipulate the request (the axis2 MessageContext instance).

The Response Processing Step (REST/XML)

Perform the following steps to view and examine the **Response Processing** step for a virtual REST or XML service.

To examine the Response Processing step

1. In CentraSite Control, display the details page of REST/XML virtual service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services" on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Response Processing** tab. This tab includes one **Error Messaging** step, one or more **Transform** steps and one or more **webMethods IS Service** steps as follows.

Step	Description
Error Messaging	Specifies the error responses for the virtual REST/XML service. Alternatively, you can have global error responses for all virtual services that are configured using Mediator's Service Fault Configuration screen, as described in <i>Administering webMethods Mediator</i> .
Transform	Specifies the XSLT transformation file to transform the response payloads from XML format to the format required by the consumer.
webMethods IS Service	Specifies the webMethods IS services to process the response message from the native service before it is returned to the consuming application. For more information, see "Invoking webMethods IS Services in Virtual Services" on page 247 .

The Routing Protocols Step (REST/XML)

If your Entry Protocol is HTTP or HTTPS, you can have one of the following routing protocols for a virtual REST/ XML service.

The "Straight Through" Routing Protocol Step (REST/XML)

Perform the following steps to examine the "Straight Through" routing of a virtual REST or XML service.

To examine “Straight Through” routing

1. In CentraSite Control, display the details page of REST/XML virtual service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services" on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab. On this tab, examine the following fields.

Field	Description
Service Type	Specifies XML (for a native REST or XML service).
Routing Type	Specifies the routing type Straight Through .
HTTP Method	Specifies the HTTP method to pass to the native service.
Default To	Specifies the URL of the native service to route the request to.
Configure Endpoint Properties icon	<p>This icon displays a dialog box that enables you to examine the properties defined for an endpoint as follows:</p> <ul style="list-style-type: none"> ■ HTTP Connection Timeout: The time interval (in seconds) after which a connection attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.connectionTimeout</code> located in the file <code>Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties</code>. The default of that property is 30 seconds. ■ Read Timeout: The time interval (in seconds) after which a socket read attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.readTimeout</code> located in the file <code>Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties</code>. The default of that property is 30 seconds. ■ SSL Options: Enables SSL client authentication for the endpoint. <ul style="list-style-type: none"> ■ Client Certificate Alias: The client's private key used for performing SSL client authentication. ■ IS Keystore Alias: The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) is used for performing SSL client authentication.

Field	Description
HTTP Authentication	<p data-bbox="505 323 1398 390">Authentication Scheme: Specifies the mode of authentication: Basic Authentication (default), NTLM, OAuth2 or None.</p> <p data-bbox="505 436 748 468">Basic Authentication.</p> <ul data-bbox="505 491 1398 716" style="list-style-type: none"> <li data-bbox="505 491 1398 625">■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header. Mediator passes the “Authorization” header present in the original client request to the native service. <li data-bbox="505 648 1398 716">■ Use specified credentials: Authenticates requests according to the values you specify in the User, Password and Domain fields. <p data-bbox="505 758 1398 995">NTLM. Note that if Mediator is used to access a native service protected by NTLM (which is typically hosted in IIS), then the native service in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as “Windows”, then “NTLM” should be in its list. The “Negotiate” handshake will be supported in the near future. This note applies to all three of the following options for NTLM:</p> <ul data-bbox="505 1018 1398 1604" style="list-style-type: none"> <li data-bbox="505 1018 1398 1115">■ Use credentials from incoming request: Default. Mediator uses the user credentials passed in the request header for an NTLM handshake with the server. <li data-bbox="505 1138 1398 1234">■ Use specified credentials: Mediator uses the values specifies in the User, Password and Domain fields for an NTLM handshake with the server. <li data-bbox="505 1257 1398 1604">■ Transparent: If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>false</code> (the default), then Mediator will behave in “pass by” mode, allowing an NTLM handshake to occur between the client and server. If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>true</code>, then Mediator performs the Kerberos Windows authentication (and not NTLM Windows authentication). This property is located in <code>Integration Server_directory \instances \instance_name \config \server.cnf</code>. Note: If the client is a WCF application, then the client should be configured with <code>clientCredentialType</code> set to NTLM. <p data-bbox="505 1646 597 1677">OAuth2.</p> <ul data-bbox="505 1701 1398 1921" style="list-style-type: none"> <li data-bbox="505 1701 1398 1835">■ Use credentials from incoming request: Default. This is known as “pass through” mode, in which the consumer includes an OAuth2 access token (a “Bearer” type token) in the request. Mediator then passes the access token unchanged to the native OAuth server. <li data-bbox="505 1858 1398 1921">■ Use specified token: In this mode, the consumer does not include an OAuth2 access token in the request. Instead, the provider

Field	Description
	<p>generates an OAuth2 access token for each consumer, and Mediator stores the access tokens in Passman. When consumers send requests, Mediator obtains the OAuth2 access tokens from Passman and uses them to access the native services. Specify an OAuth access token to be deployed by Mediator. If you select this option, the consumer need not pass the OAuth token during service invocation. Click the Show Token button to view the OAuth access token. Users who do not have the permissions to create and manage virtual services will not see this button.</p> <p>None. Select the following option:</p> <ul style="list-style-type: none"> ■ Invoke Service Anonymously: Does not authenticate requests.
HTTP Headers	<p>Specifies the HTTP headers used to authenticate the requests.</p> <ul style="list-style-type: none"> ■ Use Existing: Uses the HTTP headers that are contained in the requests. ■ Customize: Uses the HTTP headers that are specified in the Name and Value columns below.

The “Content-based” Routing Protocol Step (REST or XML)

Perform the following steps to examine the “Content-Based” routing of a virtual REST or XML service.

To examine “Content-Based” routing

1. In CentraSite Control, display the details page of REST/XML virtual service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services" on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab. On this tab, examine the following fields:

Field	Description
Service Type	Specifies XML (for a native REST or XML service).
Routing Type	Specifies the routing type Content-Based .
Routing Rules	<p>Specifies one or more routing rules.</p> <p>Click the Configure Endpoint Properties icon (next to the Endpoint button) for an endpoint.</p>

Field	Description
	<p>This icon displays a dialog box that enables you to examine the properties defined for an endpoint as follows:</p> <ul style="list-style-type: none"> ■ HTTP Connection Timeout: The time interval (in seconds) after which a connection attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.connectionTimeout</code> located in the file <code>Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties</code>. The default of that property is 30 seconds. ■ Read Timeout: The time interval (in seconds) after which a socket read attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property <code>pg.endpoint.readTimeout</code> located in the file <code>Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties</code>. The default of that property is 30 seconds. ■ SSL Options: Enables SSL client authentication for the endpoint. <ul style="list-style-type: none"> ■ Client Certificate Alias: The client's private key used for performing SSL client authentication. ■ IS Keystore Alias: The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) is used for performing SSL client authentication.
HTTP Method	Specifies the HTTP method to pass to the native service.
Default To	Specifies the URL of the native service to route the request to.
HTTP Authentication	<p>Authentication Scheme: Specifies the mode of authentication: Basic Authentication (default), NTLM, OAuth2 or None.</p> <p>Basic Authentication.</p> <ul style="list-style-type: none"> ■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header. Mediator passes the "Authorization" header present in the original client request to the native service. ■ Use specified credentials: Authenticates requests according to the values you specify in the User, Password and Domain fields.

Field	Description
	<p>NTLM. Note that if Mediator is used to access a native service protected by NTLM (which is typically hosted in IIS), then the native service in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as “Windows”, then “NTLM” should be in its list. The “Negotiate” handshake will be supported in the near future. This note applies to all three of the following options for NTLM:</p> <ul style="list-style-type: none"> ■ Use credentials from incoming request: Default. Mediator uses the user credentials passed in the request header for an NTLM handshake with the server. ■ Use specified credentials: Mediator uses the values specifies in the User, Password and Domain fields for an NTLM handshake with the server. ■ Transparent: If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>false</code> (the default), then Mediator will behave in "pass by" mode, allowing an NTLM handshake to occur between the client and server. If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>true</code>, then Mediator performs the Kerberos Windows authentication (and not NTLM Windows authentication). This property is located in <code>Integration Server_directory \instances \instance_name \config \server.cnf</code>. Note: If the client is a WCF application, then the client should be configured with <code>clientCredentialType</code> set to NTLM.
	<p>OAuth2.</p> <ul style="list-style-type: none"> ■ Use credentials from incoming request: Default. This is known as “pass through” mode, in which the consumer includes an OAuth2 access token (a “Bearer” type token) in the request. Mediator then passes the access token unchanged to the native OAuth server. ■ Use specified token: In this mode, the consumer does not include an OAuth2 access token in the request. The “Load Balancing” Routing Protocol Step (REST or XML)

Perform the following steps to examine the “Load Balancing” routing of a virtual REST or XML service.

To examine “Load Balancing” routing

1. In CentraSite Control, display the details page of REST/XML virtual service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services" on page 82](#).
2. Open the **Processing Steps** profile.
3. Select the **Routing Protocols** tab. On this tab, examine the following fields.

Field	Description
Service Type	Specifies XML (for a native REST or XML service).
Routing Type	Specifies the routing type Load Balancing .
Routing Rules	Specifies one or more routing rules. Click the Configure Endpoint Properties icon (next to the Endpoint button) for an endpoint.

This icon displays a dialog box that enables you to examine the properties defined for an endpoint as follows:

- **HTTP Connection Timeout:** The time interval (in seconds) after which a connection attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property `pg.endpoint.connectionTimeout` located in the file `Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties`. The default of that property is 30 seconds.
- **Read Timeout:** The time interval (in seconds) after which a socket read attempt will timeout. If a value is not specified (or if the value 0 is specified), Mediator will use the value of the global property `pg.endpoint.readTimeout` located in the file `Integration Server_directory \packages \WmMediator \config \resources \pg-config.properties`. The default of that property is 30 seconds.
- **SSL Options:** Enables SSL client authentication for the endpoint.
 - **Client Certificate Alias:** The client's private key used for performing SSL client authentication.
 - **IS Keystore Alias:** The keystore alias of the instance of Integration Server on which Mediator is running. This value

Field	Description
	(along with the value of Client Certificate Alias) is used for performing SSL client authentication.
HTTP Method	Specifies the HTTP method to pass to the native service.
Default To	Specifies the URL of the native service to route the request to.
HTTP Authentication	Authentication Scheme: Specifies the mode of authentication: Basic Authentication (default), NTLM , OAuth2 or None .
	<p data-bbox="505 678 748 709">Basic Authentication.</p> <ul data-bbox="505 730 1422 961" style="list-style-type: none"> <li data-bbox="505 730 1422 877">■ Use credentials from incoming request: (default): Authenticates requests based on the credentials specified in the HTTP header. Mediator passes the “Authorization” header present in the original client request to the native service. <li data-bbox="505 888 1422 961">■ Use specified credentials: Authenticates requests according to the values you specify in the User, Password and Domain fields.
	<p data-bbox="505 1003 1422 1245">NTLM. Note that if Mediator is used to access a native service protected by NTLM (which is typically hosted in IIS), then the native service in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as “Windows”, then “NTLM” should be in its list. The “Negotiate” handshake will be supported in the near future. This note applies to all three of the following options for NTLM:</p> <ul data-bbox="505 1266 1422 1848" style="list-style-type: none"> <li data-bbox="505 1266 1422 1360">■ Use credentials from incoming request: Default. Mediator uses the user credentials passed in the request header for an NTLM handshake with the server. <li data-bbox="505 1381 1422 1476">■ Use specified credentials: Mediator uses the values specifies in the User, Password and Domain fields for an NTLM handshake with the server. <li data-bbox="505 1497 1422 1848">■ Transparent: If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>false</code> (the default), then Mediator will behave in “pass by” mode, allowing an NTLM handshake to occur between the client and server. If the property <code>watt.pg.disableNtlmAuthHandler</code> is set to <code>true</code>, then Mediator performs the Kerberos Windows authentication (and not NTLM Windows authentication). This property is located in <code>Integration Server_directory \instances \instance_name \config \server.cnf</code>. Note: If the client is a WCF application, then the client should be configured with <code>clientCredentialType</code> set to <code>NTLM</code>.

Field	Description
	<p>OAuth2.</p> <ul style="list-style-type: none"> ■ Use credentials from incoming request: Default. This is known as “pass through” mode, in which the consumer includes an OAuth2 access token (a “Bearer” type token) in the request. Mediator then passes the access token unchanged to the native OAuth server. ■ Use specified token: In this mode, the consumer does not include an OAuth2 access token in the request. Instead, the provider generates an OAuth2 access token for each consumer, and Mediator stores the access tokens in Passman. When consumers send requests, Mediator obtains the OAuth2 access tokens from Passman and uses them to access the native services. Specify an OAuth access token to be deployed by Mediator. If you select this option, the consumer need not pass the OAuth token during service invocation. Click the Show Token button to view the OAuth access token. Users who do not have the permissions to create and manage virtual services will not see this button. <p>None. Select the following option:</p> <ul style="list-style-type: none"> ■ Invoke Service Anonymously: Does not authenticate requests.
HTTP Headers	<p>Specifies the HTTP headers used to authenticate the requests.</p> <ul style="list-style-type: none"> ■ Use Existing: Uses the HTTP headers that are contained in the requests. ■ Customize: Uses the HTTP headers that are specified in the Name and Value columns below.

Viewing or Editing Virtualized Services

Each tab on the detail page of a virtualized service represents a collection of attributes called a profile. You will only see the profiles for which you have View permission. The asset type Service has a unique set of profiles. However, your administrator can configure this asset type to display a customized set of profiles and attributes.

Important: *This is of specific relevance to REST and XML based virtual service assets. Beginning with version 9.7, CentraSite supports the enhanced interface for REST and XML service assets (in contrast, earlier versions of CentraSite supported a standardized interface for REST and XML service assets). Note that the standardized REST and XML service interface that was implemented by versions of CentraSite prior to version 9.7 is not compatible with the enhanced interface that is implemented by current version of CentraSite. Documentation of the prior REST and XML service interface is available*

to Software AG customers who have a current maintenance contract in Empower, Software AG's global extranet (<http://empower.softwareag.com/>).

If You Migrate REST/XML Services from a Pre-9.7 Release

If you have REST and XML services that were created prior to version 9.7, these REST services will continue to hold the old version's metadata in the enhanced REST service interface implemented by current version of CentraSite. Keep in mind that you can only view properties of the REST and XML services in CentraSite Control. You cannot configure properties of the REST or XML services using the CentraSite Control user interface (not even if you belong to the CentraSite Administrator role). You will only be able to configure the properties using the CentraSite Business UI.

When editing attributes, keep the following points in mind:

- If you are not the owner of the virtual service, you cannot edit the virtual service unless you have Modify permission on the virtual service (granted through either a role-based permission or an instance-level permission).
- When you view the details for the virtual service, you will only see profiles for which you have View permission. You will only be able to edit the profiles on which you have Modify permission.
- Some attributes accept only specific types of information. For example, if the virtual service includes a URL type attribute, you must supply a URL when you edit that attribute. Other attribute types that require a specific type of value include Date attributes and Email attributes.
- Some attributes are designed to be read-only and cannot be edited even if they appear in a virtual service on which you have Modify permission.

To view or edit the detail pages of a virtualized service

1. In CentraSite Control, go to **Asset Catalog > Browse Catalog**.
2. On the **Browse Catalog** page, perform a keyword search or advanced search to display the virtualized services. For procedures, see *CentraSite User's Guide*.
3. Locate the virtualized service whose details you want to view or edit and, from its context menu, select **Details**.

If you want to edit multiple services, mark the checkboxes of all desired services, and from the **Actions** menu, click **Details**. The detail page for each of the selected services is now displayed.

4. To edit an asset's **Name**, **Description** or user-defined version number, make sure the service is undeployed, then place the cursor in the appropriate field and modify the text as required.
5. To modify the extended attributes associated with the virtual service, do the following:
 - a. Select the profile that contains the attribute(s) that you want to modify.
 - b. Edit the attributes on the profile as necessary.

For a SOAP-based Virtual Service only: You can upload a new WSDL file, or update an existing WSDL file.

You attach a WSDL file to the catalog entry using the **Attach WSDL** command in the virtual service's **Actions** menu. If you are attaching a WSDL file to a service that already has a WSDL, the service name in the new WSDL must be identical to the service name in the existing one, or the process will fail.

- c. Repeat steps 5.a and 5.b for each profile that you want to edit.

Note: If at any time you want to abandon your unsaved edits, click **Close**. CentraSite will ask you if you want to save your edits. Click **No** to abandon your edits and return the virtual service's attributes to their previous settings.

6. When you have finished making your edits, click **Save**.

You can view a tooltip text for any attribute in a profile of the virtualized service's detail page by moving the cursor to the attribute name. The tooltip text gives a summary of the attribute's purpose. The tooltip text shown is the content of the attribute's `Description` field, as defined for the virtualized service in the Service type definition. See *CentraSite Administrator's Guide* for information on defining attributes for Service type.

The Summary Profile

The virtualized service's **Summary** profile displays general information about the service, including:

For this service type...	The profile displays...
Virtual Service	The WSDL file and the native service's endpoint(s).
Virtual REST Service	The schema file, the native service's endpoint(s) and the HTTP methods (GET, POST, PUT, DELETE or Use Context Variable) that the native service accepts in requests.
Virtual XML Service	The schema file and the native service's endpoint(s).

The Technical Details Profile

The **Technical Details** profile displays the following:

<u>For this virtualized service type...</u>	<u>The profile displays...</u>
Web service	<ul style="list-style-type: none"> ■ The WSDL file of the Web service. ■ The native service's endpoint.
REST service or XML service	<ul style="list-style-type: none"> ■ The schema file of the REST service or XML service. ■ The native service endpoint. ■ The MIME type of the data supported by the service. For a REST service, this is often application/xml or application/json type but can be any other valid MIME type. For an XML service, this is only application/xml type. ■ The set of operations supported by the service using HTTP methods (e.g., POST, GET, PUT or DELETE). ■ The search string used by the server to find a set of matching resources.

The Specification Profile

You use the virtualized service's **Specification** profile to view or modify the following fields.

<u>Field</u>	<u>Description</u>
Functional Requirements	You can attach a document by either pointing to a URL, or selecting a document from the Supporting Document Library. You can also upload a new document to the library. For details about the Supporting Document Library, see the <i>CentraSite User's Guide</i> .
Non-functional Requirements	You can attach a document by either pointing to a URL, or selecting a document from the Supporting Document Library. You can also upload a new document to the library.
Error Messages and Codes	You can attach a document by either pointing to a URL, or selecting a document from the Supporting

Field	Description
	Document Library. You can also upload a new document to the library.
Usage Examples	You can attach a document by either pointing to a URL, or selecting a document from the Supporting Document Library. You can also upload a new document to the library.
Release Notes	You can attach a document by either pointing to a URL, or selecting a document from the Supporting Document Library. You can also upload a new document to the library.
Demo WSDL URL	You can view or modify the Demo WSDL URL.
Documentation URL	You can view or modify the Documentation URL.
Consumer WSDL	<p>If the built-in policy Consumer WSDL Generator has been activated, this field will display a <i>Consumer WSDL</i>. For information about this policy, see the <i>CentraSite User's Guide</i>.)</p> <p>A Consumer WSDL is created in addition to the virtual service's WSDL. The virtual service's WSDL will be used by Mediator. The Consumer WSDL can be used by the consumer (the user) to create a request for the service. The Consumer WSDL will contain WS-Security policies inline in the consumer WSDL as follows:</p> <ul style="list-style-type: none"> ■ If the virtual service contains WS-Security policies, then the WS-Security policies are included inline in the Consumer WSDL. Any WS-Security policies contained in the native service's WSDL are removed. ■ If the virtual service does <i>not</i> contain WS-Security policies, then the WS-Security policies contained in the native service's WSDL (if any) are included inline in the Consumer WSDL.

The Consumers Profile

You use the virtualized service's **Consumers** profile to specify the consumer applications, users and groups that are allowed to request the service. Specify the following fields and click **Save**.

In this field...	Specify...
Application	<p>One or more application assets, which represent the consumer applications that are allowed to request the service.</p> <p>Click Add Applications to select from the list of application assets that are registered in CentraSite. For more information, see the <i>CentraSite User's Guide</i>.</p> <p>To remove an application asset from this list, select the check box next to its name and click Delete.</p>
Users/Groups	<p>One or more users and/or groups that are allowed to request the service.</p> <p>Click Add Users/Groups to select from the list of users and groups that are registered in CentraSite. To remove a user or group from this list, select the check box next to its name and click Delete.</p>

The Permissions Profile

You use the virtualized service's **Permissions** profile to set permissions for the service. For information, see the *CentraSite Administrator's Guide*.

Important: To set permissions on a virtualized service, you must have the Full instance-level permission on the native service from which the service was generated (or you must belong to a role that has the Manage Assets permission).

The Policies Profile

The virtualized service's **Policies** profile displays a list of all design-time policies and run-time policies that apply to the service. To view a policy's detail page, click the hyperlinked policy name.

The Deployment Profile

For instructions on deploying, undeploying and redeploying virtualized services, see "[Deploying Virtualized Services and Consumer Applications](#)" on page 126.

The Performance Profile

The virtualized service's **Performance** profile displays the Key Performance Indicator (KPI) metrics that have been published for the service. You can filter the list by target and time period.

- Note:** Keep the following in mind:
- Ensure that Mediator is configured to collect and report run-time events to CentraSite, as described in *Administering webMethods Mediator*.
 - Ensure that CentraSite is configured to receive run-time events from Mediator, as described in "[Run-Time Governance Reference](#)" on page 313.
- Note:** If you receive a Javascript error when trying to display the **Performance** profile, please install the latest versions of the Adobe Flash Player/Shockwave Player plug-ins on your Microsoft Internet Explorer.

To view KPI metrics

1. In CentraSite Control, display the details page of virtualized service. If you need procedures for this step, see "[Viewing or Editing Virtualized Services](#)" on page 82.
2. Open the **Performance** profile.
3. Use the **Switch to** button to switch between a tabular view of the metrics or a graphical view.
4. When viewing metrics in Tabular View, specify the following fields:

In this field...	Specify...
Select Target	A target to which the virtualized service is deployed, or select All to view the metrics of all targets to which the virtualized service is deployed.
Start Date/End Date	The time period from which to view the metrics.

5. Click **Search**.

The table displays metrics for all performance categories (Success Request Count, Total Request Count, Fault Count, etc.).

You can view a tooltip text for any attribute in a profile of the virtualized service's detail page by moving the cursor to the attribute name. The tooltip text gives a summary of the attribute's purpose. The tooltip text shown is the content of the attribute's `Description` field, as defined for the virtualized service in the Service type definition. See *CentraSite Administrator's Guide* for information on defining attributes for Service type.

The Events Profile

The virtualized service's **Events** profile displays the run-time events for the service. You can filter the list by target, event type and time period.

Note: Keep the following in mind:

- Ensure that Mediator is configured to collect and report run-time events to CentraSite, as described in *Administering webMethods Mediator*.
- Ensure that CentraSite is configured to receive run-time events from Mediator, as described in "[Run-Time Governance Reference](#)" on page 313.

To view run-time events for a virtualized service

1. In CentraSite Control, display the virtualized service's detail page. For procedures, see the *CentraSite User's Guide*.
2. Filter the event list you want to generate as follows:

In this field...	Specify...
Target Type	The type of the target on which the event occurred.
Target	The target on which the event occurred, or select All Targets .
Event Type	A run-time event type, or select All Events .
Date Range	A range of dates from which to view the events. If you select a value for Date Range, then Start Date/Time and End Date/Time are ignored.
Start Date	Click the calendar to specify a start date and time.
End Date	Click the calendar to specify an end date and time.

3. Click **Search**.
4. The generated event list displays the following information:

Column	Description
Date/Time	The date/time of the event. Click this hyperlinked value to view the payload of the request/response.

Column	Description
Session ID	The SOAP invocation session ID of the event.
Event Type	The type of run-time event.
Service Name	The name of the service involved in the event.
Service Type	The service's type.
Target	The target on which the event occurred.
Target Type	The target's type.

To configure CentraSite to log run-time events, see the *CentraSite Administrator's Guide*.

Note: To view lists of all events for all virtualized services of a particular target (or for all targets), see "[Run-Time Governance Reference](#)" on page 313.

Revising Virtualized Services

For details, see "[Virtualized Services in CentraSite](#)" on page 29

Creating Run-Time Policies

You create run-time policies and apply them to virtual services in order to govern the virtual services' run-time execution.

A run-time policy is a sequence of actions that are carried out by a policy-enforcement point (PEP) when a consumer requests a particular service through the PEP. The actions in a run-time policy perform activities such as identifying/authenticating consumers, validating digital signatures and capturing performance metrics. You create run-time policies using CentraSite Control and store them in the CentraSite registry/repository.

When you create a run-time policy in CentraSite Control, you:

- Specify the PEP target type (for example, webMethods Mediator) to which you will deploy the virtual services and their policies.
- Add run-time actions to the policy and configure their parameters. CentraSite provides a set of built-in run-time actions.
- Apply the policy to the desired virtual services.
- Activate the policy.

The content is organized under the following sections:

Actions that Run-Time Policies Can Execute

A run-time action is a single task that is included in a run-time policy and is evaluated by a policy-enforcement point (PEP). Actions in run-time policies perform tasks such as identifying/authenticating consumers and logging transaction activity. You specify actions when you define the policy. The PEP evaluates actions in the order in which they appear in the list of actions.

CentraSite provides *run-time action templates*. A run-time action template is a definition of an action that can be used in a run-time policy. Most action templates specify a set of parameters associated with a particular policy action. For example, when you configure the action that identifies consumers you specify an identifier (for example, an HTTP Authentication token) to identify the consumers who are trying to access the services. You can include multiple actions in a single policy.

Using the action templates, you can configure the following types of run-time actions:

■ WS-SecurityPolicy 1.2 actions

Mediator provides two kinds of actions that support WS-SecurityPolicy 1.2: authentication actions and XML security actions.

- You use the authentication actions to verify that the service consumer has the proper credentials to access a virtual service. You can authenticate consumers by their WSS X.509 certificates, WSS Username tokens or WSS SAML tokens.
- You use the XML security actions to provide confidentiality (through encryption) and integrity (through signatures) for request and response messages.

■ Monitoring actions

Mediator provides the following run-time monitoring actions:

- The “Monitor Service Performance” action, which monitors a user-specified set of run-time performance conditions for a virtual service, and sends alerts to a specified destination when these conditions are violated.
- The “Monitor Service Level Agreement” action, which provides the same functionality as “Monitor Service Performance”, but this action is different because it enables you to monitor a virtual service's run-time performance for particular consumers. You configure this action to define a *Service Level Agreement (SLA)*, which is set of conditions that defines the level of performance that a specified consumer should expect from a service.
- The “Throttling Traffic Optimization” action (not available in Mediator versions below 9.0), which limits the number of service invocations allowed during a specified time interval, and sends alerts to a specified destination when the performance conditions are violated. You can use this action to avoid overloading the back-end services and their infrastructure, to limit specific consumers in terms of resource usage, etc.

■ Additional actions

Mediator provides the following actions, which you can use in conjunction with the actions above.

- “Identify Consumer”, which you use in conjunction with an authentication action (“Require WSS Username Token”, “Require WSS X.509 Token” or “Require HTTP Basic Authentication”). Alternatively, you can use this action alone to identify consumers only by host name or IP address.
- “Require HTTP Basic Authentication”, which uses HTTP basic authentication to verify the consumer's authentication credentials contained in the request's Authorization header against the Integration Server.
- “Authorize User”, which authorizes consumers against a list of users and/or a list of groups registered in the Integration Server on which Mediator is running. You use this action in conjunction with an authentication action (“Require WSS Username Token”, “Require WSS SAML Token” or *Require HTTP Basic Authentication*).
- “Authorize Against Registered Consumers”, which authorizes consumer applications against all Application assets that are registered in CentraSite as consumers for the service.
- “Log Invocation”, which logs request/response payloads to a destination you specify.
- “Validate Schema”, which validates all XML request and/or response messages against an XML schema referenced in the WSDL.

For detailed descriptions of these actions, see ["Built-In Run-Time Actions Reference for Virtual Services" on page 333](#).

Who Can Create and Manage Run-Time Policies?

To create and manage run-time policies, you must belong to a role that includes the Manage Runtime Policies permission (or the Manage System-wide Runtime Policies permission).

By default, the following predefined roles include the Manage Runtime Policies permission:

- Organization Administrator
- Policy Administrator

By default, the following predefined roles include the Manage System-wide Runtime Policies permission:

- CentraSite Administrator
- Operations Administrator

Note: For more information about roles and permissions, see *Getting Started with CentraSite*.

Creating a Run-Time Policy

To create a run-time policy in CentraSite, you perform the following high-level steps:

1. Create a new run-time policy. During this step, you select the actions you want the policy to execute, and you assign values to the action parameters.
2. Allow other users to view, edit and/or delete this policy by assigning permissions to those users. For procedures, see "[Setting Permissions on a Run-Time Policy](#)" on page 96.
3. Activate the policy. During this step, you make the new policy ready to deploy to a PEP. For procedures, see "[Activating a Run-Time Policy](#)" on page 98.

Perform these steps to create a run-time policy and save it to CentraSite.

To create a run-time policy

1. In CentraSite Control, go to **Policies > Run-Time**.
2. Click **Add Policy**.
3. In the **Policy Information** panel, specify the following fields:

In this field...	Specify...
Name	A name for the new policy. A policy name can contain any character (including spaces).
Description	<i>Optional.</i> A description for the new policy. This description appears when a user displays a list of policies in the user interface.
Version	<i>Optional.</i> A version identifier for the new policy.

Note: The version identifier does not need to be numeric.

Examples:

```
0.0a
1.0.0 (beta)
Pre-release 001
V1-2007.04.30
```

Note: The version identifier you enter here is the policy's public, user-assigned version identifier. CentraSite also maintains an internal, system-assigned version number for the policy. For more information about user-assigned and system-

In this field...	Specify...
	assigned version identifiers, see " System-Assigned vs. User-Assigned Version Identifiers " on page 108.

4. In the **Scope** panel, specify the following fields. *Scope* refers to the set of properties that determine the target type, organization and asset type to which the policy applies.

In this field...	Specify...
Target Type	The target type to which the policy will be deployed. Select webMethods Integration Server (i.e., the webMethods Mediator gateway type).
Organization	The organization to which the policy applies. Choose All if you want to apply the policy to the specified services in all organizations. <p>Important Once you create a policy, its organizational scope is fixed and cannot be changed. That is, if you create a policy whose scope is specific to organization ABC, you cannot change its scope to make it system-wide or switch it to another organization. You must create a new policy and set its organizational scope as needed.</p>
Asset Types	The type of asset to which this policy applies. Choose one of the following: <ul style="list-style-type: none"> ■ Service ■ XML Service ■ REST Service ■ Virtual Service ■ Virtual XML Service ■ Virtual REST Service <p>Note: CentraSite does not provide out-of-the-box policy-enforcement for web services.</p>

5. In the **Apply Policy to Services that Meet the Following Criteria** panel, specify criteria that identify the virtual services to which the policy applies.

To target a policy for a particular set of virtual services, you refine the policy's scope by specifying additional selection criteria based on the virtual service's Name, Description or Classification properties.

- a. Choose an attribute (Name, Description or Classification) that identifies the services to which the policy applies.
- b. Choose an operator for the attribute (if applicable).
- c. Specify a value for the attribute (if applicable). Values are case-sensitive.
- d. If you need to specify multiple values or attributes, use the plus button to add multiple rows. For example, for the Classification attribute you might choose multiple Taxonomy names. If you specify multiple criteria, they are connected by the AND operator.

After you save the policy, you will see the generated list of services displayed on the Policy Detail page's **Services** profile.

Note: Keep the following in mind:

- If you specify no criteria, the policy will apply to all virtual services.
- You can specify only *one* "Name Equals <value>" condition. However, you can specify multiple "Name Contains <value>" or "Name Starts With <value>" conditions.

Caution: CentraSite checks for policy conflicts when you deploy a virtual service to Mediator. If the service has only one policy applied to it (the policy you are applying here), that policy is deployed to Mediator, and Mediator executes the policy's run-time actions in the order in which they appear in the policy. However, if the service already has additional policies applied to it, a policy conflict might occur, which might cause unintended consequences. CentraSite will inform you of policy conflicts. For information about how Mediator evaluates actions (and how to avoid policy conflicts), see "[Action Evaluation Order and Dependencies](#)" on page 337.

6. Click **Next**.
7. In the **Available Actions** dialog, select the built-in actions that you want to include in the policy. Keep the following points in mind when you select the actions for the policy:
 - If you are using webMethods Mediator as your PEP, you must include the "Identify Consumer" built-in action (and optionally other identification actions) in order to identify or authenticate consumers. For common usage cases of identification actions, see "[Usage Cases for Identifying/Authenticating Consumers](#)" on page 341.
 - Ensure that the actions in the **Selected Actions** list appear in the order in which you want them to run when the policy is enforced. If necessary, use the control buttons on the right side of the list to place them in the correct order.
8. Click **Finish** to save the new (as yet incomplete) policy. The Runtime Policy Detail page is displayed, showing details of the policy you just created.

9. Specify parameter values for each of the policy's actions as follows:
 - a. In the **Actions** profile, choose the action whose parameters you want to set.
 - b. In the **Edit Action Parameters** page, set the parameters as necessary and click **Save**. Required parameters are marked with an asterisk. For detailed information about the parameters, see ["Built-In Run-Time Actions Reference for Virtual Services" on page 333](#).
 - c. When you have finished setting the parameters of all actions in the list, click **Save** and then **Close**. The icons next to the actions in the **Parameters Set** column will indicate whether the action parameters have been set.

Icon	Description
	The action has required input parameters that have not yet been set.
	All of the action's required input parameters have been set.

Note: This icon automatically appears for actions that have no input parameters.

10. Complete the policy by doing the following:
 - a. If you want to allow other users to view, edit and/or delete this policy, go to the **Policy Detail** page, select the **Permissions** profile, and assign permissions to those users. You will not see this profile unless you belong to a role that has the Manage Runtime Policies permission. For procedures, see the *CentraSite Administrator's Guide*.
 - b. Activate the policy when you are ready to put it into effect. For procedures, see ["Activating a Run-Time Policy" on page 98](#).

Setting Permissions on a Run-Time Policy

If you want to permit other users to manage (i.e., view, edit and delete) run-time policies, you do so by adding to the policy's instance-level permission settings. A policy has the following types of instance-level permission settings.

Permission	Description
View	Enables users to see the policy in their policy list and view details for the policy.
Modify	Enables users to view and modify the properties of a policy (including the policy's scope and action list).

Permission	Description
Full	Enables users to view, modify or delete the policy.

Who Can Set Permissions on a Run-Time Policy?

To set permissions on a policy, you must belong to a role that has Manage Runtime Policies permission or the Manage System-wide Runtime Policies permission.

Assigning Permissions to a Run-Time Policy

You can assign view, edit and delete permissions to any individual user or group defined in CentraSite.

Note: If you give a user permission to view, edit or delete a policy, and you want that user to be able to perform these operations using CentraSite Control, make sure that the user belongs to a role that also has the Use the Policy UI permission.

To assign permissions to a policy

If you are modifying the permissions of an active policy, you must first deactivate the policy.

1. Display the Policy Detail page for the policy that you want to activate. If you need procedures for this step, see ["Modifying a Run-Time Policy" on page 101](#).
2. Select the **Permissions** profile.
3. To add a new a new user or group to the list, do the following:
 - a. Choose **Add Users / Groups**.
 - b. Select the users and/or groups to which you want to assign permissions.

If you type...	CentraSite will return...
b%	Groups and user names that start with the letter b.
b	Groups and user names that contain the letter b.
%b	Groups and user names that end with b.
%	All groups and user names.

If you want to filter the user list, specify a pattern-matching string in the **Search** field. The pattern-matching string can consist of one or more characters and/or the % wildcard symbol. The string is matched against group names and user IDs.

- c. Choose **OK**.
4. Use the **Full**, **Modify** and **View** check boxes to assign specific permissions to the users and groups in the list.
5. To remove an entry from the list, select the check box beside the group or user name and click **Delete**.
6. Click **Save** to save your settings.

Activating a Run-Time Policy

When you activate a run-time policy, CentraSite applies it to the services you specified in the policy.

To activate a policy, you change the policy's lifecycle state to the `Productive` state. This state change executes CentraSite's *Automatic Policy Activation* policy.

Note: The *Automatic Policy Activation* policy is a hidden system policy. You cannot edit or delete this policy.

When you activate a policy, be aware that:

- You will not be allowed to activate the policy unless all of its parameters have been set. When you switch the policy to the `Productive` state, CentraSite executes the *Validate Policy Activation* policy. This policy will not allow you to switch a policy to the `Productive` state if the policy's parameters have not yet been set.
- Some organizations require an approval to activate a policy. If your organization has an approval action associated with the activation of a policy, CentraSite will not activate the policy until the required approvals are obtained. For more information about approval actions, see the *CentraSite User's Guide*.
- To activate a policy, you must have permission to change the policy to the `Productive` state.
- To successfully change a policy to the `Productive` state, you must also have the `Modify` permission on all virtual type services to which the policy is applied.

To determine whether a policy is active or inactive, examine the policy's **Active** indicator on the **Policies > Run-Time** page. The icon in the **Active** column indicates the policy's activation state as follows:

Icon	Description
	Policy is active.
	Policy is inactive.

The activation state of a policy is also reported next to the **State** field in the Run-Time Policy Details page.

To activate a policy

1. Display the Run-Time Policy Details page for the policy you want to activate. If you need procedures for this step, see ["Modifying a Run-Time Policy" on page 101](#).
2. Examine the **Actions** profile and verify that all of the actions on this profile display the green checkmark icon in the **Parameters Set** column. If any of the actions display the red circle icon in this column, set their parameters before you continue. For information about setting action parameters, see ["Modifying Action Parameters" on page 104](#).
3. In the **Policy Information** panel, click the **Change State** button. (If you do not see the **Change State** button, it is probably because you do not have permission to change the lifecycle state of a policy.)
4. In the **Change Lifecycle State** dialog box, select the **Productive** lifecycle state and click **OK**.
5. Examine the **State** field in the **Policy Information** panel to verify that the policy's state has been changed.

If this state change requires approval, the **State** field will indicate that the policy is in the `pending` mode. CentraSite will automatically switch the policy to the requested state (and activate the policy) after all the necessary approvals have been obtained. For information about checking the status of objects that you have submitted for approval, see the *CentraSite User's Guide*.

Note: While the policy is in pending mode, it cannot be edited.

6. After you activate the policy, users with the proper permissions will deploy the services to your PEP. At that time, CentraSite will automatically validate the service's policies (e.g., check for policy conflicts or other violations). For information about how Mediator evaluates actions (and how to avoid policy conflicts), see ["Action Evaluation Order and Dependencies" on page 337](#).

Deactivating a Run-Time Policy

You usually deactivate a policy if you want to edit the policy (for example, to modify the scope of a policy or change its action list).

To deactivate a policy, you change the policy to the Suspended state. Switching the policy to this state triggers the *Automatic Policy Deactivation* policy, which deactivates the policy. (Switching the policy to the Retired state also deactivates the policy, but you do not want to switch a policy to this state unless you intend to deactivate it permanently. After you place a policy in the Retired state, you cannot reactivate it.)

To deactivate a policy, you must have permission to change the policy to the Suspended state.

To deactivate a policy

1. Display the Run-Time Policy Details page for the policy you want to activate. If you need procedures for this step, see ["Modifying a Run-Time Policy" on page 101](#).
2. In the **Policy Information** panel, click the **Change State** button. (If you do not see the **Change State** button, it is probably because you do not have permission to change the lifecycle state of a policy.)
3. In the **Change Lifecycle State** dialog box, select the **Suspended** state (to deactivate it temporarily) or the **Retired** state (to deactivate it permanently), then click **OK**

Viewing the Run-Time Policy List

The Run-Time Policies page displays a list of all run-time policies residing on the CentraSite server.

To view the policy list

1. In CentraSite Control, go to **Policies > Run-Time**.
2. By default, all of the available policies are displayed.

If you want to filter the list to see just a subset of the available policies, type a partial string in the **Search** field. CentraSite applies the filter to the **Name** column. The **Search** field is a type-ahead field, so as soon as you enter any characters, the display will be updated to show only those policies whose name contains the specified characters. The wildcard character % is supported.

3. You can sort the list by type of asset. To specify the sorting order, choose either **Web Service**, **REST Service**, **XML Service**, **Virtual Service**, **Virtual REST Service** or **Virtual XML Service** from the drop-down list labeled **Browse by**.

The Run-Time Policies page provides the following information about each policy.

Note: Only the first six columns described below are displayed in this list by default. To display the additional columns, click the **Select Columns** button.

Column	Description
Name	The name assigned to the policy.
Description	Additional comments or descriptive information about the policy.
System Version	The automatically generated system-assigned version identifier for the policy. For more information about system-assigned version identifiers, see, "System-Assigned vs. User-Assigned Version Identifiers" on page 108 .

Column	Description						
Organization	The organization to which the policy applies.						
	<table border="1"> <thead> <tr> <th>This value...</th> <th>Indicates that...</th> </tr> </thead> <tbody> <tr> <td>All</td> <td>The policy is system-wide and applies to all organizations.</td> </tr> <tr> <td><i>OrgName</i></td> <td>The policy applies to the specified organization.</td> </tr> </tbody> </table>	This value...	Indicates that...	All	The policy is system-wide and applies to all organizations.	<i>OrgName</i>	The policy applies to the specified organization.
This value...	Indicates that...						
All	The policy is system-wide and applies to all organizations.						
<i>OrgName</i>	The policy applies to the specified organization.						
State	The policy's current lifecycle state.						
Active	The policy's current enforcement state.						
	<table border="1"> <thead> <tr> <th>Icon</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>The policy is active. CentraSite enforces this policy when events within the scope of the policy occur.</td> </tr> <tr> <td></td> <td>The policy is inactive. Inactive policies exist in the registry, but they are not enforced.</td> </tr> </tbody> </table>	Icon	Description		The policy is active. CentraSite enforces this policy when events within the scope of the policy occur.		The policy is inactive. Inactive policies exist in the registry, but they are not enforced.
Icon	Description						
	The policy is active. CentraSite enforces this policy when events within the scope of the policy occur.						
	The policy is inactive. Inactive policies exist in the registry, but they are not enforced.						
Version	The user-assigned version identifier for the policy. For more information about user-assigned version identifiers, see, " System-Assigned vs. User-Assigned Version Identifiers " on page 108.						
Owner	The user to which the policy belongs.						

Modifying a Run-Time Policy

Viewing or Changing a Run-Time Policy

You use the Run-Time Policy Details page to examine and/or edit the properties for a policy. When editing a policy, keep the following points in mind:

- To edit a policy, you must have Modify permission on the policy. If your user account belongs to a role that has the Manage Runtime Policies permission for an organization, you automatically have permission to modify all of the policies in that organization. If your user account belongs to a role that has the Manage System-

Wide Runtime Policies permission, you have permission to edit any system-wide policy on the server.

- You cannot make changes to a run-time policy while it is active. To make changes to an active policy, you must switch the policy to the Suspended state (to deactivate it), update the policy and then switch it back to the Productive state (to reactivate it). For information about deactivating and activating a policy, see ["Deactivating a Run-Time Policy" on page 99](#) and ["Activating a Run-Time Policy" on page 98](#), respectively.

To edit a policy

1. In CentraSite Control, go to **Policies > Run-Time** to display the policy list.
2. Locate the policy whose details you want to view or edit and choose **Details** from its context menu.
3. Examine or modify the properties on the **Policy Detail** page as necessary.

Field or Profile	Description						
Name	The name of the policy. A policy name can contain any character (including spaces).						
Description	<i>Optional.</i> Additional comments about the policy.						
Version	The user-defined version number to be assigned to the new version. We recommend that you update the version number anytime you make significant modifications to a policy. The usage of this field is the same as described in "Creating a Run-Time Policy" on page 93 .						
State	The policy's current lifecycle state (e.g., New, Productive, Suspended, Retired). This field also displays an icon that indicates the activation state of the policy:						
	<table border="1"> <thead> <tr> <th style="text-decoration: underline;">Icon</th> <th style="text-decoration: underline;">Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>The policy is active (i.e., ready to be deployed to a PEP).</td> </tr> <tr> <td></td> <td>The policy is inactive.</td> </tr> </tbody> </table>	Icon	Description		The policy is active (i.e., ready to be deployed to a PEP).		The policy is inactive.
Icon	Description						
	The policy is active (i.e., ready to be deployed to a PEP).						
	The policy is inactive.						
Organization	The organization to which the policy belongs.						
Owner	The user who created the policy.						

Field or Profile	Description
System Version	The automatically-generated system version identifier for the policy. For more information, see "Creating a Run-Time Policy" on page 93 .
Actions profile	The settings in this profile specify the actions that the PEP will execute when the policy is enforced. For more information about the properties on this profile, see "Creating a Run-Time Policy" on page 93 .
Scope profile	The settings in this profile determine the services to which the policy is applied. For more information about the properties on this profile, see Modifying the Scope of a Run-Time Action .
Services profile	Displays the list of Web services and/or virtual services to which the policy applies. For more information, see Viewing the List of Services To Which a Run-Time Policy Applies .
Permissions profile	The settings in this profile identify which users can view, edit and/or delete the policy. For more information about the properties on this profile, see "Setting Permissions on a Run-Time Policy" on page 96 .

4. If you edited the settings on the **Run-Time Policy Details** page, click **Save** to save the updated policy.
5. If you deactivated the policy in order to edit it, activate the policy as described in ["Activating a Run-Time Policy" on page 98](#).

You can view the details page of multiple policies as follows:

To view the details page of multiple policies

1. In CentraSite Control, go to **Policies > Run-Time** to display the policy list.
2. Locate the policies whose details you want to view, and mark their checkboxes.
3. In the **Actions** menu, choose **Details**.

The details page of each of the selected policies will now be displayed.

Modifying Actions for a Run-Time Policy

Modifying the Actions List

Use the procedure in this section to modify the actions list.

To modify the actions list

1. Display the **Policy Detail** page for the policy whose actions you want to edit. If you need procedures for this step, see ["Modifying a Run-Time Policy" on page 101](#).
2. If the policy is active, deactivate it. You cannot modify an active policy. If you need procedures for this step, see ["Deactivating a Run-Time Policy" on page 99](#).
3. Select the **Actions** profile to display the list of actions associated with the policy.
4. To add actions to, delete actions from, or modify the order of actions in the list, do the following:
 - a. Click **Edit Actions List**.
 - b. Use the controls in the **Edit Assigned Actions List** dialog box to add actions to the list and/or delete actions from the list.

When editing the list of actions, keep the following point in mind:

- If you are using webMethods Mediator as your PEP, you must include the built-in run-time action "Identify Consumer" (and possibly other authorization/identification actions) in order to identify or authenticate consumers. For common usage cases of identification actions, see ["Usage Cases for Identifying/Authenticating Consumers" on page 341](#).
 - If necessary, you can click **Previous** to return to the previous page and modify the information in the **Policy Information** panel.
- c. Make sure that the actions in the **Selected Actions** list appear in the order that you want them to run when the policy is enforced. If necessary, use the control buttons on the right side of the list to place them in the correct order.
 - d. Click **OK** to save the modified list.
5. Use the procedure in ["Modifying Action Parameters" on page 104](#) to specify parameter values for any new actions that you might have added to the list, or to make any necessary updates to the parameter values for existing actions.
 6. When the action list is complete and you have configured all of the input parameters for the actions correctly, click **Save** to save the updated policy.
 7. If you deactivated the policy in order to edit it, activate the policy as described in ["Activating a Run-Time Policy" on page 98](#).

Modifying Action Parameters

Policy actions have parameters that you set to configure the behavior of the action at enforcement time. When you display the **Actions** profile on the Policy Detail page, the icon in the **Parameters Set** column indicates whether an action has input parameters that need to be set.

This icon...	Indicates that...
	The action has required input parameters that have not yet been set.
	All of the action's required input parameters have been set.

Note: This icon automatically appears for actions that have no input parameters.

Until the green check mark icon appears for all actions, you will not be able to activate the policy (if it is inactive) or save the policy (if it is already active).

To modify action parameters

1. Display the **Policy Detail** page for the policy whose actions you want to edit. If you need procedures for this step, see ["Modifying a Run-Time Policy" on page 101](#).
2. If the policy is active, deactivate it. You cannot modify an active policy. If you need procedures for this step, see ["Deactivating a Run-Time Policy" on page 99](#).
3. In the **Actions** profile do the following for each action in the list.
 - a. Choose the action whose parameters you want to examine or set.
 - b. In the **Edit Action Parameters** page, set the parameters as necessary.

Note: Required parameters are marked with an asterisk. For more information about built-in actions and their parameters, see ["Built-In Run-Time Actions Reference for Virtual Services" on page 333](#).

- c. Click **Save** to save the parameter settings.
4. After you configure the parameters for all of the actions in the list, click **Save** to save the updated policy.
 5. If you deactivated the policy in order to edit it, activate the policy as described in ["Activating a Run-Time Policy" on page 98](#).

Modifying the Scope of a Run-Time Action

You can use the **Scope** profile on the Run-Time Policy Detail page to modify a policy's scope.

Note: Once you create a policy, its organizational scope is fixed and cannot be changed. That is, if you create a policy whose scope is specific to organization ABC, you cannot change its scope to make it system-wide or switch it to another organization. You must create a new policy and set its organizational scope as needed.

To modify the scope of a run-time policy

1. Display the Policy Detail page for the policy that you want to edit. If you need procedures for this step, see ["Modifying a Run-Time Policy" on page 101](#).
2. If the policy is active, deactivate it. You cannot modify an active policy. If you need procedures for this step, see ["Deactivating a Run-Time Policy" on page 99](#).
3. In the **Scope** profile, you can modify the following fields.

Field or Profile	Description
Target Type	The target type to which the policy will be deployed (e.g., webMethods Integration Server).
Asset Type	The type(s) of assets to which this policy applies. Note: CentraSite does not provide out-of-the-box policy-enforcement for web services.
Organization	Read-only field. You cannot change the policy's organization after the policy has been created.
Apply Policy to Services that Meet the Following Criteria	<p>The services to which the policy applies.</p> <ul style="list-style-type: none"> ■ Choose an attribute (e.g., Name, Description, Classification) that identifies the services to which the policy applies. ■ Choose an appropriate operator. ■ Specify a value. ■ If you need to specify multiple criteria, use the plus button to add multiple rows. For example, for the Classification attribute you might choose multiple Taxonomy names. After you save the policy, you will see the generated list of services displayed on the Policy Detail page's Services profile. <p>Note: If you specify multiple criteria, the criteria are connected with the AND operator. That means that <i>all</i> criteria must be satisfied, in order for the policy to apply to any of the services. If not all the criteria are satisfied, the policy will not apply to any of the services.</p>

4. Click **Save** to save the modified policy.

5. If you deactivated the policy in order to edit it, activate the policy as described in ["Activating a Run-Time Policy" on page 98](#).

Viewing the List of Services To Which a Run-Time Policy Applies

Use the following procedure to view the list of services to which a run-time policy applies.

Important: The list only includes services that are in the “deployable state” (that is, services whose deployment state has been enabled by the Change Deployment State action in a design-time policy). Services that are within the scope of the policy, but have not yet been made “deployable”, do not appear in this list.

To view the list of services

1. Display the Policy Detail page for the policy that you want to view. If you need procedures for this step, see ["Viewing or Changing a Run-Time Policy" on page 101](#).
2. Select the **Services** profile to view the list of virtual services and/or Web services that was generated based on the criteria you specified in the **Scope** profile.
3. To view details of a service, click its hyperlinked name.

Note: To add or remove services to or from the list, return to the **Scope** profile and change the criteria in the **Apply Policy to Services that meet the following Criteria** panel. For more information, see the procedure in [Modifying the Scope of a Run-Time Action](#).

Deleting a Run-Time Policy

You delete a policy to remove it from CentraSite permanently.

CentraSite is installed with a system-wide policy called *Check State Validation Policy for Policy*. This policy will not allow you to delete a policy unless the policy is in the New or Retired state.

To delete a policy

1. In the CentraSite Control, go to **Policies > Run-Time** to display the policy list.
2. Ensure that the policy is deactivated (see ["Deactivating a Run-Time Policy" on page 99](#)).
3. Enable the checkbox next to the name of the policy that you want to delete.
4. Click **Delete**.

You can delete multiple policies in a single step. The rules described above for deleting a single policy apply also when deleting multiple policies.

To delete multiple policies in a single operation

1. In CentraSite Control, go to **Policies > Run-Time** to display the policy list.
2. Mark the checkboxes of the policies that you want to delete.
3. From the **Actions** menu, choose **Delete**.

System-Assigned vs. User-Assigned Version Identifiers

CentraSite maintains two version identifiers for a policy: a *system-assigned identifier* and a *user-assigned identifier*.

- The system-assigned identifier is a version number that CentraSite maintains for its own internal use. CentraSite automatically assigns this identifier to a policy when the policy is created. You cannot delete it or modify it. A policy's system-assigned identifier is numeric.

A policy's system-assigned version number is shown in the **System Version** column on the Run-Time Policies page and in the **System Version** field of the policy's detail page.

- The user-assigned identifier is an optional identifier that you can assign to a distinguish a specific version of a policy. This identifier does not need to be numeric. For example, you might use a value such as "V2.a (beta)" to identify a version.

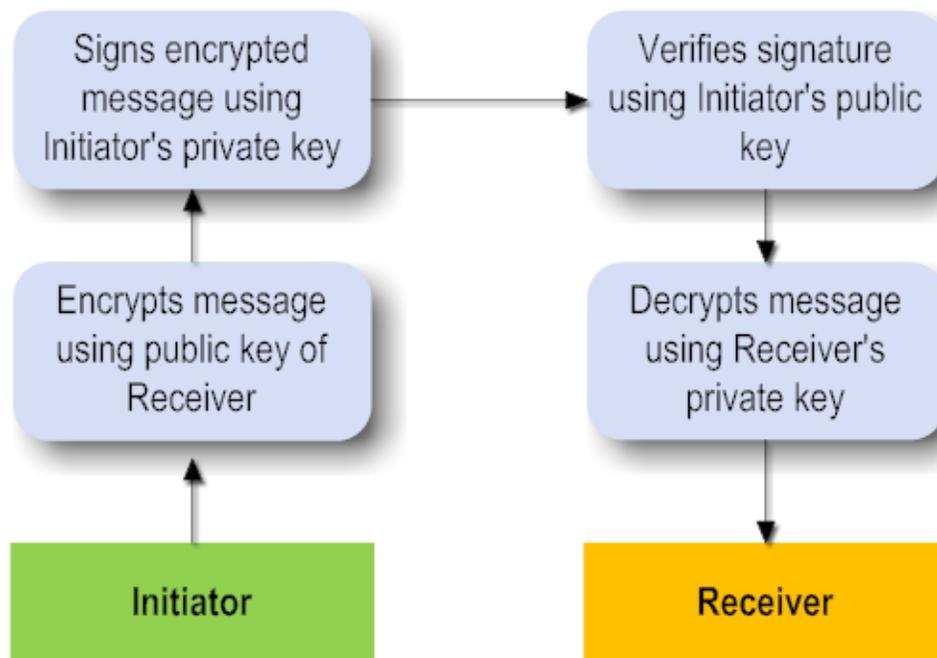

A policy's user-assigned version number is shown in the **Version** column on the Run-Time Policies page and in the **Version** field of the policy's detail page.

Asymmetric Binding Configuration

WS-SecurityPolicy specification deals with three types of Security Bindings. A security binding determines how the message transfer is to be done between the recipient and the initiator.

Asymmetric Binding

Asymmetric Binding is used when both the Initiator and the Recipient possess public and private keys. The message transfer takes place using Public Key Infrastructure.

An Asymmetric Binding element in the WSDL looks like this:

```

<sp:AsymmetricBinding
xmlns:sp="http://schemas.xmlsoap.org/ws/2005/07/securitypolicy">
  <wsp:Policy>
    <sp:InitiatorToken>
    </sp:InitiatorToken>
    <sp:RecipientToken>
    </sp:RecipientToken>
    <sp:AlgorithmSuite>
      <wsp:Policy>
        <sp:TripleDesRsa15/>
      </wsp:Policy>
    </sp:AlgorithmSuite>
    <sp:Layout>
      <wsp:Policy>
        <sp:Strict/>
      </wsp:Policy>
    </sp:Layout>
    <sp:IncludeTimestamp/>
    <sp:OnlySignEntireHeadersAndBody/>
  </wsp:Policy>
</sp:AsymmetricBinding>
  
```

The following run-time actions that support WS-Security policies use a common Asymmetric Binding element:

- The “Require Encryption” action.
- The “Require Signing” action.
- The “Require WSS SAML Token” action.
- The “Require WSS X.509 Token” action.

The Asymmetric Binding Components

The components of a security binding are as described below.

Initiator Token Inclusion

The value of Initiator Token Inclusion specifies how to include the initiator token during message exchange from Initiator to Recipient or Recipient to Initiator.

Value	Description
Always	Always include the token.
AlwaysToRecipient	Include the token in all message exchanges from the Initiator to Recipient.
AlwaysToInitiator	Include the token in all message exchanges from the Recipient to Initiator.
Once	Only once.
Never	Do not include the token in any communications.

Recipient Token Inclusion

The value of Recipient Token Inclusion specifies how to include the Recipient token during message exchange from Initiator to Recipient or Recipient to Initiator. It takes the same values as Initiator Token Inclusion above.

Algorithm Suite

The value of Algorithm Suite specifies the algorithm suite to be used for this asymmetric binding. The possible algorithms supported are:

- Basic 256
- Basic192
- Basic128
- TripleDes
- Basic256Rsa15
- Basic192Rsa15
- Basic128Rsa15
- TripleDesRsa15

- Basic256Sha256
- Basic192Sha256
- Basic128Sha256
- TripleDesSha256
- Basic256Sha256Rsa15
- Basic192Sha256Rsa15
- Basic128Sha256Rsa15

Layout

Layout describes the way information is added to the message header. The possible values are:

Value	Description
Strict	Items are added to the security header in a principle of "declare before use".
Lax	Items are added to the security header in any order that conforms to WSS: SOAP Message Security.
LaxTsFirst	Same as Lax except that the first item in the security header <i>must</i> be a <code>wsse:Timestamp</code> . Note that the <code>wsse:Timestamp</code> property <i>must</i> also be set to true in this case.
LaxTsLast	Same as Lax except that the last item in the security header <i>must</i> be a <code>wsse:Timestamp</code> . Note that the <code>wsse:Timestamp</code> property <i>must</i> also be set to true in this case.

The Asymmetric Binding Configuration Command Tool

You can change the Asymmetric Binding configuration by executing the following commands in the command line interface `CentraSiteCommand.cmd` (Windows) or `CentraSiteCommand.sh` (UNIX) of CentraSite. The tool is located in `<CentraSiteInstallDir>/utilities`.

If you start this command line tool with no parameters, you receive a help text summarizing the required input parameters.

The parameters of the command are case-sensitive, so for example the parameter `-url` must be specified as shown and not as `-URL`.

The configuration is maintained in the form of an XML file which is loaded with default values.

```
<?xml version="1.0" encoding="UTF-8" ?>
<AsymmetricBindingConfiguration>
<initiatorTokenInclusion>AlwaysToRecipient</initiatorTokenInclusion>
<recipientTokenInclusion>Never</recipientTokenInclusion>
<algorithmSuite>TripleDesRsa15</algorithmSuite>
<layout>Strict</layout>
</AsymmetricBindingConfiguration>
```

The commands include:

- ["get Asymmetric Binding" on page 112](#)
- ["set Asymmetric Binding" on page 112](#)
- ["remove Asymmetric Binding" on page 113](#)

get Asymmetric Binding

Use this command to obtain the current Asymmetric binding configuration values. Use a command of the following format:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd get Asymmetric
Binding [-url <CENTRASITE-URL>] -user <USER-ID>-password <PASSWORD>
```

The following table describes the complete set of input parameters that you can use with the `get Asymmetric Binding` utility:

Input Parameter	Description
<code>-url</code>	The fully qualified URL (<code>http://localhost:53307/CentraSite/CentraSite</code>) for the CentraSite registry/repository.
<code>-user</code>	The user ID of a user who has the CentraSite Administrator role.
<code>-password</code>	The password of the user identified by the parameter <code>-user</code> .

For example:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd get Asymmetric
Binding [-url "http://localhost:53307/CentraSite/CentraSite"] -user
"Administrator" -password "manage"
```

set Asymmetric Binding

Use this command to change the values in the CentraSite registry/repository.

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd set
Asymmetric Binding [-url <CENTRASITE-URL>] -user <USER-ID> -
password [-initiatorTokenInclusion <INITIATOR-TOKEN-INCLUSION>] [-
```

```
recieipientTokenInclusion <RECIPIENT-TOKEN-INCLUSION> [-algorithmSuite
<ALGORITHM-SUITE>] [-layout <LAYOUT>]
```

The following table describes the complete set of input parameters that you can use with the set Asymmetric Binding utility:

Input Parameter	Description
-url	The fully qualified URL (http://localhost:53307/CentraSite/CentraSite) for the CentraSite registry/repository.
-user	The user ID of a user who has the CentraSite Administrator role.
-password	The password of the user identified by the parameter -user.
-initiatorTokenInclusion	Inclusion value for the Initiator Token. *
-recipientTokenInclusion	Inclusion value for the Recipient Token. *
-algorithmSuite	The algorithm to be used. *
-layout	The layout to be used. *

* At least one of the following parameters is required: initiatorTokenInclusion, recipientTokenInclusion, algorithmSuite and layout.

remove Asymmetric Binding

Use this command to remove the Asymmetric Binding configuration. It has the same parameters as the get Asymmetric Binding command:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd remove
Asymmetric Binding [-url <CENTRASITE-URL>] -user <USER-ID> -password
<PASSWORD>
```

The following table describes the complete set of input parameters that you can use with the remove Asymmetric Binding utility:

Input Parameter	Description
-url	The fully qualified URL (http://localhost:53307/CentraSite/CentraSite) for the CentraSite registry/repository.
-user	The user ID of a user who has the CentraSite Administrator role.

Input Parameter	Description
<code>-password</code>	The password of the user identified by the parameter <code>-user</code> .

For example (all in one line):

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd remove
Asymmetric Binding [-url "http://localhost:53307/CentraSite/CentraSite"]
-user "Administrator" -password "manage"
```

Consumer Applications

A consumer application is a computer application that consumes (invokes) assets (services, BPEL processes or XML schemas) at run time. Typically, you create consumer applications to specify the consumers that are allowed to consume a particular asset. Then, you include the consumer application in the **Consumers** profile of the asset.

A consumer application in CentraSite is represented by an *Application* as webMethods Mediator set. The Application asset defines the precise consumer identifiers (for example, a list of user names in HTTP headers, a range of IP addresses, etc.). Thus the policy enforcement point (such as) can identify or authenticate the consumers that are requesting an asset.

You can use Application assets with any supported policy enforcement point (that is, webMethods Mediator or any supported third-party policy enforcement point).

Note: If you want to authenticate consumers (using LDAP or another external authentication mechanism), make sure that your policy enforcement point is configured to enable authentication. For information, see the documentation for your policy enforcement point.

The following subsections describe how to create and manage consumer applications:

Who Can Create and Manage Consumer Applications?

To create and manage consumer applications, you must belong to a role with the following permissions:

- Create Assets —OR— Manage Assets
- Manage Lifecycle Models (required to change state of consumer applications)

For more information about roles and permissions, see *Getting Started with CentraSite*.

Identifying Consumer Applications

To identify consumer applications, you perform the following high-level steps:

1. Include the Identify Consumer action in the asset's run-time policy.

To identify the consumer applications that are requesting an asset, that asset must have a run-time policy that includes the Identify Consumer action. In this action, you specify the consumer identifier(s) you want to use for identifying consumer applications. (Alternatively, you may configure this action to allow unrestricted access.) This action extracts the specified identifier from an incoming request and locates the consumer application defined by that identifier.

For example, if you configure the Identify Consumer action to identify consumers by IP address, the PEP extracts the IP address from a request's HTTP header at run time and searches its list of application assets for the application that is defined by that IP address.

You can configure the Identify Consumer action to identify consumer applications based on one or more of the following consumer identifiers in a request message:

Consumer Identifier	Description
IP Address	The IP address from which the request originated.
Host Name	The name of the host machine from which the request originated.
HTTP Authentication Token	The user ID submitted by the requestor when it was asked to provide basic HTTP credentials (user name and password).
WS-Security Authentication Token	The WSS username token supplied in the header of the SOAP or XML request that the consumer application submitted to the virtualized service.
Custom Identification	A string produced by applying a specified XPath expression to the SOAP or XML request that the consumer application submitted to the virtualized service.
Consumer Certification	The X.509 certificate supplied in the header of the SOAP or XML request that the consumer application submitted to the asset.
Client Certificate for SSL Connectivity	The client's certificate that the consumer application submits to the asset. The certificate is supplied during the SSL handshake over the Transport layer. Communication between the client and the asset must be over HTTPS.

When deciding which type of identifier to use to identify a consumer application, consider the following points:

- Whatever identifier you choose to identify a consumer application, it must be unique to the application. Identifiers that represent user names are often not suitable because the identified users might submit requests for multiple applications.
- Identifying applications by IP address or host name is often a suitable choice, however, it does create a dependency on the network infrastructure. If a consumer application moves to a new machine, or its IP address changes, you must update the identifiers in the application asset.
- Using X.509 certificates or a custom token that is extracted from the SOAP or XML message itself (using an XPATH expression), is often the most trouble-free way to identify a consumer application.

For more information about the Identify Consumer action, see ["Built-In Run-Time Actions Reference for Virtual Services" on page 333](#) and ["Usage Cases for Identifying/Authenticating Consumers" on page 341](#).

2. **Create an application asset in the registry.**

In the application asset you specify precise values for the consumer identifier(s) that you specified in the Identify Consumer action. For details, see ["Creating a Consumer Application" on page 117](#).

3. **Specify the application asset in the Consumers profile of the asset to be consumed.**

The Consumers profile is located in the asset's detail page.

The run-time behavior of identifying consumers is as follows:

1. CentraSite translates the application asset to the appropriate WS-Security policy assertions or an equivalent XML when the application asset is enforced by the PEP.
2. When a consumer application requests access to an asset, the PEP tries to map the consumer's identifier (which is found in the request) to an identifier in the application asset.
 - If the identifier is an IP address, a host name, a custom identification string or a consumer certificate, the PEP tries to identify the consumer (the consumer is not authenticated).
 - If the identifier is an HTTP Authentication token or a WS-Security Authentication token, the PEP tries to *authenticate* the consumer. If you use webMethods Mediator, authentication is handled by LDAP or by another external authentication mechanism, depending on how Mediator is configured. If you use a third-party PEP, authentication capabilities depend on the PEP.
3. The identified or authenticated consumer information is published back to the registry as part of the transaction or other events. This information is used to correlate the consumer-specific run-time dependencies.

Creating a Consumer Application

Use the following procedure to create a consumer application asset.

To create a consumer application asset

1. In CentraSite Control, go to **Asset Catalog > Browse**.
2. Click **Add Asset(s)**.
3. In the Add Asset dialog, enter values for the following fields:

In this field...	Specify...
Type	The Application asset type.
Name	A name for the application asset. An asset name can contain any character (including spaces).
Description	<i>Optional.</i> A comment or descriptive information about the new application asset.
Organization	The organization to which the application asset belongs.
Initial Version	<p><i>Optional.</i> An identifier for the initial version of the application asset. The default is 1.0, but you can use any versioning scheme you choose. The version identifier does not need to be numeric. Examples:</p> <pre>0.0a 1.0.0 (beta) Pre-release 001 v1-2007.04.30</pre> <p>You can later create new versions of the application asset (see <i>CentraSite User's Guide</i>).</p>

4. Click **OK**.
Now the detail page of the newly created asset opens. Here you can enter the values of various attributes of the new asset.
5. Configure the profiles of the detail page, as described in the following sub-sections.
6. If you belong to a role that has the Register as Consumer permission, the entry **Register as Consumer** is enabled in the **Actions** menu of the details page. If you select this menu entry, a dialog opens that lets you select users, groups and consumer applications that can use this asset. The request must be subsequently approved or rejected by the owner of the asset.

7. Specify the application asset in the Consumers profile of the asset to be consumed. To do this, open the detail page of the asset to be consumed and specify the application asset the **Consumers** profile.

Configuring the Profiles of a Consumer Application

Configuring the Identification Profile

In this profile, specify the precise values for the consumer identifier(s) that you specified in the Identify Consumer action.

Note: Keep the following in mind:

- If you specify *multiple* identifiers, the system evaluates them with the identifier defined in the Identify Consumer action.
- If you want to authenticate consumers, make sure that your policy enforcement point is configured to enable authentication. For information, see the webMethods Mediator documentation or the documentation for your third-party PEP.

To configure the Identification profile

- Specify values for one or more of the following fields.

Note: The value(s) that you specify in the Identification profile depend on how the run-time policy's Identify Consumer is configured. For example, if Identify Consumer is configured to identify consumers by their IP address, you should specify the consumer IP addresses here. For information about this action, see the ["Built-In Run-Time Actions Reference for Virtual Services"](#) on page 333.

In this field...	Do the following...
IPv4 Address	<p>Identify consumers based on their originating 4-byte IP address.</p> <p>Use this field when the Identify Consumer action is configured to identify consumer applications by IP address.</p> <ul style="list-style-type: none"> ■ To specify an individual IP address, type the address in the From field. The application asset will identify only those requests that originate from the specified IP address. ■ To specify a range of IP addresses, type the lowest IP address in the From field and the highest IP address in the To field. For example, the values 192.168.0.0 and 192.168.0.10 indicates that requests originating from any IP address that

In this field...	Do the following...
	<p>lies between the specified range will be identified by the application asset.</p> <p>If you need to specify additional IP addresses, use the plus button to add more rows.</p>
IPv6 Address	<p>As for IPv4 Address, but using the 128-bit IPv6 format. For example: 1234:5678:9ABC:DEF0:1234:5678:9ABC:DEF0.</p>
Identification Token	<p>Identify consumers based on one or more of the following kinds of identification tokens:</p> <p>Use this field when the Identify Consumer action is configured to identify consumer applications by host name, HTTP user name, WSS user name or a custom token.</p> <ul style="list-style-type: none"> <li data-bbox="581 825 1396 993">■ Host Name—To identify consumers based on a specified host name, type the host name (for example, pcmachine.ab.com) in the Name field. The application asset will identify only those requests that originate from the specified host name. <li data-bbox="581 1014 1396 1423">■ HTTP Authentication Token—To authenticate consumers based on the user name that is transmitted in an HTTP authentication user token, type the user name (for example, testuser123) in the Name field. The application asset will identify only the requests that contain the specified user name encoded and passed in the HTTP authentication user token. Authentication is handled by LDAP or another external authentication mechanism. You can specify the kinds of HTTP headers that Mediator will pass from requests to services. The default is the Authorization header. To configure Mediator to pass other kinds of HTTP headers, see the Mediator documentation. <li data-bbox="581 1476 1396 1738">■ WS-Security Authentication Token—To authenticate consumers based on the user name that is transmitted in the SOAP or XML message header (HTTP body), type the user name (for example, userwss) in the Name field. The application asset will identify only the requests that contain the specified user name passed in the SOAP or XML message header. Authentication is handled by LDAP or another external authentication mechanism. <li data-bbox="581 1770 1396 1890">■ Custom identification token (XPath)—To identify consumers based on the result of applying an XPath expression on the SOAP or XML message or request, enter the XPath expression in the Name field. For example,

In this field...	Do the following...
	<p>typing <code>//*[local-name()='Envelope']//*[local-name()='Body']//*[local-name()='echoInt']//*[local-name()='echoIntInput='][.='2']</code> in the Name field will identify the requests that contain the XPath and the consumers.</p> <p>If you need to specify additional tokens, use the plus button to add more rows.</p>
Consumer Certificate	<p>Identify consumers based on information in an X.509 v3 certificate.</p> <p>Use this field when the Identify Consumer action is configured to identify consumer applications by a consumer certificate.</p> <p>Click Browse to locate the certificate (.cer) file and select the certificate file.</p>

Configuring the Permissions Profile

Use this profile to set permissions for the application asset. For information, see the *CentraSite User's Guide*.

Configuring the Versions Profile

Use this profile to generate a new version of the application asset. For information, see the *CentraSite User's Guide* in.

Configuring the Subscriptions Profile

Optional. If you want to be notified when the application asset is changed, click the **Actions** button and select **Notify me** from the drop-down list. Your owner name will appear in the **Subscriptions** profile. Any other users who have permission to access the asset can add their own user names to this list.

Viewing the Audit Log Profile

This profile displays an audit log of the changes made to the application asset (including changes in an asset's lifecycle state).

Configuring the Object-Specific Properties Profile

Optional. Use this profile to add object-specific properties to the application asset.

To configure the Object-Specific Properties tab

1. Click the **Add Property** button.

- Specify values for the following fields:

<u>In this field...</u>	<u>Specify...</u>
Name	The name of the property.
Namespace	<i>Optional</i> The namespace of the property.
Values	<i>Optional</i> A value for the property. If you want to specify multiple values, use the plus button to add additional rows.

Editing a Consumer Application

Use the following procedure to edit the attributes associated with a consumer application asset in the catalog.

When editing attributes, keep the following general points in mind:

- If you are not the owner of the asset, you cannot edit the asset unless you have Modify permission on the asset (granted through either a role-based permission or an instance-level permission).
- When you view the details for the asset, you will only see profiles for which you have View permission. You will only be able to edit the profiles on which you have Modify permission.

To edit the attributes for a consumer application asset

- In CentraSite Control, go to **Asset Catalog > Browse**.
- On the Browse page, perform a keyword or advanced search to display the application asset(s). For procedures, see the *CentraSite User's Guide*.
- Locate the application asset whose details you want to view and, from its context menu, select **Details**.
- To edit the application asset's **Name**, **Description** or user-defined version number, place the cursor in the appropriate field and modify the text as required.
- To modify the extended attributes associated with the asset, do the following:
 - Select the profile that contains the attribute(s) that you want to modify.
 - Edit the attributes on the profile as necessary.

Note: If at any time you want to abandon your unsaved edits, click **Close**. CentraSite will ask you if you want to save your edits. Click **No** to abandon your edits and return the asset's attributes to their previous settings.

- When you have finished making your edits, click **Save**.

Deploying a Consumer Application

You can deploy consumer application assets to a policy enforcement point (such as Mediator) in either of the following ways:

- **From the Operations > Deployment page**

You can deploy multiple consumer applications to Mediator in a single step.

- **Running a script file from a command line**

You can run a script file to deploy multiple consumer applications to Mediator in a single step

For more information, see "[Deploying, Undeploying and Redeploying Consumer Applications](#)" on page 144.

Deleting a Consumer Application

Before you delete an application asset, we strongly recommend that you examine the asset's **Impact Analysis** profile to determine whether other assets will be affected by the asset's deletion.

How to Delete a Consumer Application

The following procedure describes how to delete a single consumer application.

To delete a consumer application

1. In CentraSite Business UI, display the details page for the API that you want to delete.
2. From the **Actions** menu, choose **Delete**.

When you are prompted to confirm the delete operation, click **OK**.

Consumer application is permanently removed from the CentraSite registry/repository.

How to Delete Multiple Consumer Applications in a Single Operation

You can delete multiple application assets in a single step. The rules described above for deleting a single application asset apply also when deleting multiple application assets.

Important: If you have selected several application assets where one or more of them are predefined application assets, you can use the **Delete** button to delete the assets. However, as you are not allowed to delete predefined application assets, only assets you have permission for will be deleted. The same applies to any other application assets for which you do not have the required permission.

To delete multiple application assets in a single operation

1. In CentraSite Control, use either the Browse or the Search feature in the asset catalog to select a list of the application assets. If you need information on how to browse or search the asset catalog, see the *CentraSite User's Guide*.
2. Mark the checkbox of each application asset you want to delete.
3. From the **Actions** menu, choose **Delete**.

When you are prompted to confirm the delete operation, click **OK**.

Each selected consumer application is permanently removed from the CentraSite registry/repository.

Consumer Provisioning and Consumer-Provider Relationship Tracking

The term *consumer provisioning* means providing users with the ability to consume assets. Consumer provisioning with CentraSite enables you to control and monitor who consumes assets.

A consumer can be any of the following:

- A registered user of CentraSite.
- A registered group of users.
- A guest user.
- A consumer who is identified in an application asset. For more information, see ["Creating a Consumer Application" on page 117](#).

To control who consumes assets, you:

- **Register users to consume assets.**

CentraSite users with the proper permissions can register themselves or other users as consumers of specified assets. That is, users can request permission to access specified assets in the registry. The owners of the assets may approve or reject such requests.

- **Specify the registered consumers in the asset's Consumers profile.**

After users, groups and/or applications are approved to consume an asset, you must specify those consumers in the asset's Consumers profile. The Consumers profile appears in the asset's detail page.

Because consumers are registered, CentraSite can easily track consumer-provider relationships. The purpose of tracking consumer-provider relationships is to identify:

- The artifacts in the registry that will be affected if an asset is not available or must be changed.
- The organizations that need to be informed in such situations.

You can track consumer-provider relationships in the following ways:

- **View pending registrations.**

If you are the owner of an asset, and another user has made a request to register as a consumer of the asset, you can view the request (see [Viewing Consumer Registration Requests](#)).

- **View your registration requests.**

If you have made a request to register as a consumer of an asset owned by another user, you can view the status of the request (see ["Viewing Consumer Registration Requests" on page 126](#)).

- **Generate reports on consumer-provider relationships.**

See *CentraSite User's Guide*.

- **Inspect the "Impact Analysis" view of the assets.**

You can view associations between the registry objects to identify the impact when updating or deleting an asset in the catalog. For more information, see the *CentraSite User's Guide*.

Implementing Consumer Provisioning

To provide consumers with access to assets, you perform the tasks as described below.

Creating the Consumer-Provider Relationship Policy

To enable users to register as consumers of assets, you must first create a policy that enables the asset owners to approve or reject the "Register as Consumer" requests. To create the policy, use this procedure.

To create the Consumer-Provider Relationship Policy

1. Create a Design/Change-Time policy with the following specifications:

Field	Value
Name	Consumer-Provider Relationship Policy
Object Type	Assets
Event Type	OnConsumerRegistration
Actions	<ul style="list-style-type: none"> ■ Initiate Approval ■ Register Consumer ■ Set Consumer Permission

If you need instructions for creating a Design/Change-Time policy, see the *CentraSite User's Guide*. For more information about setting the action parameters, see the *CentraSite Developer's Guide*.

When you register users to consume assets (as described in "[Registering Users to Consume Assets](#)" on page 125), the policy is triggered and the "Register as Consumer" request is submitted to all members of the approval list specified in the Initiate Approval action. Then, the approvers can either approve or decline the request. If the approvers approve the request, the consumers will be registered as consumers, and appropriate permissions will be assigned to users and groups (permissions are not applicable to application consumers).

Registering Users to Consume Assets

If you have permissions to view assets in the catalog, and you belong to a role that includes the Register as Consumer permission, the **Register as Consumer** feature is enabled in the **Actions** menu when you browse or search the asset catalog in CentraSite Control. This feature opens a dialog that lets you request the right to be a consumer of one or more of the displayed assets. You can request the right for yourself, or for any user or group in any organization, or for any consumer application owned by any organization.

The request must be subsequently approved or rejected for each asset by at least one of the owners of the asset. This functionality is also available in the detail view of an asset by choosing the **Register as Consumer** menu entry in the **Actions** menu. This functionality is not available to guest users.

To register users to consume assets

1. Ensure that you have created a design-time policy named Consumer-Provider Relationship Policy, as described in "[Creating the Consumer-Provider Relationship Policy](#)" on page 124.
2. In CentraSite Control, go to **Asset Catalog > Browse**.
3. Select the check box next to each of the required assets and click **Actions > Register as Consumer**.
4. In the **User/Group** field, use the **Browse** button to display a list of all users and groups from all organizations, and then select the one you want.
5. If you want to specify additional users or groups, use the plus button beside the **User/Group** field to create a new **User/Group** input field, then use the **Browse** button to select the required user or group as in the previous step.
6. In the **Application** field, choose an application asset from the selection box. The selection box shows Applications assets from all organizations.
7. If you want to specify additional application assets, use the plus button beside the **Application** field to create a new **Application** input field, and choose another application asset.
8. When you have specified all required users, groups and applications, click **OK**.

Requests to register the users, groups and/or applications are sent to the owner(s) of the assets.

9. The owner of each asset can either accept or decline a register as consumer request as follows:
 - a. Go to **Home > My CentraSite > Consumer Registrations** and click **Pending Registrations**.
 - b. To start the approval process for the request, select the check box next to the request and click **Apply Registration Policies**. This triggers the OnConsumerRegistration event, which in turn activates the Consumer-Provider Relationship Policy.
 - c. To decline the request, select the check box next to the request and click **Decline**. The Consumer-Provider Relationship Policy is not activated.
10. After the users, groups and/or applications are approved to consume an asset, you must specify those consumers in the asset's Consumers profile. The Consumers profile appears in the asset's detail page.

Viewing Consumer Registration Requests

To view a summary of all register as consumer requests, go to **Home > My CentraSite > Consumer Registrations** and use the following links:

- **Pending Registrations:** If you are the owner of an asset, and another user has made a request to register as a consumer of the asset, you can view the request here. As the asset owner, you can accept or decline the request.
- **Registration Requests:** If you have made a request to register as a consumer of an asset owned by another user, you can view the status of the request here.

Deploying Virtualized Services and Consumer Applications

This section describes how to deploy virtualized services and consumer applications to webMethods Mediator gateway.

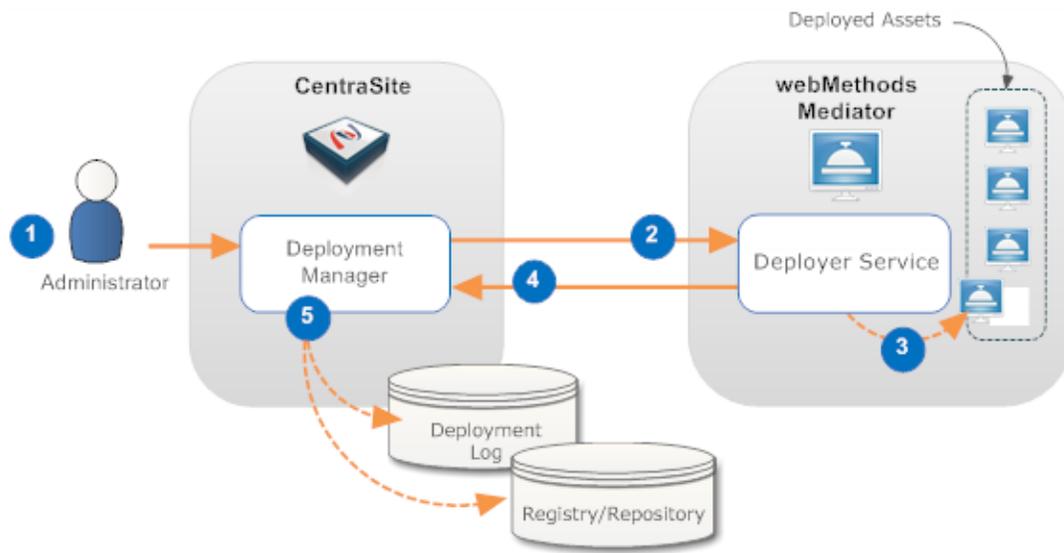

The Synchronous Deployment Model

Deployment refers to the process you use to send virtual services, virtual XML services, virtual REST services and consumer applications to the policy-enforcement points (PEPs) on which they are to be used for run-time governance. Instructions throughout the remainder of this guide use the term “virtualized service” when referring to all three virtual types in general.

Note: This section provides information about deploying virtualized services and consumer applications to webMethods Mediator. If you are using a different kind of PEP, refer to its documentation for deployment procedures and information.

As shown in the following diagram, the deployment process is initiated from CentraSite and is carried out by the “deployer” service on Mediator.

The Deployment Process

Step	Description
1	An administrator initiates the deployment by selecting the assets that are to be deployed and specifies to which Mediator they are to be deployed.
2	The Deployment Manager on CentraSite prepares the asset for deployment (the specific preparation steps depend on the type of asset being deployed) and invokes the deployer service on the Mediator. The prepared asset is submitted as input to this service.
3	The deployer service deploys the asset in the Mediator.
4	If the deployment is successful, the deployer service returns a success message and data that is pertinent to the deployed asset. If the deployment is unsuccessful, the deployer service returns a failure message.
5	The Deployment Manager on CentraSite logs information about the deployment in the Deployment log. If the deployer service returned specific data about the asset, the asset's metadata is updated as needed in the registry/repository.

For more information, see ["What Happens When You Deploy a Virtualized Service?" on page 129](#).

Who Can Deploy Virtualized Services and Consumer Applications?

To deploy virtualized services and consumer applications, you must belong to a role with the following permissions:

- Create Assets —OR— Manage Assets
- Manage Runtime Policies (required to configure virtualized services)
- Manage Lifecycle Models (required to change state of virtualized services)
- Mediator Publisher (required to deploy virtualized services)

For more information about roles and permissions, see *Getting Started with CentraSite*.

Note: Mediator exposes several Web service operations to allow CentraSite to manage deployed assets. This Web service is invoked by CentraSite any time a user deploys or undeploys a virtual service or consumer application to Mediator. A Mediator's configuration details page includes the `User Name` and `Password` fields which identify an Integration Server user who is permitted to execute the Integration Server services associated with Mediator's deployer service. After installation, only members of the Integration Server "Administrators" group are allowed to invoke these services. However, administrators have the flexibility to allow their own users or groups to invoke them. Access to these services is controlled by an ACL, called `MediatorDeployer`. Initially, only the predefined "Administrators" group is assigned to this ACL. An Integration Server administrator can remove this group and add other groups or individual users. For example, you can create your own deployer group, (for example, "MyDeployers") and add Integration Server user IDs to this group. Then, the user must update the `MediatorDeployer` ACL by removing the "Administrators" group and adding the "MyDeployers" group. Now, on the target's configuration detail page, you can specify any user ID that belongs to "MyDeployers" group.

Conditions that Must be Satisfied for Effective Deployment of Virtualized Services

To deploy a virtualized service to a Mediator, the following conditions must be met:

- Ensure that you have the Mediator Publisher role. Only users with this permission can deploy a virtual service. CentraSite will not enable the deployment controls for any other users. For more information, see ["Who Can Deploy Virtualized Services and Consumer Applications?" on page 128](#).
- Ensure that the run-time policies for the virtualized service are active. This is indicated in the **Policies** profile on the virtualized service's detail page. If a policy is inactive, you must activate it as described in ["Activating a Run-Time Policy" on page 98](#).

- Ensure that the gateway to which the virtual service will be deployed has already been created, as described in <placeholder>.
- Ensure that the gateway's specified deployment URL is active and the user credentials of Integration Server are valid. To check this, go to the gateway's detail page and click the **Publish** button. If the connection is not active and valid, activate the deployment endpoint and modify the user credentials as required.
- If the virtualized service is under the control of an active lifecycle model (LCM), ensure that:
 - The virtualized service is in a "deployable" lifecycle state. If you are not certain of what the "deployable" lifecycle state is, consult your CentraSite administrator.
 - The virtualized service has a design-time policy that includes the Change Deployment Status action and it is set to Yes. This action specifies whether the service is eligible for deployment. For more information, see the description of the action in the *CentraSite Developer's Guide*.

If these conditions are not satisfied, all or part of the deployment user interface controls will be disabled when you view the virtual service.

What Happens When You Deploy a Virtualized Service?

When you deploy a virtualized service to one or more Mediator gateways, keep the following in mind.

- **CentraSite automatically validates the service's run-time policy (or policies)** to ensure that:
 - Any action that appears in a single policy multiple times is allowed to appear multiple times.
 - All action dependencies are properly met.

CentraSite will inform you of any violation, and you will need to correct the violations before deploying the service. For more information about dependencies and which actions can be included multiple times in a single policy, see ["Built-In Run-Time Actions Reference for Virtual Services" on page 333](#).

- **You must make modifications to deployed assets in CentraSite.**

If you need to modify a virtualized service or consumer application that is already deployed, you must modify it in CentraSite and then redeploy it to Mediator. Mediator does not monitor CentraSite for updates to deployed assets. If you make changes to a virtual service's processing steps, for example, you must manually redeploy the virtual service to put those changes into effect.

- **You cannot make changes to a run-time policy while it is active.**

To make changes to a policy after it has been switched to the active state you must do one of the following:

- Switch the policy to the Suspended state (to deactivate it), update the policy and then switch it back to the Productive state (to reactivate it).

OR

- Create a new version of the policy, make your changes to the new version of the policy and then switch the new version to the Productive state. Switching the new version of the policy to the Productive state will automatically Retire (and deactivate) the old version.

If you need to update a run-time policy that is already deployed with virtual services that are in production, always use the second method described above (i.e., create a new version of the policy). If you use the first method, which requires you to suspend the existing policy, your production services will be running without the policy while you are making your revisions to it.

- **When you deploy a virtualized service, CentraSite generates a VSD.**

When you deploy a virtualized service to a Mediator, CentraSite generates an XML document called a virtual service definition (VSD). The VSD defines the virtualized service for Mediator, and contains all the run-time policies and resources required to deploy the virtualized service to Mediator.

- **You should not manually edit the endpoint information for virtualized services.**

CentraSite automatically updates the service's CentraSite endpoint to its Mediator endpoint. You can view the Mediator endpoint on the virtualized service's detail page in CentraSite. Because the endpoint information for virtualized services is generated and updated by CentraSite, unlike when managing native services, you should not manually add endpoints to a virtualized service. Instead, allow CentraSite to generate and manage the endpoints for the virtualized services that you deploy.

However, you can deploy multiple virtualized services for a single native service to make the service available over multiple transports and/or security mechanisms. For details about managing endpoints, see *Getting Started with CentraSite*.

- **If deployment fails, the status is set to "Failed" and the failure is logged.**

If Mediator encounters a problem deploying or redeploying a virtualized service, it sets the service's Deployment Status to "Failed" and sends a message to CentraSite describing the problem. This failure is also logged to Mediator. In this case, it is up to the CentraSite or Mediator administrator to take corrective action and redeploy the service manually from CentraSite.

If the reason for the failure is that the Mediator instance is unavailable, and then you restart the Mediator instance, it loads all information about any previously deployed assets.

Deploying, Undeploying and Redeploying Virtualized Services

You can deploy, undeploy and redeploy virtualized services (of any type) to a Mediator in any of the following ways:

- **From the virtualized service's detail page**

You can deploy, undeploy and redeploy a virtualized service to one or more Mediator (see ["Deploying Virtualized Services from a Service's Detail Page"](#) on page 131).

■ **From the Operations > Deployment page**

You can deploy, undeploy and redeploy *multiple* virtualized services to a Mediator in a single step (see ["Deploying Virtualized Services from the Operations > Deployment Page"](#) on page 133).

■ **Using run-time commands**

You can use the CentraSite Command facility to deploy, undeploy and redeploy virtualized services to a Mediator individually or in bulk, and to synchronize consumers (see ["Deploying Virtualized Services Using Command Line Tool"](#) on page 139).

■ **Running a batch process**

You can run a batch process to deploy, undeploy and redeploy multiple virtualized services to a Mediator in a single step (see ["Deploying Virtualized Services Using a Batch Process"](#) on page 143).

If You Migrate Virtualized Services from a Pre-8.2 Release

If you have virtualized services that were created prior to version 8.2, those virtualized services will continue to hold the deployment metadata generated by CentraSite 8.0. Although this metadata is not applicable in CentraSite 8.2, and will not affect deployment in 8.2, we strongly recommend that you perform the following steps:

1. Undeploy all virtualized services from CentraSite 8.0.
2. Upgrade to CentraSite 8.2.
3. Ensure that all gateway endpoints are configured correctly.
4. Deploy all virtualized services from CentraSite 8.2.

Note: Please be aware that the new synchronous deployment model does not support subscriptions and subscription services.

Deploying Virtualized Services from a Service's Detail Page

The following procedure describes how to deploy, undeploy and redeploy a single virtualized service to one or more Mediator gateways, using the service's **Deployment** profile.

To deploy, undeploy or redeploy a virtualized service

1. In CentraSite Control, display the details page of virtualized service. If you need procedures for this step, see ["Viewing or Editing Virtualized Services"](#) on page 82.

2. Select the virtualized service's **Policies** profile and ensure that all of the service's run-time policies are Active. If not, activate them as described in "[Activating a Run-Time Policy](#)" on page 98.
3. Ensure that the virtualized service has a design-time policy that includes the Change Deployment Status action and it is set to Yes. This action specifies whether the service is eligible for deployment. For more information, see the description of this action in the *CentraSite Developer's Guide* .
4. Make sure you switch the service to an active, ready-to-deploy state, as follows. (If you do not know which state to select, you will need to examine your organization's lifecycle model for Service objects or consult an administrator.)
 - a. In the **Actions** menu, select the **Change Lifecycle State** option.
 - b. Select the lifecycle state to which you want to switch the asset and click **OK**. (The list will contain only the states that you are permitted to assign to the service.)

If the state change requires approval, CentraSite will initiate an approval workflow and your request for a state change will be submitted to the appropriate approvers. While the request is awaiting approval, the service will appear in a pending state.
5. After the lifecycle state has been successfully changed, select the virtualized service's **Deployment** profile.

The **Deployment** profile will display the following information.

Column	Description
Target	The target on which the service is deployed.
Target Type	The type of target on which the service is deployed (e.g., webMethods Integration Server or webMethods Insight).
Description	Description of the target.
Deployment Status	The deployment status of the service (e.g., Deployed or Failed).
Date Deployed	The date/time that the deployment occurred.

6. Click the **Deploy** button, select the Mediator gateway(s) to which you want to deploy the virtualized service, and click **OK**.
7. The deployment process is carried out by a synchronous mechanism between the CentraSite and the Mediator:
 - a. CentraSite pushes the virtualized service that is ready for deployment to the Mediator.

- b. Instantly, the Mediator deploys the virtualized service that was received from CentraSite (along with its effective run-time policy), and notifies CentraSite when the deployment process is complete.

For more information, see ["What Happens When You Deploy a Virtualized Service?" on page 129](#).

Important: If the status shown in the **Deployment Status** column does not automatically switch to **Deployed**, click the **Refresh** button to determine whether CentraSite was able to deploy the virtualized service successfully. If the deployment process failed, identify and correct the error and then try deploying the virtualized service again.

8. To undeploy the virtualized services, select the services' check boxes, and choose **Undeploy** from the Actions menu.

If the undeployment is successful, Mediator's deployer service returns a success message, and data that is pertinent to the undeployed virtual service. In addition, CentraSite's Deployment Manager logs information about the undeployment in the Deployment log. If the undeployment is unsuccessful, the deployer service returns a failure message.

Important: If the status shown in the **Deployment Status** column does not automatically switch to **Undeployed**, click the **Refresh** button to determine whether CentraSite was able to undeploy the virtualized services successfully. If the undeployment process failed, identify and correct the error and then try undeploying the virtualized services again.

9. To redeploy the virtualized service, select the services' check boxes, and choose **Redeploy** from the Actions menu.

Important: If the status shown in the **Deployment Status** column does not automatically switch to **Deployed**, click the **Refresh** button to determine whether CentraSite was able to redeploy the virtualized services successfully. If the redeployment process failed, identify and correct the error and then try redeploying the virtualized services again.

10. Examine the deployment log that is displayed by CentraSite Control and check for any errors that occurred during the deployment process.

Deploying Virtualized Services from the Operations > Deployment Page

The following procedure describes how to deploy, undeploy and redeploy multiple virtualized services to a Mediator in a single step.

To deploy, undeploy or redeploy a virtualized service

1. In CentraSite Control, go to **Operations > Deployment**.
2. On the **Deployed Assets** tab, click **Deploy**.

3. In the **Select a Target and Services to be Deployed on the Selected Target** dialog box, perform a keyword or advanced search to display the virtualized services that are ready for deployment.
 - If you want to perform a keyword search and you need procedures for this step, see ["Using a Keyword Search to Select a Target or Service to Deploy"](#) on page 136.
 - If you want to perform an advanced search and you need procedures for this step, see ["Using a Advanced Search to Select a Target or Service to Deploy"](#) on page 138.
4. Click **OK**.
5. The deployment process is carried out by a synchronous mechanism between the CentraSite and the Mediator:
 - a. CentraSite pushes the virtualized service that is ready for deployment to the Mediator.
 - b. Instantly, the Mediator deploys the virtualized service that was received from CentraSite (along with its effective run-time policy), and notifies CentraSite when the deployment process is complete.

For more information, see ["What Happens When You Deploy a Virtualized Service?"](#) on page 129.

The **Deployed Assets** tab will display the following information.

Column	Description						
Pending Changes	Icons indicating the deployment status of the virtualized services.						
	<table border="1"> <thead> <tr> <th>Icon</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>Service is deployed to the target.</td> </tr> <tr> <td></td> <td>Service is pending deployment to the target.</td> </tr> </tbody> </table>	Icon	Description		Service is deployed to the target.		Service is pending deployment to the target.
Icon	Description						
	Service is deployed to the target.						
	Service is pending deployment to the target.						
Deployment ID	The deployment ID of the virtualized service.						
Name	Name of the virtualized service.						
Status	The deployment status of the virtualized service (e.g., Deployed or Failed).						
Date/Time	The date/time that the deployment occurred.						

Column	Description
User ID	The user-ID of the Integration Server user to be used for the deployment operation.
Type	Modification that is been performed on the deployed service.
Label	Description
Processing Step Changes	Reflects any change that is performed in the virtualized service's Processing Steps profile. For example, modifying the HTTP authentication mode.
Runtime Policy Changes	Reflects any change that is performed in the runtime policy associated to the virtualized service. For example, deactivating an associated runtime policy.
WSDL Changes	Reflects any change that is performed in the virtualized service's asset file. For example, modifying an existing asset file or uploading a new asset file.

Important: If the status shown in the **Status** column does not automatically switch to **Deployed**, click the **Refresh** button to determine whether CentraSite was able to deploy the virtualized services successfully. If the deployment process failed, identify and correct the error and then try deploying the virtualized services again.

- To undeploy the virtualized services, select the services' check boxes, and choose **Undeploy** from the Actions menu.

Important: If the status shown in the **Status** column does not automatically switch to **Undeployed**, click the **Refresh** button to determine whether CentraSite was able to undeploy the virtualized services successfully. If the undeployment process failed, identify and correct the error and then try undeploying the virtualized services again.

- To redeploy the virtualized service, select the services' check boxes, and choose **Redeploy** from the Actions menu.

Important: If the status shown in the **Status** column does not automatically switch to **Deployed**, click the **Refresh** button to determine whether CentraSite was able to redeploy the virtualized services successfully. If the redeployment

process failed, identify and correct the error and then try redeploying the virtualized services again.

8. Examine the deployment log that is displayed by CentraSite Control and check for any errors that occurred during the deployment process.

Selecting a Target and Services to be Deployed on the Selected Target

You can use CentraSite's Search feature to select target and services to be deployed on the selected target. You can perform a keyword search or an advanced search. For more information, see ["Using a Keyword Search to Select a Target or Service to Deploy"](#) on page 136 and ["Using a Advanced Search to Select a Target or Service to Deploy"](#) on page 138.

Using a Keyword Search to Select a Target or Service to Deploy

The keyword search is an easy to use search facility in which you can specify arbitrary search patterns.

You can search for all virtualized services that contain one or more specified keywords (i.e., text strings) in the virtualized service's string attributes (virtualized service name, description, etc.).

Conventions for Keyword Searches

The conventions for keyword searches are as follows:

- A keyword search consists of 1-n search keywords. Multiple keywords are space separated. If multiple keywords are given, a logical disjunction (OR) is implied.
- A keyword is treated as partial text which can occur at the beginning of the searched strings. The `starts with` semantics are implied.

Example: If the keyword is `AustralianPostCode`, then the following matches are returned: A sample VS for `AustralianPostCode` as well as `AustralianPostCodeVService`.

- If quotes (" ") exist around a phrase, then a search is performed on the exact phrase within the quotes. A space within a quoted phrase is considered as a space character and not as a logical operation. To force the keyword search to treat the quote characters as a normal character, precede the quote character with a backslash (\). If you want to include the backslash character itself in the search, type two backslashes.
- You can mix and match any number of words and quoted phrases within the keyword field.
- The search is neither case nor accent sensitive, even within a quoted phrase.
Example: A search for `AustralianPostCode` will return the same results as a search for `AUSTRALIANPOSTCODE` or `Australianpostcode`.
- If you enter a string that contains an odd number of double-quote characters, then the last double-quote character is ignored when the search is performed.

- If the keyword search input field is empty when the search is executed, the search returns all available virtualized services.
- The keyword search can include wildcard characters.

Wildcard Characters

The available wildcard characters are:

Character	Usage
* or %	If you use the percent symbol (%) or the asterisk (*), CentraSite replaces the wildcard symbol with as many characters as necessary to find a match. For example, an entry of A%n returns both Amazon and American. If you enter *al, then CalcService, Calendar and AustralianPostCode all fit the search criteria.
? or _	If you use the question mark (?) or the underscore (_), CentraSite replaces the wildcard symbol with a single character in order to find a match. Example: AustralianPostCode?VService matches any character for ?.

You can use a wildcard character at any point in the keyword text, and multiple times throughout the keyword text. If you enter a wildcard character in the middle of a string, for example `cat*dog`, then at least one of the searched attributes must contain the string in order for the asset or supporting document to be included in the result set.

If a wildcard character between two words is surrounded by spaces, such as `word1 * word2`, the wildcard will match one word.

Note: Keep the following in mind:

- Certain non-alphanumeric characters that can appear in the name of a virtualized service are currently ignored by CentraSite's wildcard mechanism when you include them in a keyword search. In particular, the hyphen (-) is ignored. Thus, if you have created the virtualized services `AustralianPostCodeVService-1` and `AustralianPostCodeVService_1`, the wildcard search for `AustralianPostCodeVService?` will find `AustralianPostCodeVService_1` but not `AustralianPostCodeVService-1`.
- The percent (%) character acts as a word delimiter when it appears in the text to be searched. Thus, for example, if the description field of a virtualized service contains the text `abc%def` (the characters a, b, c, %, d, e, f), this is treated by the search mechanism as two adjacent words `abc` and `def`. A wildcard search such as `abc*def` looks for a single word beginning with `abc` and ending with `def`, so the search will not find this asset.

Performing a Keyword Search

To search by keyword

1. In CentraSite Control, go to **Operations > Deployment**.
2. On the **Deployed Assets** tab, click **Deploy**. This opens up the **Select a Target and Services to be Deployed on the Selected Target** dialog.
3. In the text box, type the keyword(s) to search for. You can use one or more wildcards to specify the keywords.

If you leave the text box blank, or enter just a wildcard, the entire set of virtualized services is returned.

CentraSite returns the virtualized services that match the search criteria. The search looks for the keyword(s) in the virtualized service's name, type and description attributes.

Using a Advanced Search to Select a Target or Service to Deploy

CentraSite's advanced search capabilities allow you to search for virtualized services on the basis of service types and targets.

To search using service type and target

1. In CentraSite Control, go to **Operations > Deployment**.
2. On the **Deployed Assets** tab, click **Deploy**.
3. In the **Select a Target and Services to be Deployed on the Selected Target** dialog box, do the following:
 - a. In the field **Browse By**, select a virtualized service type. As a result, only virtualized services that are classified with this service type will be displayed.
 - If you do not specify a virtualized service type in the field **Browse by**, CentraSite Control displays a list of all virtualized services belonging to the CentraSite.
 - If you specify a virtualized service type in the field **Browse by**, CentraSite Control displays a list of all virtualized services that belong to the specified service type.

There are several generic entries in the drop-down list for the **Browse by** field. These are:

- **[All]**

This lists all virtualized services that are available in a deployable state.
- **[Virtual Service]**

This lists all virtual Web services that are available in a deployable state.
- **[Virtual REST Service]**

This lists all virtual REST services that are available in a deployable state.

- **[Virtual XML Service]**

This lists all virtual XML services that are available in a deployable state.

- b. In the field **Target**, select a target for deploying the selected services.
- c. Select the virtualized services that you want to deploy on the selected target.

4. Click **OK**.

Deploying Virtualized Services Using Command Line Tool

You can perform the following deployment tasks by executing commands in the command line interface `CentraSiteCommand.cmd` (Windows) or `CentraSiteCommand.sh` (UNIX) of CentraSite. The tool is located in `<CentraSiteInstallDir>/utilities`.

- Deploy or undeploy virtual services to Mediator.
- Perform a “bulk deploy”, a “bulk undeploy”, a “bulk redeploy”, and a “bulk clean redeploy”.
- Synchronize consumers.

If you start the command line tool with no parameters, you receive a help text summarizing the required input parameters.

The parameters of the command are case-sensitive, so for example the parameter `-url` must be specified as shown and not as `-URL`.

Deploy a Virtualized Service to Mediator

To deploy a virtualized service to Mediator, use a `deploy` command of the following format:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd deploy [-url
<CENTRASITE-URL>] -user <USER-ID> -password <PASSWORD> -virtualService
<VIRTUAL-SERVICE> -gateway <GATEWAY>
```

Input Parameters

The following table describes the complete set of input parameters that you can use with the `deploy` command:

Input Parameter	Description
<code>-url</code>	The fully qualified URL (<code>http://localhost:53307/CentraSite/CentraSite</code>) for the CentraSite registry/repository.

Input Parameter	Description
-user	The user ID of a user who has the CentraSite Administrator role.
-password	The password of the user identified by the parameter -user.
-virtualService	The name of the virtual service.
-gateway	The gateway to which the virtual service identified by the parameter -virtualService is to be deployed.

For example (all in one line):

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd deploy -url
http://localhost:53307/CentraSite/CentraSite -user Administrator -
password manage -virtualService VS1 -gateway Gateway1
```

Undeploy a Virtualized Service from Mediator

To undeploy a virtualized service from Mediator, use a undeploy command of the following format:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd undeploy [-url
<CENTRASITE-URL>] -user <USER-ID> -password <PASSWORD> -virtualService
<VIRTUAL-SERVICE> -gateway <GATEWAY>
```

Input Parameters

The following table describes the complete set of input parameters that you can use with the undeploy command:

Input Parameter	Description
-url	The fully qualified URL (http://localhost:53307/CentraSite/CentraSitee) for the CentraSite registry/repository.
-user	The user ID of a user who has the CentraSite Administrator role.
-password	The password of the user identified by the parameter -user.
-virtualService	The name of the virtual service.

Input Parameter	Description
-gateway	The gateway from which the virtual service identified by the parameter -virtualService is to be undeployed.

For example (all in one line):

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd undeploy -
url http://localhost:53307/CentraSite/CentraSite -user Administrator -
password manage -virtualService VS1 -gateway Gateway1
```

Deploy, Undeploy or Redeploy Multiple Virtualized Services in Mediator

To deploy, undeploy or redeploy multiple virtualized services in Mediator, use commands of the following formats:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd bulk deploy [<parameters>]
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd bulk undeploy [<parameters>]
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd bulk redeploy [<parameters>]
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd bulk clean redeploy [<parameters>]

<parameters> :
[-url <CENTRASITE-URL>]
-user <USER-ID>
-password <PASSWORD>
-gateway <GATEWAY>]
```

Input Parameters

The following table describes the complete set of input parameters that you can use with the above commands:

Input Parameter	Description
-url	The fully qualified URL (http://localhost:53307/CentraSite/CentraSite) for the CentraSite registry/repository.
-user	The user ID of a user who has the CentraSite Administrator role.
-password	The password of the user identified by the parameter -user.
-gateway	The gateway to/from which the virtual service is to be deployed/undeployed/redeployed.

For example (all in one line):

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd bulk deploy -
url http://localhost:53307/CentraSite/CentraSite -user Administrator -
password manage -gateway Gateway1
```

Synchronize Consumers on Mediator

To synchronize consumers on Mediator, use a `sync consumers` command of the following format:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd sync consumers
[-url <CENTRASITE-URL>] -user <USER-ID> -password <PASSWORD> -gateway
<GATEWAY>
```

Input Parameters

The following table describes the complete set of input parameters that you can use with the `sync consumers` command:

Input Parameter	Description
<code>-url</code>	The fully qualified URL (<code>http://localhost:53307/CentraSite/CentraSite</code>) for the CentraSite registry/repository.
<code>-user</code>	The user ID of a user who has the CentraSite Administrator role.
<code>-password</code>	The password of the user identified by the parameter <code>-user</code> .
<code>-gateway</code>	The gateway on which to synchronize the consumers.

For example (all in one line):

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteCommand.cmd sync consumers
-url http://localhost:53307/CentraSite/CentraSite -user Administrator -
password manage -gateway Gateway1
```

Configuring API Key Header Using Command Line Tool

The command line tool in CentraSite is used to specify the API key header name. This API key header name specified is sent to Mediator as a part of publishing gateways and is used by Mediator for authentication of the API at runtime. Once the Mediator gateway is published, the new header name is set in Mediator .

To set the API key header name, use the following command:

```
set APIKey header name -url <CENTRASITE-URL> -user <USER-ID> -password <PASSWORD>
-apiKeyHeaderName <API-KEY-HEADER-NAME>
```

Input Parameters

The following table describes the complete set of input parameters that you can use with the above command:

Input Parameter	Description
<code>-url</code>	The fully qualified URL (<code>http://localhost:53307/CentraSite/CentraSite</code>) for the CentraSite registry/repository.
<code>-user</code>	The user ID of the registered CentraSite user. For example, a user who has the CentraSite Administrator role.
<code>-password</code>	The password for the registered CentraSite user identified by the parameter <code>-user</code> .
<code>-apiKeyHeaderName</code>	The custom API key header used to send API key to Mediator The default API key header is <code>x-CentraSite-APIKey</code> .

Note: If a custom header for the **API key header** property is not defined, the `x-CentraSite-APIKey` is used as the default value. To retrieve the current API key header, the `get APIKey` header name command is used.

Deploying Virtualized Services Using a Batch Process

Use `Runtime.deployment.Deployer` when you do not have access to a browser or graphical user interface environment, and you want to perform deployment tasks. You can also use `Runtime.deployment.Deployer` when you want to automate deployment tasks through batch processes.

An automated deployment through a batch mode can be initiated by configuring the `DeploymentConfiguration.properties` file located in the URL `http://<host>:53307/CentraSite/CentraSite/ino:dav/ino:dav/projects/CentraSite/configuration`.

Specifying a Deploy Batch Size

`BatchSize` is the maximum number of virtualized services to be pushed to the Mediator before a syncpoint is taken. The default `BatchSize` is 50. To improve performance, you can set a `BatchSize` to define the maximum number of virtualized services to be pushed between two syncpoints using the property line:

```
com.softwareag.centrasite.runtime.deployment.DeployBatchSize=50
```

The `BatchSize` property can be set at any time. If a bulk deployment is already in progress, the current batch is sized according to the previous batch size. Subsequent batches use the new size. Suppose if the `BatchSize` is set to zero and changed while a deploy operation is already in progress, that operation loads the data as a single

batch. Any subsequent deploy operations on the same CentraSite Control use the new BatchSize.

Specifying a Transaction Timeout

TransactionTimeout specifies the maximum time, in milliseconds, allowed for deployment operations (deployment, undeployment and consumer sync) that were pushed to Mediator to respond. Any such operations that do not respond before this timeout occurs are rolled back. The default TransactionTimeout is 6000 (ms). To improve performance, you can set a TransactionTimeout to define the maximum time for the deployment operations to respond using the property line:

```
com.softwareag.centrasite.runtime.deployment.TransactionTimeout=60000
```

For example, if a deployment operation attempts to set a transaction timeout of 360 seconds, and the TransactionTimeout setting is 300 seconds, the TransactionTimeout setting of 300 seconds is used. After the TransactionTimeout of 300 seconds the deployment operations roll back.

Note: If set to 0, the transaction will not time out.

Deploying, Undeploying and Redeploying Consumer Applications

You can deploy consumer application asset(s) to a policy enforcement point (PEP) such as webMethods Mediator in any of the following ways:

■ From the Operations > Deployment page

You can deploy multiple consumer applications to a Mediator in a single step (see ["Deploying Consumer Applications from the Operations > Deployment Page" on page 144](#)).

■ Running a script file from a command line

You can run a script file to deploy multiple consumer applications to a Mediator in a single step (see ["Deploying Consumer Applications Using a Script File" on page 146](#)).

Deploying Consumer Applications from the Operations > Deployment Page

The following procedure describes how to deploy multiple consumer application assets to a Mediator in a single step.

To deploy consumer applications

1. In CentraSite Control, go to **Operations > Deployment**.
2. On the **Deploy Consumers** tab, click the **Synchronize** button.
3. In the **Select a Target and Consumer Applications to be Deployed** dialog box, perform a keyword or advanced search to display the consumer applications and the targets that are ready for deployment.

- If you want to perform a keyword search and you need procedures for this step, see [Using a Keyword Search to Select a Target or Service to Deploy](#).
 - If you want to perform an advanced search and you need procedures for this step, see [Using a Advanced Search to Select a Target or Service to Deploy](#).
4. Click **OK**.
 5. The deployment process is carried out by a synchronous mechanism between the CentraSite and the Mediator:
 - a. CentraSite invokes the Mediator's deployer service and pushes the consumer applications that are ready for deployment to the Mediator.
 - b. Instantly, Mediator deploys the consumer applications that were received from CentraSite and notifies CentraSite when the deployment process is complete.

The **Deploy Consumers** tab will display the following information.

Column	Description						
Pending Changes	Icons indicating the deployment status of the consumer applications.						
	<table border="1"> <thead> <tr> <th>Icon</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td></td> <td>The consumer application is deployed to the target.</td> </tr> <tr> <td></td> <td>The consumer application is pending deployment to the target.</td> </tr> </tbody> </table>	Icon	Description		The consumer application is deployed to the target.		The consumer application is pending deployment to the target.
Icon	Description						
	The consumer application is deployed to the target.						
	The consumer application is pending deployment to the target.						
Rule ID	The synchronization rule ID of the target (that is, webMethods Mediator or Insight).						
Target	The name of the target on which the consumer application is deployed.						
Last Sync Date	The date/time that the deployment occurred.						
Status	The deployment status of the consumer application (e.g., Deployed or Failed).						

Important: If the status shown in the **Status** column does not automatically switch to **Deployed** or **Failed**, click the **Refresh** button to determine whether CentraSite was able to deploy the virtualized services successfully. If the deployment process failed, identify and correct the error and then try deploying the virtualized services again.

Deploying Consumer Applications Using a Script File

The deployment operation of a consumer application invoked between CentraSite and the Mediator using command line utility, includes a `main()` method, which allows it to be called from a Windows batch file or from a UNIX shell script.

Creating a Script File to Invoke the Deployment Operation (for Windows)

Create a script file that looks as follows if CentraSite is running under Windows.

```
@echo off
set JAVAEXE=fullPathToJava.exe set REDIST=CentraSiteHomeDirectory\redist
set BASEDIR=%~dp0
cd /d %REDIST%

REM build CLASSPATH with all files from jar directory
set LOCAL_CLASSPATH=
for %%I in (*.jar) do call "CentraSiteHomeDirectory\bin\cfg\lcp.cmd" %%I

%JAVAEXE% -cp %LOCAL_CLASSPATH% deployerClassName %*
cd /d %BASEDIR%
```

Where *deployerClassName* is the name of the deployer that you want to run.

Example

The following is an example of a script file that calls the Consumer Applications deployer:

```
@echo off
REM
REM Run Consumer Applications deployer
REM
set JAVAEXE=D:\software\java\jdk1.5.0_12\bin\java
set REDIST=C:\SoftwareAG\CentraSite\redist
set BASEDIR=%~dp0
cd /d %REDIST%

REM build CLASSPATH with all files from jar directory
set LOCAL_CLASSPATH=
for %%I in (*.jar) do call "C:\SoftwareAG\CentraSite\bin\cfg\lcp.cmd" %%I

%JAVAEXE% -cp %LOCAL_CLASSPATH%
com.softwareag.centrasite.runtime.pep.util.VirtualServiceDeployer %*
cd /d %BASEDIR%
```

Creating a Script File to Invoke the Deployment Operation (for UNIX)

Create a script file that looks as follows if CentraSite is running under Unix.

```
set javaexe="fullPathToJava.exe"
set redist="CentraSiteHomeDirectory/redist"
set mainjar="CentraSiteRuntimePEP.jar"
set delim='\:'
cd "$redist"
set cl=""
foreach j ( 'ls *.jar' )
  if ($cl != "") set cl=${cl}${delim}
  set cl=${cl}${j}
end
```

```
setenv CLASSPATH ${mainjar}${delim}${cl}
$javaexe deployerClassName $*
```

Where *deployerClassName* is the name of the deployer that you want to run.

Example

The following is an example of a script file that calls the Consumer Applications deployer:

```
#!/bin/csh
#
# Run Consumer Applications deployer
#
set javaexe="/mydir/softwareag/cjp/v16/bin/java"
set redist="/mydir/softwareag/CentraSite/redist"
set mainjar="CentraSiteRuntimePEP.jar"
set delim='\:'
# build CLASSPATH with all files from jar directory
cd "$redist"
set cl=""
foreach j ( `ls *.jar` )
  if ($cl != "") set cl=${cl}${delim}
  set cl=${cl}${j}
end
setenv CLASSPATH ${mainjar}${delim}${cl}
$javaexe com.softwareag.centrasite.runtime.pep.util.VirtualServiceDeployer $*
```

Viewing the Deployment History Log

The Deployment History Log contains information about the virtualized services that CentraSite has pushed to the Mediator for deployment.

To view the Deployment History Log, you must belong to the Mediator Publisher role. To see the list of predefined roles that include this permission, see the *CentraSite Administrator's Guide*.

The following procedure describes how to view the deployment history log. To view this log, you must belong to a Mediator Publisher role.

- If you belong to one of the following roles, you can view all entries in the deployment history log.
 - CentraSite Administrator
 - Organization Administrator
 - Operations Administrator
- If you belong to the Organization Administrator role for an organization, you can view the deployment history log entries for virtualized services that were created by users in your organization.
- If you do not belong to either of these roles, but you have the Mediator Publisher role, you can view the deployment history log entries for virtualized services that you created.

To view the Deployment History Log

1. In CentraSite Control, go to **Operations > Deployment**.
2. Click the **Deployment History** tab to view the list of all virtualized services that are sent to the Mediator.
3. If you want to filter the list, type a partial string in the **Search** field. CentraSite applies the filter to the **Name** column. The **Search** field is a type-ahead field, so as soon as you enter any characters, the display will be updated to show only those virtualized services whose name contains the specified characters. The wildcard character “%” is supported.

The **Deployment History** tab provides the following information about each virtualized service.

Column	Description
Rule ID	The synchronization rule-ID that CentraSite automatically generates up on creation of the Mediator in CentraSite Control.
Name	The name assigned to the virtualized service.
Type	The type of the virtualized service (say, Web Service, XML Service or REST Service).
Version	The user-assigned version identifier for the virtualized service.
Target Name	The name of the target on which the virtualized service is deployed.
Action	The deployment action of the virtualized service on the Mediator (e.g., Deployed, Undeployed).
Status	The deployment status of the virtualized service on the Mediator (e.g., Success, Failed).
Date	The date/time that the virtualized service has deployed, redeployed or undeployed.

4. To view details of a particular deployment workflow, click the hyperlinked value in the **Name** column.

Deleting a Deployment Activity Log

When you delete an activity log, keep the following points in mind:

- To delete an activity log, you must belong to one of the following roles:
 - CentraSite Administrator
 - Organization Administrator
 - Operations Administrator
- Remember deleting an activity log via the **Deployment History** tab does not affect the deployment status of a virtualized service. However, deleting an activity log via the **Deployed Assets** tab will undeploy a virtualized service from the Mediator and the status automatically switches to **Undeployed**.
- The **Deployment History** tab contains log entries for every deployment operation (such as Deployed, Undeployed etc.,) of a virtualized service. However, the **Deployed Assets** tab contains log entry only for a Deployed operation of the virtualized service. Once you undeploy a virtualized service, the log entry will automatically get removed from the **Deployed Assets** tab.
- Be aware that you can never delete the last Deployed activity log of a virtualized service or consumer application via the **Deployment History** tab.

You can delete a deployment activity log in any of the following ways:

- Using the **Deployed Assets** tab on the Deployment page as described in "[Performing a Delete Operation Using the Deployed Assets Tab](#)" on page 149. This procedure enables you to delete the activity logs of virtualized services in the CentraSite Control.
- Using the **Deployment History** tab on the Deployment page as described in "[Performing a Delete Operation Using the Deployment History Tab](#)" on page 150. This procedure enables you to delete the activity logs of virtualized services and consumer applications in the CentraSite Control.

Performing a Delete Operation Using the Deployed Assets Tab

You delete the “deployed” and “redeployed” activity logs of virtualized services via the **Deployed Assets** tab.

You can delete multiple activity logs in a single step.

To delete one or more activity logs

1. In CentraSite Control, go to **Operations -> Deployment**.
2. On the **Deployed Assets** tab, mark the checkbox next to the name of each activity log that you want to delete. (You can select multiple logs.)
3. In the **Actions** menu, click **Delete**.

When you are prompted to confirm the delete operation, click **OK**.

Each selected log is permanently removed from the CentraSite registry/repository. The activity logs in the virtualized service's **Deployment** profile and target's **Service** profile are not affected.

Performing a Delete Operation Using the Deployment History Tab

You delete the “deployed”, “undeployed”, “redeployed” and “failed” activity logs of virtualized services and consumer applications via the **Deployment History** tab.

You can delete multiple activity logs in a single step.

To delete one or more activity logs

1. In CentraSite Control, go to **Operations -> Deployment**.
2. On the **Deployment History** tab, mark the checkbox next to the name of each activity log that you want to delete. (You can select multiple logs.)
3. Choose **Delete**.

When you are prompted to confirm the delete operation, click **OK**.

Each selected log is permanently removed from the CentraSite registry/repository. The activity logs in the asset's **Deployment** profile and target's **Service** profile are not affected.

Securing Communications for Synchronous Deployment

An administrator can configure CentraSite to use either of the following kinds of authentication:

- HTTP Basic authentication
- HTTPS (Secure Sockets Layer (SSL)) authentication

Configuring CentraSite to use SSL authentication provides secure communications for the deployment.

This section explains how SSL works with CentraSite (which acts as the client) and Mediator (which acts as the server). This section also provides the information you need to configure both the client and server sides for SSL authentication.

Anatomy of a SSL Connection

It is useful to conceptualize a CentraSite SSL connection in terms of a SSL client and a SSL server. The request for an SSL connection originates from a client.

During the SSL handshake process, the Mediator acting as the SSL server responds to the request for a connection by presenting its SSL credentials (an X.509 certificate) to the requesting CentraSite client. If those credentials are authenticated by the CentraSite client, either:

- An SSL connection is established and information can be exchanged between the CentraSite and Mediator.

—OR—

- The next phase of the authentication process occurs, and the Mediator requests the SSL credentials of the CentraSite. If the Mediator verifies those credentials (that is, the client's identity), an SSL connection is established and information exchange can take place.

SSL Connection Type

The types of SSL connection referred to above are termed *one-way* and *two-way* SSL authentication:

- In a *one-way* SSL connection, client authenticates the credentials of server in preparation for setting up a secure transaction. In most cases, the server knows nothing about the client's identity because verification of its credentials is not required. When desired, however the client can be authenticated by means such as basic username/password.

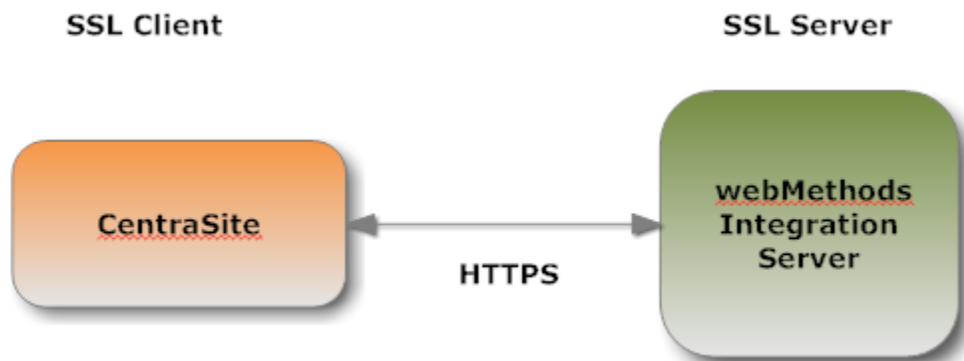

This type of connection is typically one where CentraSite needs to verify the authenticity of the Mediator without itself needing to be authenticated. As a result, configurations on the CentraSite side are not actually required for this one-way connection.

- In a *two-way* SSL connection, both client and server must authenticate each other's credentials before an SSL connection is established and information can be exchanged.

Unlike a one-way SSL connection, both CentraSite and the Mediator require access to each other's SSL certificates in order to authenticate each other, establish an SSL connection, and transmit information. Compared to a one-way connection, a two-way SSL connection provides a much higher level of security.

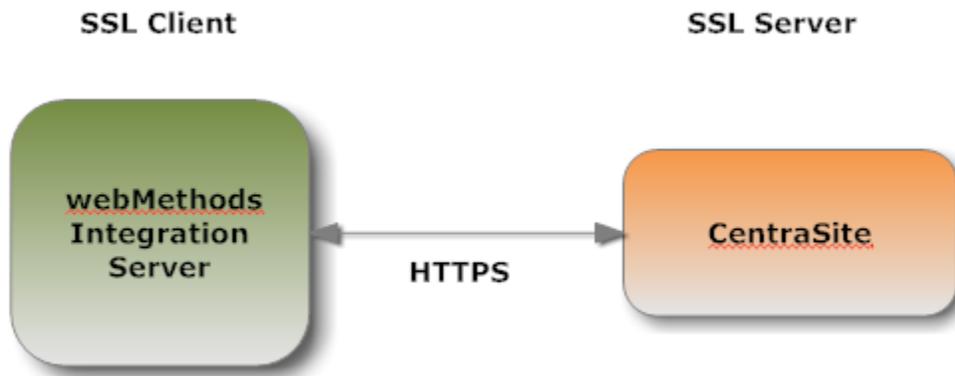

As an SSL Client

When the CentraSite submits a HTTPS request to the Mediator, CentraSite is the SSL client and the Mediator with which it is communicating acts as the SSL server.

As an SSL Server

When the Mediator submits a request to CentraSite via HTTPS, and a two-way SSL connection is established, the Mediator acts as the SSL client and the CentraSite acts as the SSL server.

Roadmap for Configuring SSL

The following table provides a high-level roadmap for configuring SSL on CentraSite.

Task	Activities	Notes
Create CentraSite keys and certificates	<ul style="list-style-type: none"> ■ Generate a public key/private key pair. ■ Generate a certificate signing request (CSR) and send to the certificate authority (CA) for signing. ■ Receive validated certificate from the CA. ■ Import signed certificate into a keystore. 	<p>Required for one-way and two-way SSL connections.</p> <p>Refer to the documentation for Java <i>keytool</i> or your certificate management tool.</p>
Create keystore and truststore for CentraSite	<ul style="list-style-type: none"> ■ Create a keystore and import the signed certificate and private key. ■ Create a truststore and import the certificate of the signing CA. ■ Store the keystore and truststore in a secure CentraSite certificates directory. 	<p>Required for one-way and two-way SSL connections.</p> <p>Refer to the documentation for your certificate management tool.</p>

Task	Activities	Notes
	<p>Important: You use a Java <i>keytool</i> to create the keystore, you cannot import an existing private key. You can use other tools such as OpenSSL or Portecle.</p>	
Obtain certificates of webMethods Mediator	<p>Use the CentraSite truststore to save:</p> <ul style="list-style-type: none"> ■ Signed certificate of the Mediator. ■ Signed certificate of the CA for the Mediator's SSL certificate. 	Required for one-way and two-way SSL connections.

Creating Keys and Certificates

Use a standard certificate management tool, such as OpenSSL or Portecle, to generate a private/public key pair for CentraSite. Then, place the public key in a certificate signing request (CSR).

After creating the CSR, send to the CA to sign the CSR. Request the certificate in DER format. If you receive a certificate in PEM format (or any format other than DER), you need to convert it to DER format.

The signing CA's certificate attests to the identity of the CA that signed the digital certificate for the CentraSite. The CA should send this certificate to you when it sends you the digital certificate for the CentraSite.

Once you receive your signed certificate from the CA, you need to import the certificate into a keystore. You will then have an SSL certificate and private key to use with CentraSite.

Note: The above process is described in general terms. The procedures may vary somewhat, depending upon the CA that you use.

Creating a Keystore and Truststore

Keystores and truststores are files that function as repositories for storage of keys and certificates necessary for SSL authentication, encryption/decryption, and digital signing/verification services. Keystores and truststores provide added layers of security and ease of administration, compared to maintaining the keys and certificates in separate files.

For information about creating keystores and truststores, importing keys and certificates into keystores and truststores, and other operations with these files, refer to the documentation for your certificate management tool.

For information about using CentraSite with keystores and truststores, see "[Keystores and Truststores](#)" on page 154.

Obtaining the Certificates and Keys of the webMethods Mediator

If your CentraSite will submit HTTPS requests to the Mediator, the CentraSite will be acting as a client and will receive certificates from this Mediator. In order for these transactions to work, your CentraSite must have copies of their public keys and signing CA certificates. For information on importing Mediator certificates to CentraSite and setting up client authentication, see *webMethods Integration Server Administrator's Guide*

Keystores and Truststores

CentraSite stores its private keys and SSL certificates in keystore files and the trusted roots for the certificates in truststore files. Keystores and truststores are secure files with industry-standard file formats.

Keystore File

CentraSite uses a special file called a *keystore* to store SSL certificates and keys.

A keystore file contains one or more pairs of a private key and signed certificate for its corresponding public key. The keystore should be strongly protected with a password, and stored (either on the file system or elsewhere) so that it is accessible only to administrators.

Keystore File Formats

The default, certificate file format for a CentraSite keystore is JKS (Java keystore). Java keystore is a commonly used, standardized, certificate file format that provides a high degree of portability. PKCS#12 is another format you can use for a keystore. Other keystore types can be made available by:

- Loading additional security providers
- Setting the `watt.security.keyStore.supportedTypes` property.

HSM-Based Keystores

Under certain conditions, Mediator supports the use of keystore files stored on a Hardware Security Module (HSM). Integration Server supports HSM-based keystores for ports, but not for other components. You cannot use HSM-based keystores with remote server aliases, outbound certificates, an internal server port, WS-Security, or Integration Server public services.

Creating a Keystore

You can create and manage CentraSite keystores at the command line using `keytool`, a Java certificate editor.

You can also use other standard tools such as OpenSSL and Portecle.

Note: Software AG does not provide its own set of keystore utilities for creating or managing keystore files.

Truststore File

CentraSite uses a *truststore* to store its trusted root certificates, which are the public keys for the signing CAs. Although a truststore can contain the trusted roots for entire certificate chains, there is no requirement for the organization of certificates within a CentraSite truststore. It simply functions as a database containing all the public keys for CAs within a specified trusted directory.

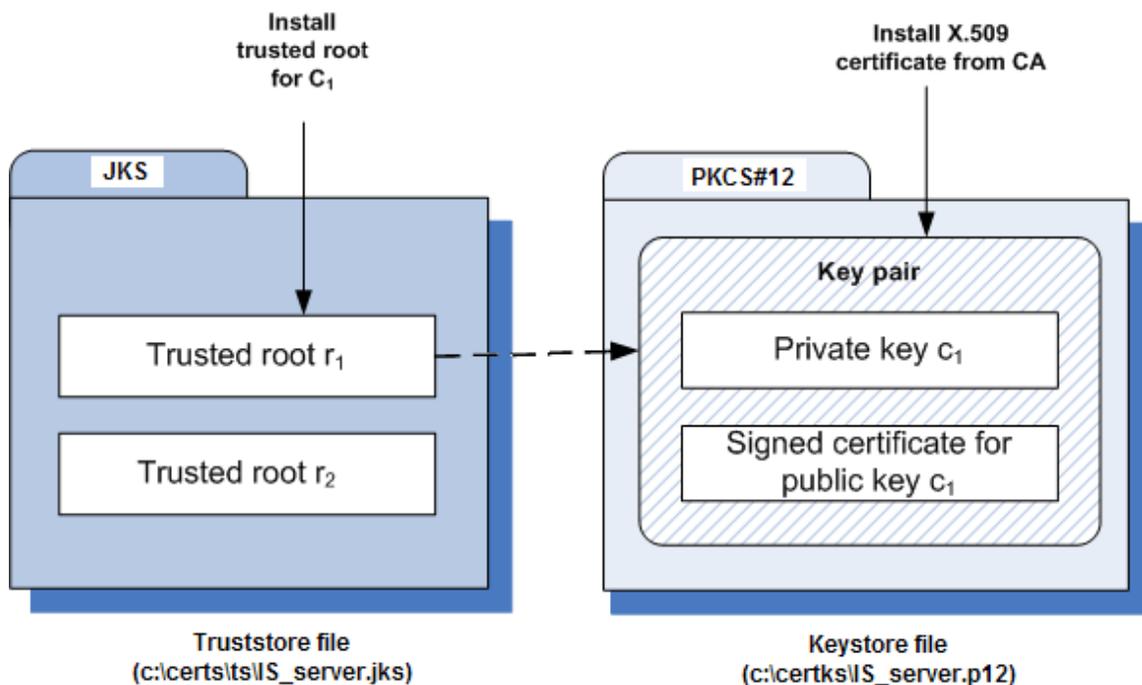

Truststore File Formats

CentraSite uses a *truststore* to store its trusted root certificates, which are the public keys for the signing CAs. Although a truststore can contain the trusted roots for entire certificate chains, there is no requirement for the organization of certificates within a CentraSite truststore. It simply functions as a database containing all the public keys for CAs within a specified trusted directory.

How Uses a Keystore and Truststore

For a CentraSite service to be SSL authenticated, it must have a valid, authorized X.509 certificate installed in a keystore file *and* the private key and signing certificate for the certificate issuer (CA) installed in a truststore file. The following figure illustrates these requirements and the relationship between the two files.

Example Truststore File and Keystore File Showing Relationship

As shown in the above figure, the same truststore file can contain multiple trusted root certificates (public keys for the signing CAs). These trusted roots might be associated with numerous keystore files. A keystore file can contain the key pairs for

multiple CentraSite services, and the entire certificate chain required for a service's authentication.

With a certificate chain, it is necessary to validate each subsequent signature in the list until a trusted CA certificate is reached. For CentraSite, you must include the entire chain of certificates in a keystore and truststore. Also, any root CA certificates in use by clients must be in a CentraSite truststore.

Protecting Keystore and Truststore Files

Keystore and truststore files exist within the file system of your operating system, and since these are critically important files, you want to maintain them in a secure directory path. If either of these files cannot be located, CentraSite authentication will be disabled and no connection with the CentraSite can be made. It is recommended that only users serving as CentraSite administrators have access to these certificate files.

Configuring CentraSite to Use SSL

The configuration settings covered in this section deal with the CentraSite client side.

You can configure CentraSite client to use SSL in any of the following ways.

Configure CentraSite Client to Use One-way SSL

You perform the following procedure to configure CentraSite for one-way SSL authentication:

To configure one-way SSL

1. Create at least one truststore `centrasitetruststore.jks`, in JKS format, in a desired location on the machine where CentraSite is running.
2. Import the Mediator's self-signed certificate `mediator.cer` into the above created truststore or JAVA cacerts.

When prompted for password, the default for truststores is `password`.

```
C:\deploykeystores\new>keytool -export -alias mediator
-keystore mediatorkeystore.jks -rfc -file mediator.cer
Enter keystore password:
Certificate stored in file <mediator.cer>

C:\deploykeystores\new>keytool -import -alias mediator
-keystore centrasitetruststore.jks -file mediator.cer
Enter keystore password:
Re-enter new password:
Owner:
Issuer:
Serial number:
Valid from:
Certificate fingerprints:
    Trust this certificate? [no]: yes
Certificate was added to keystore

C:\deploykeystores\new>
```

If opting to import certificate in to Java cacerts, the Java runtime needs to trust the certificates of the Mediator in order to establish the SSL connections. To do that, add the certificate to the trusted certificates of Java via the *keytool* utility that comes with Java. The following command will add the certificate located at a location (for example, c:\temp\server.crt) to the trusted certificates in the Java used by CentraSite:

```
keytool.exe -import -v -trustcacerts -alias test -file "C:\temp\server.crt"
-keystore "<JDKInstallDir>\jre\lib\security\cacerts"
```

When prompted for password, the default for Java is `changeit`.

3. Add the following Java system properties to the `custom_wrapper.conf` file in `<SuiteInstallDir>/profiles/CTP/configuration` folder. For information about setting Java system properties, see the webMethods cross-product document, *Working with the webMethods Product Suite and the Java Service Wrapper*.

```
wrapper.java.additional.<n>=-Djavax.net.ssl.trustStore=
  <location_of_truststore>
wrapper.java.additional.<n>= -Djavax.net.ssl.trustStorePassword=
  <password_for_truststore>
```

In the settings above:

- `<n>` is a unique sequence number that you assign to each `wrapper.java.additional` property. For more information about assigning this sequence number, see the `wrapper.java.additional` property description in the cross-product document, *Working with the webMethods Product Suite and the Java Service Wrapper*.
- `<location_of_truststore>` is the location to the trust store file (for example, `C:/deploykeystores/new/centrasitetruststore.jks`).
- `<password_for_truststore>` is the password for the trust store.

4. Go to the section **#Java Additional Parameters**. Add the following property lines:

```
wrapper.java.additional.7=-Djavax.net.ssl.
trustStore="C:/deploykeystores/new/centrasitetruststore.jks"
wrapper.java.additional.8=-Djavax.net.ssl.trustStorePassword=password
```

5. Set the values as needed:

`wrapper.java.additional.7=-Djavax.net.ssl.trustStore=` represents the location of a truststore file (for example, `centrasitetruststore.jks`).

`wrapper.java.additional.8=-Djavax.net.ssl.trustStorePassword=` represents the password for a truststore.

6. Save and close the file.
7. Now restart the CentraSite Tomcat. All communication via the Mediator to the database should now be using SSL.

Configure CentraSite Client to Use Two-way SSL

You perform the following procedure to configure CentraSite for two-way SSL authentication:

To configure two-way SSL

1. Using OpenSSL, create a self-signed certificate (centrasite.cer) with the following command:

```
openssl req -new -x509 -days 2000 -sha1 -newkey rsa:1024 -nodes
-keyout server.key -out server.crt -subj "/O=Company/OU=Unit/CN=localhost"
```

Whatever is specified in the CN section of the subject must match the hostname of the machine running the Mediator and is used to send requests to the Mediator.

2. Create at least one keystore centrasitekeystore.jks, in PKCS#12 or JKS format, containing a CentraSite key pair to use for SSL.

```
C:\deploykeystores\new>keytool -v -genkeypair -alias centrasite
-keyalg RSA -validity 1000 -keystore centrasitekeystore.jks
Enter keystore password:
Re-enter new password:
What is your first and last name?
What is the name of your organizational unit?
What is the name of your organization?
What is the name of your City or Locality?
What is the name of your State or Province?
What is the two-letter country code for this unit?

Enter key password for <centrasite>
<RETURN if same as keystore password>:
[Storing centrasitekeystore.jks]

C:\deploykeystores\new>
```

3. Create at least one truststore centrasitetruststore.jks, in JKS format, in a desired location on the machine where CentraSite is running.
4. Import the Mediator's self-signed certificate mediator.cer into the above created truststore or Java cacerts.

When prompted for password, the default for truststores is password.

```
C:\deploykeystores\new>keytool -export -alias mediator
-keystore mediatorkeystore.jks -rfc -file mediator.cer
Enter keystore password:
Certificate stored in file <mediator.cer>

C:\deploykeystores\new>keytool -import -alias mediator
-keystore centrasitetruststore.jks -file mediator.cer
Enter keystore password:
Re-enter new password:
Owner:
Issuer:
Serial number:
Valid from:
Certificate fingerprints:
Trust this certificate? [no]: yes
Certificate was added to keystore
```

```
C:\deploykeystores\new>
```

If opting to import certificate in to Java cacerts, the Java runtime needs to trust the certificates of the Mediator (regardless of whether this is a Tomcat application or a standalone application) in order to establish the SSL connections. To do that, add the certificate to the trusted certificates of Java via the *keytool* utility that comes with Java. The following command will add the certificate located at a location (for example, c:\temp\server.crt) to the trusted certificates in the Java used by CentraSite:

```
keytool.exe -import -v -trustcacerts -alias test
-file "C:\temp\server.crt"
-keystore "<JDKInstallDir>\jre\lib\security\cacerts"
```

When prompted for password, the default for Java is `changeit`.

5. Export the CentraSite's self-signed certificate `centrasite.cer` in to the Mediator's truststore.
6. Open the `wrapper.conf` file located in `<CentraSiteInstallDir>/profiles/CTP/` configuration

```
<CentraSiteInstallDir>/profiles/CTP/configuration
```

7. Go to the section `#Java Additional Parameters`. Add the following property lines:

```
wrapper.java.additional.5=-Djavax.net.ssl.keyStore="C:/deploykeystores/new/centrasitekeystore.jks"
wrapper.java.additional.6=-Djavax.net.ssl.keyStorePassword=password
wrapper.java.additional.7=-Djavax.net.ssl.trustStore="C:/deploykeystores/new/centrasitetruststore.jks"
wrapper.java.additional.8=-Djavax.net.ssl.trustStorePassword=password
```

8. Set the values as needed:

```
wrapper.java.additional.5=-Djavax.net.ssl.keyStore= represents the
location of a keystore file (say, centrasitekeystore.jks).
```

```
wrapper.java.additional.6=-Djavax.net.ssl.keyStorePassword= represents
the password for a keystore.
```

```
wrapper.java.additional.7=-Djavax.net.ssl.trustStore= represents the
location of a truststore file (say, centrasitetruststore.jks).
```

```
wrapper.java.additional.8=-Djavax.net.ssl.trustStorePassword=
represents the password for a truststore.
```

9. Save and close the file.
10. Now restart the CentraSite Tomcat. All communication via the Mediator to the database should now be using SSL.

Using the CTP Server.xml File for SSL

To configure SSL using CTP server.xml file

1. Open the `server.xml` file located in the following directory:

```
<CentraSiteInstallDir>/profiles/CTP/configuration/tomcat/conf
```

2. Enter the keystore information as specified below:

```

1 <?xml version="1.0" encoding="UTF-8" ?>
2
3 <Service name="Catalina">
4   <Connector acceptCount="100" connectionTimeout="20000" description="CTP HTTP port" disableUploadTimeout="true" enableLook
5   <Connector SSLEnabled="true" acceptCount="100" algorithm="SunX509" clientAuth="false" description="CTP HTTPS port"
6   disableUploadTimeout="true" enableLookups="false"
7   keystoreFile="C:/deploykeystores/new/centrasitekeystore.jks" keystorePass="password" keystoreType="JKS"
8   maxHttpHeaderSize="8192" maxSpareThreads="75" maxThreads="150" minSpareThreads="25" port="10011" scheme="https"
9   secure="true" sslProtocol="TLS" />
10
11 <Engine defaultHost="localhost" name="Catalina">
12   <Host appBase="C:\SoftwareAG\profiles\CTP\workspace\webapps" autoDeploy="true" name="localhost" unpackWARs="true" workDir
13
14 <!--for configuring SSL s. comment for Connector for port 49982 above-->
15   <Connector description="CentraSite 8.2 HTTPS" maxHttpHeaderSize="8192" maxThreads="150" minSpareThreads="25" maxSpareThre
16
17 </Service>
18
19 </Server>

```

3. Add the Mediator certificate (mediator.cer) into CentraSite JVM cacerts as below:

```

C:\WINDOWS\system32\cmd.exe
C:\deploykeystores\new>keytool -import -alias mediator -keystore C:\SoftwareAG\jvm\jvm160_32\jre\lib\security\cacerts -file mediator.cer
Enter keystore password:
Owner: CN=pcinriya.eur.ad.sag, OU=Mediator, O=WebMethods, L=Reston, ST=VA, C=US
Issuer: CN=pcinriya.eur.ad.sag, OU=Mediator, O=WebMethods, L=Reston, ST=VA, C=US
Serial number: 4ca57bd3
Valid from: Fri Oct 01 11:42:35 IST 2010 until: Thu Jun 27 11:42:35 IST 2013
Certificate fingerprints:
MD5: E2:0D:90:2E:E4:5E:0E:08:3A:EC:72:53:47:33:98:E0
SHA1: 4F:A1:CB:8A:50:E9:BA:B2:B0:61:CD:D3:43:3F:CB:9F:5A:07:F7:F2
Signature algorithm name: SHA1withRSA
Version: 3
Trust this certificate? [no]: yes
Certificate was added to keystore
C:\deploykeystores\new>

```

Configuring webMethods Integration Server to Use SSL

The configuration settings covered in this section deal with the webMethods Integration Server side.

You configure an Integration Server to use one- or two-way SSL.

Configure Integration Server to Use One-way SSL

You perform the following procedure to configure Integration Server for one-way SSL authentication:

To configure one-way SSL

1. Using OpenSSL, create a self-signed certificate (mediator.cer) with the following command:

```
openssl req -new -x509 -days 2000 -sha1 -newkey rsa:1024 -nodes
-keyout server.key -out server.crt -subj "/O=Company/OU=Unit/CN=localhost"
```

Whatever is specified in the CN section of the subject must match the hostname of the machine running the Mediator and is used to send requests to Mediator.

2. Create at least one keystore `mediatorkeystore.jks`, in PKCS#12 or JKS format, containing an Integration Server key pair to use for SSL and its corresponding key alias.

```
C:\deploykeystores\new>keytool -v -genkeypair -alias mediator
-keyalg RSA -validity 1000 -keystore mediatorkeystore.jks
Enter keystore password:
Re-enter new password:
What is your first and last name?
What is the name of your organizational unit?
What is the name of your organization?
What is the name of your City or Locality?
What is the name of your State or Province?
What is the two-letter country code for this unit?

Enter key password for <mediator>
    <RETURN if same as keystore password>:
[Storing mediatorkeystore.jks]

C:\deploykeystores\new>
```

3. Export the Mediator's self-signed certificate `mediator.cer` into the CentraSite's truststore.
4. Configure an HTTPS port and specify the client authentication to **Username/Password**. The server prompts the client for a user ID and password.
5. On the **Ports** screen, click **Edit** to change the **Access Mode**. You may Set Access Mode to **Allow by Default** or **Reset to default access settings**.

For more information on configuring ports and client authentication, see *webMethods Integration Server Administrator's Guide*.

6. Restart the Integration Server.

Configure Integration Server to Use Two-way SSL

You perform the following procedure to configure Integration Server for one-way SSL authentication:

To configure two-way SSL

1. Using OpenSSL, create a self-signed certificate (`mediator.cer`) with the following command:

```
openssl req -new -x509 -days 2000 -sha1 -newkey rsa:1024 -nodes
-keyout server.key -out server.crt -subj "/O=Company/OU=Unit/CN=localhost"
```

Whatever is specified in the CN section of the subject must match the hostname of the machine running the Mediator and is used to send requests to the Mediator.

2. Create at least one keystore `mediatorkeystore.jks`, in PKCS#12 or JKS format, containing an Integration Server key pair to use for SSL.

```
C:\deploykeystores\new>keytool -v -genkeypair -alias mediator
-keyalg RSA -validity 1000 -keystore mediatorkeystore.jks
Enter keystore password:
Re-enter new password:
What is your first and last name?
What is the name of your organizational unit?
```

```

What is the name of your organization?
What is the name of your City or Locality?
What is the name of your State or Province?
What is the two-letter country code for this unit?

Enter key password for <mediator>
    <RETURN if same as keystore password>:
[Storing mediatorkeystore.jks]

C:\deploykeystores\new>

```

3. Create at least one truststore mediatortruststore.jks, in JKS format, in a desired location on the machine where CentraSite is running.
4. Export the Mediator's self-signed certificate mediator.cer into the CentraSite's truststore.
5. Import the CentraSite's self-signed certificate centrasite.cer in to the Mediator's truststore mediatortruststore.jks.

```

C:\deploykeystores\new>keytool -export -alias
centrasite -keystore centrasitekeystore.jks -rfc -file
centrasite.cer
Enter keystore password:
Certificate stored in file <centrasite.cer>

C:\deploykeystores\new>keytool -import -alias
mediator -keystore mediatortruststore.jks -file
centrasite.cer
Enter keystore password:
Re-enter new password:
Owner:
Issuer:
Serial number:
Valid from:
Certificate fingerprints:
    Trust this certificate? [no]: yes
Certificate was added to keystore

C:\deploykeystores\new>

```

6. Create a keystore and truststore alias using the above created keystore (mediatorkeystore.jks) and truststore (mediatortruststore.jks) respectively. For more information on creating keystore and truststore aliases, see *webMethods Integration Server Administrator's Guide* in the documentation set for webMethods Integration Server.
7. Configure an HTTPS port and specify the client authentication to any of the following:
 - **Username/Password.** The server prompts the client for a user ID and password.
 - **Request Client Certificates.** The server requests client certificates for all requests. If the client does not provide a certificate, the server prompts the client for a user ID and password. If the client provides a certificate:

- The server checks whether the certificate exactly matches a client certificate on file and is signed by a trusted authority. If so, the client is logged in as the user to which the certificate is mapped in Integration Server. If not, the client request fails, unless central user management is configured.
 - If central user management is configured, the server checks whether the certificate is mapped to a user in the central user database. If so, the server logs the client on as that user. If not, the client request fails.
 - **Require Client Certificates.** The server requires client certificates for all requests. The server behaves as described for Request Client Certificates, except that the client must always provide a certificate.
8. On the **Ports** screen, click **Edit** to change the **Access Mode**. You may Set Access Mode to Allow by Default or Reset to default access settings.
 9. If chosen client authentication as **Require Client Certificates** above, map the client certificate to any valid user in the Integration Server.

For more information on configuring ports and client authentication, see *webMethods Integration Server Administrator's Guide*.
 10. Restart the Integration Server.

Configuring webMethods Mediator to Use SSL

Configure your instance of webMethods Mediator as described in *Administering webMethods Mediator*.

4 Virtualized APIs in CentraSite Business UI

■ Introduction to Virtual APIs	166
■ Who Can Create and Manage Virtual APIs?	166
■ Preparing to Virtualize and Publish APIs	167
■ Run-Time Components of Virtual API	168
■ Creating Virtualized APIs	181

■ Managing Your API Keys	240
■ Privileged User of a Virtual API	245

Introduction to Virtual APIs

API Providers (owners of the API) and API Consumers (consumers of the API) use the CentraSite Business UI to browse and search for APIs in CentraSite by name, description, attribute values, asset types and/or taxonomy groups. Additionally, the API providers can virtualize and publish APIs to the run-time layer; while the API consumers can invoke (call) the APIs that are exposed to them.

This topic describes how to:

- Create and configure virtual APIs in the CentraSite catalog.
- Publish virtual APIs to the webMethods Mediator and webMethods API-Portal gateways.
- Consume APIs using the API key or OAuth2 client access token.

Instructions throughout the remainder of this document use the term "API" when referring to the three base types (Service, XML Service, REST Service), and "Virtual API" when referring to its three virtual types (Virtual Service, Virtual XML Service, and Virtual REST Service) in general.

Who Can Create and Manage Virtual APIs?

To create and manage virtual APIs, you must belong to the following roles:

- CentraSite Administrator
- API Runtime Provider (required to configure run-time actions for the virtual APIs)
- Mediator Publisher (required to publish virtual APIs to Mediator gateways)
- API-Portal Administrator (required to publish virtual APIs to API-Portal gateways)

Note: If a user has View permission on an API and Create Assets permission within their own organization, he or she can virtualize the particular API. However, the user will not be permitted to configure the run-time actions for the API that is virtualized unless he or she also has the API Runtime Provider role. Only users with API Runtime Provider role can configure these run-time actions. Similarly, the user will not be permitted to publish the virtual API to Mediator or API-Portal gateway, unless he or she has the Mediator Publisher role or API-Portal Administrator role for the organization, or at least the Modify instance-level permission on the gateway itself.

For more information about roles and permissions, see *Getting Started with CentraSite*.

Preparing to Virtualize and Publish APIs

Before API providers can publish APIs to Mediator and API-Portal gateways, some additional steps are required. The following table lists these high-level steps and where to go for more information:

Step	Where to Go for Procedures
<p>(Specific for API-Portal) Configure design-time and change-time policies using the predefined policies Publish to API-Portal and Unpublish from API-Portal.</p> <p>This step is needed only if your organization requires design-time governance.</p>	<p>Section on the design/change-time policies for API-Portal in <i>Working with the CentraSite Business UI</i>.</p>
<p>Set up approval and onboarding workflows in CentraSite.</p>	<p>Section on the predefined policies for API management in <i>Working with the CentraSite Business UI</i>.</p>
<p>Create the native SOAP or REST API (asset) in CentraSite.</p>	<p>Sections on creating a SOAP API asset in <i>Working with the CentraSite Business UI</i> and REST API asset in <i>Working with REST-based APIs in CentraSite</i>.</p>
<p>Create a new virtual API (alias) for the native API.</p>	<p>Section on creating a virtual API in "Creating Virtualized APIs" on page 181.</p>
<p>Configure the run-time actions to enforce for the virtual API you want to expose.</p>	<p>Section on assigning actions to a virtual API in "Assign Run-Time Actions for the Virtual SOAP API" on page 183.</p>
<p>Ensure that the run-time policies for the virtual API are active.</p>	<p>Section on activating a run-time policy in <i>Working with the CentraSite Business UI</i>.</p>
<p>Configure consumption settings for the native API.</p>	<p>Section on configuring the API consumption settings in API key management policies in <i>Working with the CentraSite Business UI</i>.</p>

Step	Where to Go for Procedures
Create an instance of Mediator gateway, for example, webMethods Mediator in CentraSite.	Section on adding and registering a Mediator instance with CentraSite.
Create an instance of API-Portal gateway, for example, webMethods API-Portal in CentraSite.	Section on adding and registering an API-Portal instance with CentraSite in <i>Working with the CentraSite Business UI</i> .
Publish the API to Mediator and webMethods API-Portal gateways.	Section on publishing an API to both the Mediator and webMethods API-Portal gateways in " Publishing and Unpublishing APIs to and from Gateways " on page 200

If these conditions are not satisfied, all or part of the publish user interface controls will be disabled when you view the API in CentraSite Business UI.

Run-Time Components of Virtual API

The run-time behavior of a virtual API is defined by the following components:

- Policy Accordions
- Run-Time Actions
- Message Flow Stages

Summary of the Policy Accordions

The policy actions are classified into one of the following accordions:

Accordion	Use to...
Request Handling	Request handler allows receiving and transforming the incoming message from a client into a custom format as expected by the native API. For example, a Require HTTP / HTTPS action mandates that the incoming requests for an API are received over the HTTP and/or HTTPS protocol.
Policy Enforcement	Enforces the adherence to real-time policy compliance identifying/authenticating, monitoring, auditing, and measuring and collecting result statistics for an API.

<u>Accordion</u>	<u>Use to...</u>
Response Processing	Response handler allows processing of the response message coming from the native API into a custom format as expected by the client.
Error Handling	Error handlers are used to format and return error messages. Errors can occur at run-time for various reasons. For example, security errors occur if a username is not correctly validated or authorized; transformation errors occur if transformation action is unable to successfully transform a message; a routing error is raised if a routing endpoint is unavailable, and so on.

Summary of the Run-Time Actions

Actions are the core elements of stages in a message flow that define the handling of messages as they flow through a virtual API. The following table lists the actions you can configure for the virtual API's message flow, and links you to topics that describe the actions, including how to configure them.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
Request Handling > Protocol			
"Require JMS" on page 439	Specify the JMS protocol for the API to accept and process the requests.	Receive	<ul style="list-style-type: none"> ■ SOAP APIs.
"Require HTTP / HTTPS" on page 438	Specify the HTTP and/or HTTPS protocol and the SOAP format (for a SOAP-based API) for the API to accept and process the requests.	Receive	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Request Transformation" on page 435	Invoke an XSL transformation in the incoming request before it is	Receive	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
	submitted to the an API.		
"Invoke webMethods Integration Server" on page 414	Invoke a webMethods Integration Server service to pre-process the request before it is submitted to the an API.	Receive	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
Enable REST Support	Enables REST support for an existing SOAP based API by exposing the API both as a REST based API as well as a SOAP API. Clients who can only send REST requests can now invoke a REST-enabled SOAP API using a REST request.	Receive	<ul style="list-style-type: none"> ■ SOAP APIs.
	Note This action is enabled by default for SOAP APIs.		
Set Media Type	Specifies the content type for a REST request received from a client if the content type header is not specified. This action is applicable to a SOAP API only if Enable REST Support is set.	Receive	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
Policy Enforcement > Authentication			
"HTTP Basic Authentication" on page 413	Identify and validate the consumer's authentication credentials contained in the request's Authorization header using HTTP basic authentication mechanism.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"NTLM Authentication" on page 431	Identify and validate the consumer's authentication credentials contained in the request's Authorization header using NTLM authentication mechanism.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"OAuth2 Authentication" on page 433	Identify and validate the consumer's authentication credentials contained in the request's Authorization header using OAuth 2.0 authentication mechanism.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
Policy Enforcement > JMS Routing			

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"JMS Routing Rule" on page 415	Specify a JMS queue to which the Mediator is to submit the request, and the destination to which the an API is to return the response.	Routing	■ SOAP APIs.
"Set Message Properties" on page 446	Specify JMS message properties to authenticate client requests before submitting to the an APIs.	Routing	■ SOAP APIs.
"Set JMS Headers" on page 444	Specify JMS headers to authenticate client requests before submitting to the an APIs.	Routing	■ SOAP APIs.
Policy Enforcement > Logging and Monitoring			
"Log Invocation" on page 422	Log request/response payloads to a destination you specify.	Enforce	■ SOAP APIs. ■ REST APIs.
"Monitor Service Performance" on page 427	Monitor the run-time performance for a specific consumer, and defines the level of performance that the specified consumer should expect from the API.	Enforce	■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"Monitor Service Level Agreement" on page 424	Monitor a user-specified set of run-time performance conditions for an API, and sends alerts to a specified destination when these performance conditions are violated.	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

Policy Enforcement > Routing

"Straight Through Routing" on page 447	Route requests directly to a native endpoint that you specify.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Content Based Routing" on page 389	Route requests to different endpoints based on specific values that appear in the request message.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Load Balancing and Failover Routing" on page 418	Routes the requests across multiple endpoints.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Context Based Routing" on page 393	Route requests to different endpoints based on specific values that appear in the request message.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Set Custom Headers" on page 443	Specify the HTTP headers to process the requests.	Routing	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

Policy Enforcement > Security

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"Require SSL" on page 441	Mandate that requests be sent via SSL client certificates, and can be used by both SOAP and REST APIs.	Enforce	■ SOAP APIs.
"Require Signing" on page 440	Mandate that a request's XML element (which is represented by an XPath expression) be signed.	Enforce	■ SOAP APIs.
"Require Encryption" on page 436	Mandate that a request's XML element (which is represented by an XPath expression) be encrypted.	Enforce	■ SOAP APIs.
"Require Timestamps" on page 442	Mandate that timestamps be included in the request header.	Enforce	■ SOAP APIs.
"Require WSS SAML Token" on page 442	Uses a WSS Security Assertion Markup Language (SAML) assertion token to validate API consumers.	Enforce	■ SOAP APIs.
"Evaluate HTTP Basic Authentication" on page 405	<ul style="list-style-type: none"> ■ Identify the consumer against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
	<p>list (the list of available users in Mediator).</p> <ul style="list-style-type: none"> ■ Validate the client's authentication credentials contained in the request's Authorization header against the list of users in the Integration Server on which Mediator is running. 		
<p>"Evaluate Hostname" on page 404</p>	<ul style="list-style-type: none"> ■ Identify the consumer against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator). ■ Validate the client's IP address against the list of users in the Integration Server on which Mediator is running. 	<p>Enforce</p>	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
<p>"Evaluate IP Address" on page 407</p>	<ul style="list-style-type: none"> ■ Identify the consumer against either the Registered Consumers 	<p>Enforce</p>	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"Evaluate WSS Username Token" on page 409	<p>list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator).</p> <ul style="list-style-type: none"> ■ Validate the client's IP address against the list of users in the Integration Server on which Mediator is running. 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs.
"Evaluate WSS X.509 Certificate" on page 410	<ul style="list-style-type: none"> ■ Identify the consumer against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator). ■ Validate the client's WSS username token against the list of users in the Integration Server on which Mediator is running. 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
	<p>Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator).</p> <ul style="list-style-type: none"> ■ Validate the client's WSS X.509 token against the list of users in the Integration Server on which Mediator is running. 		
"Evaluate XPath Expression" on page 411	<ul style="list-style-type: none"> ■ Identify the consumer against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator). ■ Validate the client's XPath expression against the list of users in the Integration Server on which Mediator is running. 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Evaluate OAuth2 Token" on page 408	<ul style="list-style-type: none"> ■ Identify the consumer against either the Registered 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"Evaluate Client Certificate for SSL Connectivity" on page 403	<p>Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator).</p> <ul style="list-style-type: none"> ■ Validate the client's IP address against the list of users in the Integration Server on which Mediator is running. ■ Identify the consumer against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available users in Mediator). ■ Validate the client's certificate against the list of users in the Integration Server on which Mediator is running. 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

Policy Enforcement > Traffic Management

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"Throttling Traffic Optimization" on page 451	<ul style="list-style-type: none"> ■ Limit the number of API invocations during a specified time interval, and sends alerts to a specified destination when the performance conditions are violated. ■ Avoid overloading the back-end services and their infrastructure, to limit specific consumers in terms of resource usage, etc. 	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
"Service Result Cache" on page 454	Enables caching of the results of SOAP and REST API invocations.	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
Policy Enforcement > Validation			
"Validate Schema" on page 457	Validate all XML request and/or response messages against an XML schema referenced in the WSDL.	Enforce	<ul style="list-style-type: none"> ■ SOAP APIs.
Response Processing			
"Response Transformation" on page 434	Invoke an XSL transformation in the SOAP response payloads from XML format to the format required by the consumer.	Response	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

<u>This action...</u>	<u>Use to...</u>	<u>Available in Message Flow Stage...</u>	<u>Applicable for...</u>
"Invoke webMethods Integration Server" on page 414	Invoke a webMethods Integration Server service to process the response from the an API before it is returned to the consumer.	Response	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
Set Media Type	Specifies the content type for a REST response. This action is applicable to a SOAP API only if Enable REST Support is set in the Request Handling step.	Response	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.

Error Handling

"Conditional Error Processing" on page 398	Return a custom error message (and/or the native provider's service fault content) to the consumer when the native provider returns a service fault.	Response	<ul style="list-style-type: none"> ■ SOAP APIs. ■ REST APIs.
--	--	----------	--

For detailed descriptions about the individual run-time actions that CentraSite out-of-the-box, see ["Built-In Run-Time Actions Reference for Virtual Services" on page 333](#).

Summary of the Message Flow Stages

Message Flow defines the implementation of a virtual API.

A message flow is a sequence of stages representing a non-branching one-way processing path. Message flow is used for request, enforce, routing and response paths as well as for error handlers.

A message flow tree is constructed by chaining together actions of these top-level stages:

Stage	Description
Receive	Request stage is used for processing the request path of the Message Flow.
Enforce	Enforce stage is used for processing the enforcement path of the Message Flow. The enforce stage is used to identify and validate specific consumers invoking APIs, throttle traffic, log request/response payloads, and monitor run-time performance conditions.
Routing	Routing stage is used for processing the routing path of the Message Flow. The routing stage is used to perform request-response communication. It represents the boundary between request and response processing for the API. When the routing stage dispatches a request message, request processing is considered finished. When the routing stage receives a response message, response processing begins.
Response	Response stage is used for processing the response path of the Message Flow. In addition, response stage is used as error handler.

Creating Virtualized APIs

Before You Begin

To virtualize and publish a Virtual API, the following prerequisites must be met:

- Make sure that you have the roles and permissions required for creating virtualized APIs.
- Ensure that the webMethods Mediator is configured and running on the same machine webMethods Integration Server.
- *Applicable for OAuth2 scenarios.* Ensure that the Mediator property `watt.server.auth.skipForMediator` is set to `true`. For details, see "[The `watt.server.auth.skipForMediator` Property](#)" on page 336.

Creating a Virtualized API from an Existing Native API

To create a new virtualized API from an existing API, perform the following high-level steps:

Creating a Virtual SOAP API

To create a Virtual (SOAP-based) API, also called as a Virtual Service in CentraSite, from an existing Native (Web) Service, proceed as follows:

Add a Virtual SOAP API

You use the panel 1 of the Virtualize your API page to specify the proxy and invocation aliases, and endpoints for the new Virtual API.

To add a Virtual SOAP API

1. Display the list of Web services, by executing an advanced search for **Service** asset type (see *Working with the CentraSite Business UI* for details).
2. In the displayed list, click the link of the Web service for which you want to create a virtual copy. This shows the profile details of the Web service.
3. In the details page of the Web service, click the **Virtualize** icon.
4. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, complete the fields.

In this field...

Create a New Virtual Alias

Do the following...

Enter a name for the new virtual alias.

This name must be NCName-conformant, meaning that:

- The name must begin with a letter or the underscore character (`_`).
- The remainder of the name can contain any combination of letters, digits, or the following characters: `. - _` (that is, period, dash, or underscore). It can also contain combining characters and extender characters (for example, diacriticals).
- The name cannot contain any spaces.
- Furthermore, if the Virtual API name contains any non-conformant character, upon publishing the Virtual API to any gateway, the non-conformant character is simply replaced with the underscore character (`_`) in Mediator. However, in CentraSite the Virtual API name defined by you is displayed.

For more information about the NCName type, see <http://www.w3.org/TR/xmlschema-2/#NCName>

An API name does not need to be unique within the registry. However, if for example, a Virtual API with the same name already exists within the native API, a warning message will be issued.

In this field...	Do the following...
Endpoint prefix for invocation alias	<p>By default, CentraSite populates the Create a New Virtual Alias field with the display name that was specified for the native API.</p> <p><i>Optional.</i> Enter a prefix for the alias. It accepts URL paths. For example, <code>/testmethod/myprefix/</code>, <code>test@1234</code>, and so on.</p>
Endpoints of <API_name> to be virtualized	<p>Select the endpoint that you want to use for invoking the Virtual API.</p> <p>The Endpoints list displays the URLs of all endpoints that are available for the native API.</p>

5. Click **Next** to complete the settings.

Assign Run-Time Actions for the Virtual SOAP API

You use the panel 2 of the Virtualize your API page to configure the policy actions for the Virtual API.

1. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, drag and drop the policy actions that you want CentraSite to execute for the Virtual API at run-time.
2. Configure the parameters for each action as described in "[Assigning Run-Time Actions to a Virtualized API](#)" on page 197, and then click **Next**.

Implement Virtualization and Publish the Virtual SOAP API to Gateways

You use the panel 3 of the Virtualize your API page to configure the gateways for publishing the Virtual API. The publishing operation allows the API Providers to expose the Virtual API in the selected gateways. Clients can then access and examine the usage of the exposed Virtual API.

1. In the **Virtualize <API_Name> (Step 3 of 3)** wizard, display the list of available gateways that are available to you.
2. In the **Gateway** drop-down box, choose the gateways (for example, API-Portal, Mediator, or Insight) to publish the Virtual API.
3. In the **Sandbox** drop-down box, choose the category by which the gateways were classified.
4. Mark the checkbox of each gateway to which you want to publish the Virtual API.
5. Applicable for an API-Portal gateway only. Configure a set of sandbox categories for publishing the Virtual API to the specified sandbox categories of the API-Portal gateways. Do the following:

- a. Click the **Configure** icon next to **Sandbox** field.
 - b. In the **API-Portal Settings** dialog box, select the sandbox category to which you want to publish the Virtual API.
6. Applicable for a Mediator/Insight gateway only. Select the **Expose to Consumers** option to allow clients to simply access and examine the usage of the exposed Virtual API.
 7. Click **Virtualize** to create the virtual copy (proxy) of the Web Service (without publishing the newly created Virtual API to the selected gateways). This opens the details page of the newly created Virtual API.

The details page for the Virtual API that you just created is displayed.

- Else, click **Publish** to create the virtual copy of the Web Service and simultaneously publish the newly created Virtual API to the selected gateways.

Creating a Virtual REST API

To create a Virtual REST API, also called as a Virtual REST Service in CentraSite, from an existing Native REST Service, proceed as follows:

Add a Virtual REST API

You use the panel 1 of the Virtualize your API page to specify the proxy and invocation aliases, and endpoints for the new Virtual REST API.

1. Display the list of REST APIs, by executing an advanced search for **REST Service** asset type (see *Working with the CentraSite Business UI* for details).
2. In the displayed list, click the link of the REST API for which you want to create a virtual copy. This shows the profile details of the REST API.
3. In the actions bar of the REST API, click the **Virtualize** icon.
4. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, complete the fields. The fields displayed for a Virtual REST API are the same as for the Virtual SOAP API, so for a description of the fields, follow the instructions provided above for "[Creating a Virtual SOAP API](#)" on page 182.
5. In the **Resources of <API_name> to Virtualize** field, select the resources you want to use for the Virtual REST API or select "**All**" if you want to use all of the available resources.
6. Click **Next** to complete the settings.

Assign Run-Time Actions for the Virtual REST API

You use the panel 2 of the Virtualize your API page to configure the policy actions for the Virtual REST API.

The fields displayed for a Virtual REST API are the same as for the Virtual API, so for a description of the fields, follow the instructions provided above for "[Creating a Virtual SOAP API](#)" on page 182.

Implement Virtualization and Publish the Virtual REST API to Gateways

You use the panel 3 of the Virtualize your API page to configure the gateways for publishing the Virtual REST API. The publishing operation allows the API Providers to expose the Virtual REST API in the selected gateways. Clients can then access and examine the usage of the exposed Virtual REST API.

The fields displayed for a Virtual REST API are the same as for the Virtual API, so for a description of the fields, follow the instructions provided above for "[Creating a Virtual SOAP API](#)" on page 182.

Reconfiguring a Virtualized API

This section describes how to use the **Virtualize** action to reconfigure virtualized APIs that were created using an existing native API or from scratch in the CentraSite registry.

To access the **Virtualize** action in the details page of native API or virtualized API, you must have the following roles or permissions:

- CentraSite Administrator
- Organization Administrator
- Asset Provider
- Instance-level Modify permission on the native API or virtualized API

In addition to the above described roles and permissions for managing a particular virtualized API, make sure that you have the specific roles and permissions required for reconfiguring the run-time actions and republishing the virtualized APIs to Mediator and API-Portal gateways as specified in "[Who Can Create and Manage Virtual APIs?](#)" on page 166.

For details about roles and permissions, see *Getting Started with CentraSite*.

Reconfiguring a Virtualized API

To reconfigure a virtualized API from the details page of a particular native API, proceed as follows:

1. Display the list of native APIs (see *Working with the CentraSite Business UI* for details).
2. In the displayed list, click the link of the native API whose related virtualized API you want to reconfigure. This shows the details of the native API.
3. In the actions bar for the native API, click **Virtualize**.

This opens the **Virtualize <API_Name> (Step 1 of 3)** wizard.

- In the **Reconfigure an Existing Virtual Alias** field, select the virtualized API (also called as the Virtual Alias) you want to reconfigure. Complete the fields.

<u>In this field...</u>	<u>Do the following...</u>
Endpoint prefix for invocation alias	<p><i>Optional.</i> Enter a prefix for the alias. It accepts URL paths.</p> <p>For example, /testmethod/myprefix/, test@1234, and so on.</p>
Endpoints of <API_name> to be virtualized	<p>Select the endpoint you want to use for invoking the virtualized API.</p> <p>The Endpoints list displays the URLs of all endpoints that are available for the native API.</p>
Resources	<p>Select the resources you want to apply for invoking the virtualized API. For more information about using this field, see "Resource Synchronization in Virtual REST APIs" on page 186.</p>

- If you want to modify the run-time policy actions that are configured for the virtualized API, click **Next**.

In the **Virtualize <API_Name> (Step 2 of 3)** wizard, drag and drop the policy actions, and reconfigure the action parameters.

Then click the **Virtualize** button to save the changes.

If you want to make changes related to the gateways, follow the instructions in "[Publishing and Unpublishing APIs to and from Gateways](#)" on page 200.

Resource Synchronization in Virtual REST APIs

REST APIs are bound to change and evolve over time as they move through development, test and production. Modifications or enhancements such as, adding additional resources, HTTP methods or parameters, modifying the existing capabilities of resources, methods or parameters are performed on a particular REST API. In the case of a REST API that is virtualized to create a new Virtual REST API, keep in mind that the Virtual REST API which is newly created is an identical copy of the existing Native REST API and not just a reference REST API. This means that after a Virtual REST API is created, any subsequent changes in the Native REST API are not automatically propagated to the Virtual REST API. This means that if you add Resource B to the Native REST API, the newly added Resource B is not added to the existing Virtual REST API.

CentraSite Business UI offers the possibility of synchronizing the REST resource metadata for a Virtual REST API.

Note that there is no automatic synchronization of resource metadata between the REST API and the Virtual REST API. If you want to have the resource metadata in the Virtual REST API to be the same as the resource metadata in the REST API, you must manually reconfigure the resource metadata in the Virtual REST API to synchronize with the resources in the REST API.

The user must have API Runtime Provider role to manage synchronization for the specified Virtual REST API.

When planning for the resource synchronization in Virtual REST API, as a best practice, take the following points into consideration:

- If you want to simply reconfigure the run-time policy action configurations for a particular Virtual REST API, we recommend that you use the **Virtualize** action in the details page of that Virtual REST API.
- If you want to reconfigure the alias field labeled **Endpoint prefix for invocation alias** or synchronize resources for a particular Virtual REST API, we then recommend that you use the **Virtualize** action in the details page of that Native REST API.
- Be aware that only the additions and deletions at the resource-level are recognized by the **Virtualize** action during reconfiguration of a Virtual REST API. Any changes that are made at the API-level and method-level are not recognized.

When you allow synchronization to happen on the Virtual REST API, the updated metadata of the Native REST API will completely overwrite the existing metadata of the Virtual REST API.

For example, if you have a Native REST API with two resources - Resource A and Resource B. Consider these two resources have the following methods:

Resource A	Resource B
GET Method	GET Method
POST Method	PUT Method

Assume you virtualize the Native REST API to create a Virtual REST API.

The Virtual REST API will include the two resources - Resource A and Resource B with the above specified methods.

Consider you update the details page of the Native REST API to include an additional metadata "*DELETE Method*" to the existing Resource B. The Native REST API will now have the two resources with the following methods:

Resource A	Resource B
GET Method	GET Method
POST Method	PUT Method
	<i>POST Method</i>

Consider you update the details page of the Virtual REST API to include an additional metadata "*DELETE Method*" to the Resource B. The Virtual REST API will now have the two resources with the following methods:

Resource A	Resource B
GET Method	GET Method
POST Method	PUT Method
	<i>DELETE Method</i>

When you reconfigure the Virtual REST API from the details page of the Native REST API, in the **Recreate resources** section, CentraSite displays both the resources - Resource A and Resource B (with a comment "already exists") with pre-selected check boxes by default.

Note that the Resource B has a different set of method specification for the Native and Virtual REST APIs. However, on reconfiguring the Virtual REST API, this difference of the method specification is not recognized in the user interface.

Now when you choose to reconfigure the Virtual REST API with the default selection, upon synchronization, the existing metadata of the Virtual REST API will be completely overwritten by the updated metadata of the Native REST API. As a result, the Resource B of the Virtual REST API will now contain the inherited **POST Method**; but the user-defined **DELETE Method** will no longer exist.

Important: As a best practice, we recommend that you maintain the Native REST API as the single point of truth and synchronize all your changes with the Virtual REST API using the synchronization process.

Resource Synchronization Usage Scenarios

There are significant use cases that require real-time and accurate data synchronization. Consider a REST API allows users access to a collection of resources through a Virtual REST API. The goal is to keep the data on the Virtual REST API synchronized with the

data of Native REST API. Types of use cases that are contemplated within the scope of the synchronization are exemplified by, but not limited to, the following scenarios:

- **Edit Resource Usage Scenario:** You choose to reconfigure an existing Virtual REST API, and the Native REST API indicates resources that are also available in the Virtual REST API. For an exemplary illustration, see "[Edit Resource Usage Scenario](#)" on page 189.
- **Add Resource Usage Scenario:** You choose to reconfigure an existing Virtual REST API, and the Native REST API indicates resources that have been introduced since the Virtual REST API was initially created. For an exemplary illustration, see "[Add Resource Usage Scenario](#)" on page 190.
- **Delete Resource Usage Scenario:** You choose to reconfigure an existing Virtual REST API, and the Native REST API indicates resources that have been deleted since the Virtual REST API was initially created. For an exemplary illustration, see "[Delete Resource Usage Scenario](#)" on page 190.
- **Combination Usage Scenario:** You choose to reconfigure an existing Virtual REST API, and the Native REST API indicates resource metadata that has undergone various changes (modifications, additions, deletions) since the Virtual REST API was initially created. For an exemplary illustration, see "[Combination of Usage Scenarios](#)" on page 191.

The outcome of each operation (edit, add, and delete) on the resource metadata is given based on a very simple instance configuration in each of the usage scenarios.

Key	Description
Native REST API	An instance of the type "REST Service"
Virtual REST API	An instance of the type "Virtual REST Service"

Edit Resource Usage Scenario

Native REST API	Virtual REST API
Resource A	Resource A (already exists)
Resource B (updated)	Resource B (already exists)

In this scenario, CentraSite displays the Resource A and Resource B that are available in both the Native REST API and the Virtual REST API with pre-selected check boxes.

- To allow synchronization of the updated resource metadata (that is, include the modification to Resource B in the Virtual REST API), under the **Recreate resources** section, retain the default check box selection, and click **Next**.
- To ignore synchronization, under the **Recreate resources** section, unselect all of the check boxes, and click **Next**.

Add Resource Usage Scenario

Native REST API	Virtual REST API
Resource A	Resource A (already exists)
Resource B	Resource B (already exists)
Resource C (newly added)	Resource C (newly added)

In this scenario, CentraSite displays the Resource C which has been newly added to the Native REST API with a unselected check box.

- To allow synchronization of the newly added resource (that is, add the new Resource C to the Virtual REST API), under the **Recreate resources** section, select the check box of the newly added Resource C, and click **Next**.
- To ignore synchronization, under the **Recreate resources** section, unselect all of the check boxes, and click **Next**.

Delete Resource Usage Scenario

Native REST API	Virtual REST API
Resource A	Resource A (already exists)
Resource B (deleted)	Resource B (differences)

In this scenario, CentraSite displays the Resource B which has been deleted from the Native REST API with a unselected check box.

- To allow synchronization of the deleted resource metadata (that is, delete the Resource B from the Virtual REST API), under the **Resource differences** section, select the check box of the Resource B you want to delete, and click **Next**.
- To ignore synchronization, keep all of the check boxes unselected in the **Recreate resources** and **Resource differences** sections, and click **Next**.

Combination of Usage Scenarios

Native REST API	Virtual REST API
Resource A (deleted)	Resource A (differences)
Resource B (updated)	Resource B (already exists)
Resource C (added)	Resource C (newly added)

In this scenario, CentraSite displays the updated Resource B with a pre-selected check box, and the deleted Resource A and newly added Resource C with an unselected check box.

The resource synchronization mechanism can be best understood with the following table:

Use case	Recreate resources...			Resource differences...		
	Resource A	Resource B	Resource C	Resource A	Resource B	Resource C
Complete synchronization	N/A	✓	✓	✓	N/A	N/A
Synchronize modified resource only	N/A	✓	✓	✓	N/A	N/A
Synchronize added resource only	N/A	✓	✓	✓	N/A	N/A
Synchronize deleted resource only	N/A	✓	✓	✓	N/A	N/A
No synchronization	N/A	✓	✓	✓	N/A	N/A

Viewing or Changing a Virtual API

This section describes how to view the information stored for a virtual API and how to change them.

When editing the details of a virtual API, keep the following general points in mind:

- If you are not the owner of the API, you cannot edit the virtual API unless you have Modify permission on that API (granted though either a role-based permission or an instance-level permission).
- When you view the details for the API, you will only see profiles for which you have View permission. You will only be able to edit the profiles on which you have Modify permission.
- Some attributes are designed to be read-only and cannot be edited even if they appear in a virtual API on which you have Modify permission.
- Some attributes accept only specific types of information.
- Some attributes are designed to be read-only and cannot be edited even if they appear in an API on which you have Modify permission.
- *This is of specific relevance to virtual REST APIs.* Beginning with version 9.7, CentraSite supports the enhanced interface for REST APIs (in contrast, earlier versions of CentraSite supported a standardized interface for virtual REST APIs). Documentation of the prior REST and XML service interface is available to Software AG customers who have a current maintenance contract in Empower, Software AG's global extranet (<http://empower.softwareag.com/>).
- If you have virtual REST APIs that were created prior to version 9.7 or if you are using the current version of CentraSite Business UI, you will only be able to view details of these APIs in CentraSite Control. You cannot edit virtual REST API using the CentraSite Control user interface (not even if you belong to the CentraSite Administrator role). This is because; CentraSite Control does not support the enhanced REST interface. You will only be able to edit virtual REST API using the CentraSite Business UI.

To view or modify the details that you have stored for a virtual API, proceed as follows:

To view or modify a virtual API's details

1. Display the list of APIs (see *Working with the CentraSite Business UI* for details).
2. In the displayed list, click the link of the API whose details you want to view. This shows the details of the API.

The details include:

- The API's basic information (version number, the asset type, owning organization, the current lifecycle state, the last modified date, owning user, the

total number of watchers, consumers and pending approvals for the API, and a general description of the API).

In addition, if the API has one or more associated APIs, the basic information also includes the following details:

Attribute	Description
Virtual Services	<p>Displays the virtual APIs that are associated to a native API.</p> <p>If the native API has a single virtual API associated to it, this attribute displays the name of that particular virtual API. If the native API has more than one virtual API associated to it, then this attribute simply displays the count of the associated virtual APIs. When you click this count, CentraSite lists the associated virtual APIs.</p>
Native Service	Displays the native API to which a virtual API is associated.

- Additional information about the API (for example, technical and specification details, provider and consumer information, Mediators to which the API is published and so on.)
3. If you want to modify the organization's details that are displayed in the **Basic Information** section, click the **Edit** icon. You can then enter new values for the API's fields.
 4. If you want to make changes related to the extended attributes of the API, do the following:
 - a. Select the profile that contains the attribute(s) that you want to modify.
 - b. Edit the attributes on the profile as necessary.
 - c. Repeat steps 3.a and 3.b for each profile that you want to edit.
 5. Then click the **Save** icon to save the changes.
 6. To modify the run-time actions configured for the virtual API, do the following:
 - a. Navigate to the **Virtualize <API_Name> (Step 2 of 3)** wizard.
 - b. To add an action to the **Message Flow** area, do the following:
 - a. In the **Policy Actions** area, expand the desired accordion (Request Handling, Policy Enforcement, Response Handling or Error Handling).
 - b. Locate the action you want to add for the virtual API.
 - c. Drag and drop the action in the appropriate stage (Receive, Enforce, Routing or Response) in **Message Flow** area.
 - d. Repeat the above steps for each action that you want to add.

- c. To reconfigure an existing action in the **Message Flow** area, do the following:
 - a. In the **Message Flow** area, locate and mouse hover the action whose parameters you want to modify.
 - b. Choose the **Configure**  icon to the right of the action name.
 - c. In the <action name> dialog box, set the values for the parameters as necessary.
 - d. Click **OK** to save the parameter settings.
 - e. Repeat the above steps for each action that you want to modify.
7. Remove an action from the **Message Flow** area using the **Delete**  icon to the right of the action name.
8. To publish or unpublish the virtual API to one or more gateways, do the following:
 - a. Navigate to the **Virtualize <API_Name> (Step 3 of 3)** wizard.
 - b. Select or unselect the gateways from that you want to publish or unpublish the virtual API.
 - c. Click **Publish** or **Unpublish** button, appropriately. (If you do not see the **Publish** or **Unpublish** button, it is probably because you do not have permission to publish the API.)

Viewing Profile Information of an Virtual API

You have the following profile information specific to a virtual API:

- Identification Profile
- API Key Identification Profile
- API Key Scope Profile
- OAuth2 Identification Profile

Identification Profile

In this profile, you specify the precise values for the consumer identifier token(s) that you want to use for identifying consumers for the API. (Alternatively, you may configure this profile to allow unrestricted access.)

For example, if you configure the Identification profile to identify consumers by IP address, the PEP extracts the IP address from a request's HTTP header at run time and searches its list of consumers for the API that is defined by that IP address.

Note: If you want to authenticate consumers, make sure that your policy enforcement point is configured to enable authentication. For information, see *Administering webMethods Mediator*.

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In this field...	Do the following...
IPv4 Address	<p>Use this field to identify consumers based on their originating 4-byte IP address range.</p> <p>Specify a range of IPv4 addresses. Type the lowest IP address in the From field and the highest IP address in the To field. For example, 192.168.0.0 and 192.168.0.10</p> <p>The API will identify only those requests that originate from the specified IP address.</p> <p>If you need to specify additional IP addresses, use the plus button to add more rows.</p>
IPv6 Address	<p>Use this field to identify consumers based on their originating 128-bit IPv6 address.</p> <p>Specify a IPv6 address. For example, fdda:5cc1:23:4::1f</p> <p>The API will identify only those requests that originate from an IP address that lies between the specified ranges.</p> <p>If you need to specify additional IP addresses, use the plus button to add more rows.</p>
Hostname	<p>Use this field to identify consumers based on a specified host name.</p> <p>Specify the hostname. For example, pcmachine.ab.com</p> <p>The API will identify only those requests that originate from the specified host name.</p> <p>If you need to specify additional hostnames, use the plus button to add more rows.</p>
HTTP Token	<p>Use this field to authenticate consumers based on the user name that is transmitted in an HTTP authentication user token.</p> <p>Specify one or more HTTP user names. For example, SAGUser123</p> <p>The API will identify only the requests that contain the specified user name encoded and passed in the HTTP authentication user token.</p>

In this field...	Do the following...
	<p>If you need to specify additional tokens, use the plus button to add more rows.</p>
WS-Security Token	<p>Use this field to authenticate consumers based on the user name that is transmitted in the SOAP or XML message header (HTTP body).</p> <p>Specify the WSS username token. For example, <code>userwss</code></p> <p>The API will identify only the requests that contain the specified user name passed in the SOAP or XML message header.</p> <p>If you need to specify additional tokens, use the plus button to add more rows.</p>
XPath Token	<p>Use this field to identify consumers based on the result of applying an XPath expression on the SOAP or XML message or request.</p> <pre data-bbox="516 957 1302 1041"> //*[local-name()='Envelope']/* [local-name()='Body']/* [local-name()='echoInt']/* [local-name()='echoIntInput='] [.='2'] </pre> <p>The API will identify the requests that contain the XPath and the consumers.</p> <p>If you need to specify additional tokens, use the plus button to add more rows.</p>
Consumer Certificate	<p>Use this field to identify consumers based on information in an X.509 v3 certificate.</p> <p>Click Upload to locate and select the certificate (.cer) file.</p>

Identification Profile (for Assets with Key-based Authentication)

Field	Description
API Key String	<p><i>Read-only.String.</i> The confidential secret key used to securely authenticate the consumer.</p> <p>The API Key String field is visible only to the consumer who requested an API key.</p>
Expiry Date	<p><i>Read-only.String.</i> An expiration date for the API key.</p>

OAuth2 Identification Details Profile (for Assets with OAuth-based Authentication)

Field	Description
Client Id	<i>Read-only.String.</i> The unique identifier that is used by the client to fetch access tokens for the virtualized API.
Client Secret	<i>Read-only.String.</i> The secret key value that is used with the client identifier, serves as a password to fetch access tokens for the virtualized API.
Client Name	<i>Read-only.String.</i> The name of the client (consumer application) that is attempting to get access to the virtualized API.
Scope	<i>Read-only.String.</i> The scope value is the name of the virtualized API. If the scope value is valid, Mediator obtains the access token. If no scope value is provided, Mediator provides the access token to the scope in which the client is allowed and adds the scope to the response.
Refresh Token	<i>Read-only.String.</i> The unique identifier used by the client to obtain a new access token when the current access token becomes invalid or expires.

API Key Scope Profile

In this field...	Do the following...
API Service	<i>Read-only.String.</i> The name of an API that is associated with the API key. To view details of the an API, click its hyperlinked name.

Assigning Run-Time Actions to a Virtualized API

This section describes how to use the **Virtualize** action to configure the policy actions for the virtualized API.

To access the **Virtualize** action, you must have the following roles or permissions:

- CentraSite Administrator

- Organization Administrator
- Asset Provider
- Instance-level Modify permission on the native API

In addition to the above described roles and permissions for accessing the **Virtualize** action in the details page of a native API, make sure that you have the specific API Runtime Provider role for reconfiguring the run-time actions of the virtualized APIs as specified in ["Who Can Create and Manage Virtual APIs?" on page 166](#).

For details about roles and permissions, see *Getting Started with CentraSite*.

Before You Begin

The **Virtualize <API_Name> (Step 2 of 3)** wizard specifies the list of actions to govern the run-time behavior for the virtualized API.

When you define the actions for a virtualized API, keep the following points in mind:

- A run-time policy configuration is valid if:
 - it consists of at least one action in each of these stages - **Receive** and **Routing**.
 - there is a valid endpoint configured in the **Route to** field of the Routing action.
- When you drag an action from the **Policy Actions** area, the respective step in the **Message Flow** area highlights where the action fits in, thus making the navigation from **Policy Actions** area to the **Message Flow** area more intuitive.
- Not all stages support the full set of actions. Every action happens only within a respective step. For example, the "Evaluate" actions occur only on the **Enforce** stage; while the "Routing" actions occur only on the **Routing** stage.
- Mediator executes the policy actions configured for the virtualized API in a predefined order.
- Some actions are mutually dependent. That is, a specific action must be used in conjunction with another particular action. For example, a **Message Flow** area that includes the ["Set JMS Headers" on page 444](#) action must also include the ["JMS Routing Rule" on page 415](#) action.
- Some actions are mutually exclusive. That is, a specific action cannot be used in conjunction with another particular action. For example, a **Message Flow** area that includes the ["JMS Routing Rule" on page 415](#) action cannot include the ["Straight Through Routing" on page 447](#) action.
- Some of the actions are allowed to appear multiple times within a message flow step. For those actions that can appear in a message flow only once (for example, Evaluate IP Address), Mediator will choose only one, which might cause problems or unintended results.

- You can view a tooltip text for any accordion by moving the cursor over the accordion name. The tooltip text gives a summary of the accordion's purpose.
- If you modify the policy action for a virtualized API which is already published to a Mediator gateway, CentraSite automatically republishes the modified virtualized API.
- If you are using Mediator as your gateway, you must include at least one Evaluate * action in order to identify or validate the consumers. For common usage cases of identification and validation actions, see "[Usage Cases for Identifying/Authenticating Clients](#)" on page 387.
- Be aware that actions from the WS-I category cannot be combined with other types of actions. Also be aware that when you add a WS-I action to the action list, CentraSite will automatically add dependent actions to the list as necessary.

Modifying the Action List

Use the following procedure to modify the action list for a virtualized API.

To modify the action list for a virtualized API

1. Display the details page for the native API.
2. In the actions bar for the API, click **Virtualize**  .
3. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, do the following:
 - a. In the **Reconfigure an existing virtual alias** section, select the virtual API whose action details you want to modify.
 - b. In the **Endpoint to be virtualized** section, select the endpoint of the virtual API.
 - c. Click **Next**.
This opens the **Virtualize <API_Name> (Step 2 of 3)** wizard to display the list of actions that are assigned to the virtual API.
4. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, to add an action to the **Message Flow** area, proceed as follows:
 - a. In the **Policy Actions** area, expand the desired accordion (Request Handling, Policy Enforcement, Response Handling or Error Handling).
 - b. Locate the action you want to add for the virtualized API.
 - c. Drag and drop the action in the appropriate stage (Receive, Enforce, Routing, or Response) in **Message Flow** area.
 - d. Repeat the above steps for each action that you want to add.
5. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, to configure the parameter values for any new actions that you might have added to the policy action list, or to make any necessary updates to the existing action parameter values, follow the instructions as given below in "[Configuring Policy Action Parameters](#)" on page 200.

6. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, to remove an existing action from the **Message Flow** area, proceed as follows:
 - a. Mouse hover the action you want to remove. This causes an icon to appear, that you can use for removing.
 - b. Click the icon to remove the action
 - c. Repeat the above steps for each action that you want to remove.
7. When the action list is complete and you have configured all of the input parameters for the actions correctly, click the **Virtualize** button to save the changes.

Configuring Policy Action Parameters

Policy actions have parameters that you must set to configure the behavior of the action at enforcement time.

To configure the action parameters

1. Display the details page for the native API. If you need procedures for this step, see *Working with the CentraSite Business UI*.
2. In the actions bar for the API, click **Virtualize** .
3. Navigate to the **Virtualize <API_Name> (Step 2 of 3)** wizard to display the list of actions assigned to the virtual API.
4. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, to configure the required parameters for the policy actions displayed in the **Message Flow** area, proceed as follows:
 - a. Mouse hover the action whose parameters you want to modify.
 - b. Choose the **Configure** icon to the right of the action name.
 - c. In the **<action_name>** dialog box, set the values for the parameters as necessary.
 - d. Click **OK** to save the parameter settings.

Note: If you fail to specify the required parameters, the system alerts you with a red error icon. Pointing to the error icon shows a hint with the error description.

- e. Repeat the above steps for each action that you want to modify.
5. When you have configured all of the required parameters for the virtualized API, click the **Virtualize** button to save the changes.

Publishing and Unpublishing APIs to and from Gateways

API management solution allows you to publish and unpublish APIs to and from webMethods Mediator and webMethods API-Portal gateways.

The Process of Publishing an API to Mediator

Publishing an API to Mediator gateway refers to the process you use to deploy virtualized APIs to Mediator where they are exposed to consuming clients.

The process of publishing an API to the Mediator gateway is carried out by a synchronous mechanism between CentraSite and Mediator.

Doing this involves the following high-level steps:

- **Step 1:** A user initiates the publish process by selecting the virtualized APIs that are to be published, and specifies in which Mediators they are to be published.
- **Step 2:** CentraSite publishes the virtualized APIs to each of the specified Mediators.
- **Step 3:** The publishing process continues even if CentraSite encounters a failure with one of the Mediator.
- **Step 4:** CentraSite logs information about the APIs that fail at the end of the publish process. If the process of publishing returned specific data about the API, the API's metadata is updated as needed in the CentraSite registry/repository.

The Process of Publishing an API to API-Portal

Publishing an API to API-Portal gateway refers to the process you use to deploy native and virtualized APIs to API-Portal on which they are to be exposed for testing and user consumption.

The process of publishing an API to the API-Portal gateway is initiated from CentraSite and is carried out on the API-Portal server.

Doing this involves the following high-level steps:

- **Step 1:** A user initiates the publish process by selecting the virtualized APIs that are to be published, and specifies in which API-Portals they are to be published.
- **Step 2:** CentraSite publishes the virtualized APIs to each of the specified API-Portals.
- **Step 3:** The publishing process continues even if CentraSite encounters a failure with one of the API-Portal.
- **Step 4:** CentraSite logs information about the APIs that fail at the end of the publish process. If the process of publishing returned specific data about the API, the API's metadata is updated as needed in the API-Portal registry.

Roles and Permissions Needed to Publish an API

To publish APIs from CentraSite to the Mediator gateway, you must have the CentraSite Administrator role, or Mediator Publisher role, or the Modify instance-level permission on Mediator itself.

To publish APIs from CentraSite to the API-Portal gateway, you must have the CentraSite Administrator role, or API-Portal Publisher role, or the Modify instance-level permission on API-Portal itself.

If you have the CentraSite Administrator role, you can publish APIs to any gateways that belong to any organization. If you have the Mediator Publisher role or API-Portal Publisher role for a specific organization, you have the ability to publish APIs to the corresponding Mediator or API-Portal gateways that belong to that organization.

For more information about roles and permissions, see *Getting Started with CentraSite*.

Important Considerations When Publishing an API

Following are some things you should consider when you publish an API to the gateways.

- You will only be able to publish APIs to the gateways for which you have the required roles or the Modify instance-level permission.
- You can publish a native API to an instance of API-Portal. However, you cannot publish a native API to an instance of Mediator.
- You can publish virtualized APIs to both Mediator and API-Portal gateways.
- When publishing a virtualized API to both Mediator and API-Portal gateways in a single step, only if publishing to at least one Mediator instance was successful, CentraSite will publish the API to API-Portal instance.
- When publishing an API to one or more gateways, if CentraSite encounters a publish failure with one of the gateway, it immediately ignores the failure gateway and proceeds with the next gateway. Any gateway that encountered failure during the publish process is displayed in the Publish Log.
- When trying to publish an API to a set of gateways, if the API is already published to a selected gateway, then that API is republished to that particular gateway.

Use Cases for Publishing an API

When publishing an API to the Mediator and API-Portal gateways, consider the following use cases:

Use Case A: Publish an API From the Native API Details Page

In this use case, you use the details page of a native API for publishing to the Mediator and API-Portal gateways.

Publish an API Without a Virtualized API

Here, you publish an instance of native API (which does not currently have a virtualized instance) from its details page.

The following table summarizes how an instance of native service A (without a virtualized service A1) is applicable for publishing to both gateways in a single step.

In this use case, there is one principal scenario:

Scenario	Instance of API	Publish to...	
		Mediator	API-Portal
Native Service A without Virtualized Service A1	Native Service		✓

Publish an API With a Virtualized API

Here, you publish an instance of virtualized API (derived from the virtualization action of native API) from the details page of native API.

The following table summarizes how an instance of native service A (with a virtualized service A1) is applicable for publishing to both gateways in a single step.

In this use case, there is one principal scenario:

Scenario	Instances of API	Publish to...	
		Mediator	API-Portal
Native Service A with Virtualized Service A1	Native Service A Virtualized Service A1	✓	✓*

* Only if publishing of an API to at least one Mediator gateway has executed successfully.

For instructions on how to publish an API from the details page of a native API, see the section "[Publishing an Individual API from the Native API Details Page](#)" on page 207.

Use Case B: Publish an API From the Virtualized API Details Page

In this use case, you use the details page of a virtualized API for publishing to the Mediator and API-Portal gateways.

The following table summarizes how an instance of virtualized service B is applicable for publishing to both gateways in a single step.

In this use case, there is one principal scenario:

Scenario	Instance of API	Publish to...	
		Mediator	API-Portal
Virtualized Service B)	Virtualized Service B	✓	✓*

* Only if publishing of an API to at least one Mediator gateway has executed successfully.

For instructions on how to publish an API from the details page of a virtualized API, see the section "[Publishing an Individual API from the Virtualized API Details Page](#)" on page 210.

Use Case C: Publish an API from the Search Results Page

In this use case, you use the Search Results page to publish a set of native and virtualized APIs to the Mediator and API-Portal gateways.

The following table summarizes how a combination of the instances of native service A (with a virtualized service A1), and a virtualized service B are applicable for publishing to both gateways in a single step.

In this use case, there are six principal scenarios:

Scenario 1

Scenarios	Instances of API	Publish/Unpublish	
		Mediator	API-Portal
Native Service A	Native Service A		✓
<i>Without</i>			
Virtualized Service A1			
Virtualized Service B (not published to Mediator)	Virtualized Service B	✓	✓*

Scenario 2

Scenarios	Instances of API	Publish/Unpublish	
		Mediator	API-Portal
Native Service A <i>Without</i>	Native Service A		✓
Virtualized Service A1			
Virtualized Service B (already published to Mediator)	Virtualized Service B	✓	✓*

Scenario 3

Scenarios	Instances of API	Publish/Unpublish	
		Mediator	API-Portal
Native Service A <i>With</i>	Native Service A		
Virtualized Service A1 (not published to Mediator)	Virtualized Service A1	✓	✓*
Virtualized Service B (not published to Mediator)	Virtualized Service B	✓	✓*

Scenario 4

Scenarios	Instances of API	Publish/Unpublish	
		Mediator	API-Portal
Native Service A	Native Service A		
<i>With</i>			
Virtualized Service A1 (not published to Mediator)	Virtualized Service A1	✓	✓*
Virtualized Service B (already published to Mediator)	Virtualized Service B	✓	✓*

Scenario 5

Scenarios	Instances of API	Publish/Unpublish	
		Mediator	API-Portal
Native Service A	Native Service A		
<i>With</i>			
Virtualized Service A1 (already published to Mediator)	Virtualized Service A1	✓	✓*
Virtualized Service B (not published to Mediator)	Virtualized Service B	✓	✓*

Scenario 6

Scenarios	Instances of API	Publish/Unpublish	
		Mediator	API-Portal
Native Service A	Native Service A		
<i>With</i>			
Virtualized Service A1 (already published to Mediator)	Virtualized Service A1	✓	✓*
Virtualized Service B (already published to Mediator)	Virtualized Service B	✓	✓*

* Only if publishing of an API to at least one Mediator gateway has executed successfully.

For instructions on how to publish a set of APIs from the Search Results page, see the section "[Publishing Multiple APIs from the Search Results Page](#)" on page 210.

Publishing API(s) to Gateway(s)

The following procedures describe how to publish a single API or a set of APIs to the gateways.

Publishing an Individual API from the Native API Details Page

When you execute a publish action from the native API details page, the exact rendering of user interface depends on whether or not the native API has an immediate virtualized API.

- If the native API does not have an immediate virtualized API, you will be allowed to directly publish the native API to API-Portal gateway.
- If the native API has an immediate virtualized API, you will be directed to choose the virtualized APIs, and then publish them to both gateways.

Perform these steps to publish an individual API from the details page of a native API.

To publish a single API using details page of native API

1. In CentraSite Business UI, display a list of available APIs.

2. In the displayed list, click the name of the native API.
3. In the action bar of the native API, click **Publish**.
4. If the displayed native API does not have an immediate virtualized API, CentraSite directs you to the **Publish to Gateway** dialog box.
5. Moreover, if the displayed native API has a virtualized API, you will have an intermediate **Publish Virtual APIs** dialog box. This dialog box allows you to configure the virtualized API for publishing to the gateways.

The **Publish Virtual APIs** dialog box lists the names of all of its virtualized APIs.

- a. Mark the checkbox of each virtualized API you want to publish to the gateways.
 - b. Click **Next**. This opens the **Publish to Gateway** dialog box.
6. In the **Gateway** drop-down box, choose the gateway to that you want to publish the API.

The gateways displayed in the drop-down box are the gateways for that you have the Modify permission.

The gateways list includes the following:

If you choose...	CentraSite will display...
Mediator	Instances of the Mediator gateway.
API-Portal	Instances of the API-Portal gateway.
All Gateways	All instances of both the Mediator and API-Portal gateways

By default, the **Gateway** drop-down box is set to **All Gateways**.

7. If you want to further restrict the list of gateways, you can filter the gateways based on the sandbox by which they were classified.

When you filter gateways using a sandbox, CentraSite displays gateways whose endpoints are classified by the specified sandbox. For example, you could use a **Production** sandbox to filter the gateways whose endpoints were classified using the **Production** sandbox.

In the **Sandbox** drop-down box, choose the category by which the gateways were classified.

Note that apart from the predefined categories, you can also use your custom categories to filter the gateways. The predefined categories include:

If you choose...	CentraSite will display...
Development	Instances of a specified gateway whose endpoints were classified by the Development category.
Production	Instances of a specified gateway whose endpoints were classified by the Production category.
Test	Instances of a specified gateway whose endpoints were classified by the Test category.
All Sandboxes	Instances of a specified gateway whose endpoints were classified by any of the above mentioned categories.

By default, the **Sandbox** drop-down box is set to **All Sandboxes**.

8. The gateways list provides the following information about each gateway:

Column	Description
Name	The name assigned to the gateway.
Type	The type of gateway.
Sandbox	The category that classifies deployment endpoint of the gateway.
Settings	<p>The Configure icon displays the API-Portal Settings dialog box that enables you to configure a set of sandbox categories for the specified API-Portal individually.</p> <p>The dialog box also lists the set of API communities available for the specified API-Portal. You can assign an API to one or more API communities.</p>

9. Mark the checkbox of each gateway to which you want to publish the API.
10. *Optional. Applicable for an API-Portal.* Select the sandbox category that classifies the endpoint of the API for publishing to API-Portal, and assign the API to one or more communities available for the specified API-Portal. Do the following:

- a. Click the **Configure** icon next to **Sandbox** field.

This icon displays the **API-Portal Settings** dialog box.

- b. Select the sandbox categories.
- c. Select one or more communities from the list. By default, the API is assigned to the Public Community. Any new communities assigned will overwrite the existing assignments.
- d. Click **OK**.

For more information on API communities, see *webMethods API-Portal Administrator's Guide*.

11. *Optional. Applicable for a Mediator.* Enable the **Expose to Consumers** option to allow guest users to simply access and examine the usage of API through CentraSite.
12. When you have finished making your settings, click **Publish**.
13. A **Publish Inprogress** popup will display the progress state of publishing the API to selected gateways.
If the publish process logs failures, identify and correct the failure and then try publishing the API again.

Publishing an Individual API from the Virtualized API Details Page

When you execute a publish action from the virtualized API details page, you will be allowed to directly publish the virtualized API to both gateways

Perform these steps to publish an individual API from the details page of a virtualized API.

To publish a single API using details page of virtualized API

1. In CentraSite Business UI, display a list of available APIs.
2. In the displayed list, click the name of the virtualized API you want to publish to the gateways.
3. In the action bar of the virtualized API, click **Publish**. This opens the **Publish to Gateway** dialog box.
4. Repeat steps 6 through 13 as above for publishing the virtualized API to gateways as you need.

Publishing Multiple APIs from the Search Results Page

When you execute a publish action from the Search Results page, you will be allowed to directly publish multiple instances of native and virtualized APIs to both gateways in a single step.

Perform these steps to publish multiple APIs from the Search Results page.

To publish a set of APIs using Search Results page

1. In CentraSite Business UI, display a list of available APIs.
2. In the displayed list, mark the checkbox of each API you want to publish to the gateways.
3. In the action bar of the Search Result page, click **Publish**. This opens the **Publish to Gateway** dialog box.
4. Repeat steps 6 through 13 as above for publishing APIs to gateways as you need.

Unpublishing API(s) from Gateway(s)

The following procedures describe how to unpublish a single API or a set of APIs from both gateways.

Unpublishing an Individual API from the Native API Details Page

When you execute an unpublish action from the native API details page, the exact rendering of user interface depends on whether or not the native API has an immediate virtualized API.

- If the native API does not have an immediate virtualized API, you will be allowed to directly unpublish the native API from API-Portal gateway.
- If the native API has an immediate virtualized API, you will be directed to choose the virtualized APIs, and then unpublish them from both gateways.

Perform these steps to unpublish an API from the details page of a native API.

To unpublish a single API using details page of native API

1. In CentraSite Business UI, display a list of available APIs.
2. In the displayed list, click the name of the native API you want to unpublish from the gateways.
3. In the action bar of the native API, click **Unpublish**.
4. If the displayed native API does not have an immediate virtualized API, CentraSite directs you to the **Unpublish from Gateway** dialog box.
5. On the other hand, if the displayed native API has an immediate virtualized API, CentraSite directs you to an intermediate **Unpublish Virtual APIs** dialog box. This dialog box allows you to configure the virtualized API for unpublishing from the gateways.

The **Unpublish Virtual APIs** dialog box lists the names of its virtualized APIs which are already published to the gateways.

- a. Mark the checkbox of each virtualized API you want to unpublish from the gateways.

- b. Click **Next**. This opens the **Unpublish from Gateway** dialog box.
6. In the **Gateway** drop-down box, choose the gateway from that you want to unpublish the API.
7. If you want to further restrict the list of gateways, in the **Sandbox** drop-down box, choose the category by which the gateways were classified.
8. Mark the checkbox of each gateway from that you want to unpublish the API.
9. *Optional. Applicable for a Mediator.* Select the **Revoke Consumability** option to revoke access of API from guest users.
10. When you have finished making your settings, click **Unpublish**.
11. An **Unpublish Inprogress** popup will display the progress state of unpublishing the API from selected gateways.

If the unpublish process logs failures, identify and correct the failure, and then try unpublishing the API again.

Unpublishing an Individual API from the Virtualized API Details Page

When you execute an unpublish action from the virtualized API details page, you will be allowed to directly unpublish the virtualized API from both gateways

To unpublish a single API using details page of virtualized API

1. In CentraSite Business UI, display a list of available APIs.
2. In the displayed list, click the name of the virtualized API you want to publish from the gateways.
3. In the action bar of the virtualized API, click **Unpublish**. This opens the **Unpublish from Gateway** dialog box.
4. Repeat steps 6 through 11 as above for unpublishing the virtualized API from gateways as you need.

Unpublishing Multiple APIs from the Search Results Page

When you execute an unpublish action from the Search Results page, you will be allowed to directly unpublish multiple instances of native and virtualized APIs from both gateways in a single step.

To unpublish a set of APIs using Search Results page

1. In CentraSite Business UI, display a list of available APIs.
2. In the displayed list, mark the checkbox of each API you want to unpublish from the gateways.
3. In the action bar of the Search Result page, click **Unpublish**. This opens the **Unpublish from Gateway** dialog box.

4. Repeat steps 6 through 11 as above for unpublishing APIs from gateways as you need.

Displaying Runtime Information for a Virtual API

You can view the events and metrics for a virtual API in its **Runtime Metrics** profile and **Runtime Events** profile.

To view the runtime information for an API, you must have View permission on the **Runtime Metrics** profile and **Runtime Events** profile of that particular API.

The following sections describe how to view the runtime information of an API.

The Runtime Metrics

You view the following types of Key Performance Indicator (KPI) metrics that webMethods Mediator creates in the **Runtime Metrics** profile of each API.

Metric	Description
Availability	The percentage of time that a service was available during the current interval. A value of 100 indicates that the API was always available. If invocations fail due to policy violations, this parameter could still be as high as 100.
Success Count	The number of successful service invocations in the current interval.
Total Request Count	The total number of requests (successful and unsuccessful) in the current interval.
Fault Count	The number of failed invocations in the current interval.
Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. This is measured from the moment Mediator receives the request until the moment it returns the response to the caller.
Minimum Response Time	The minimum amount of time it took the service to complete an invocation in the current interval.

Metric	Description
Maximum Response Time	The maximum amount of time it took the service to complete an invocation in the current interval.
Note:	<p>By default, the Response Time metrics do not include metrics for failed invocations. To include metrics for failed invocations, set the <code>pg.PgMetricsFormatter.includeFaults</code> parameter to true.</p> <p>For more information about KPI metrics, and intervals, and advanced settings, see <i>Administering webMethods Mediator</i>.</p>

Displaying the Runtime Metrics

Use the following procedure to display runtime metrics for a virtualized asset.

Prerequisite:

You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.

To view the runtime metrics, the following prerequisites must be met:

- To view the runtime metrics of an API, it is necessary that the virtual type's definition includes the **Runtime Metrics** profile.
- If you do not see the **Runtime Metrics** profile of an API, it is probably because you do not have “View” permission for the profile.

To display runtime metrics for an asset

1. Display the details page for the asset whose runtime metrics you want to view.
2. Select the **Runtime Metrics** profile.
3. Expand the **Filters** node.
4. Use the following fields to filter the metrics list you want to view:

In this field...	Specify...
Gateway	<p>A gateway to which the asset is deployed, or select All to view the metrics of all gateways to which the virtual service is deployed.</p> <p>CentraSite displays None by default.</p>
Date Range	<p>A range of dates from which to view the metrics (e.g., Last 1 hour, Last 12 hours, Last 1 day, Last 5 days, Last 10 days, Last 20 days, Custom, etc.).</p>

In this field...	Specify...
	CentraSite displays Last 10 days by default.
Start Date/End Date	If chosen Custom in the previous field, then the time period for which to view the metrics. Start Date: Click the calendar and select a starting date and time. End Date: Click the calendar and select an ending date and time.
Display Interval	A running count metrics of the service displayed at regular time intervals. The interval is specified in the format 3m 2d 6h; wherein m indicates the month, d indicates the day and h indicates the hour.

5. Click **Refine**.

CentraSite displays a graphical view of the metrics for all performance categories as shown below:

- **Multi-line Chart.** The chart shows the Minimum Response Time, Maximum Response Time and Average Response Time of the API.
- **Pie Chart.** The chart shows the Success Request Counts, Total Request Counts and Fault Counts of the API.
- **Gauge Chart.** The chart shows the availability of the API.

The Runtime Events

CentraSite can receive the following predefined runtime event types.

To view the runtime metrics, the following prerequisites must be met:

- You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.
- You must configure CentraSite to receive run-time events from Mediator, as described in "[Run-Time Gateways](#)" on page 21.

Event Type	Description
Lifecycle	A Lifecycle event occurs each time Mediator is started or shut down.

Event Type	Description
Error	An Error event occurs each time an invocation of an API results in an error.
Policy Violation	A Policy Violation event occurs each time an invocation of an API violates a run-time policy that was set for the API.
Transaction	A Transaction event occurs each time an API is invoked (successfully or unsuccessfully).
Monitoring	Mediator publishes key performance indicator (KPI) metrics, such as the average response time, fault count, and availability of all APIs (described below).
Note:	Keep the following in mind: <ul style="list-style-type: none"> ■ For more information about runtime event types, see <i>Administering webMethods Mediator</i>. ■ For details about intervals, see <i>Administering webMethods Mediator</i>.

Displaying the Runtime Events

Use the following procedure to display runtime events for a virtualized asset.

To view the runtime events, the following prerequisites must be met:

- To view the runtime events of an API, it is necessary that the virtual type's definition includes the **Runtime Events** profile.
- If you do not see the **Runtime Events** profile of an API, it is probably because you do not have "View" permission for the profile.

To display event information for an asset

1. Display the details page for the asset whose runtime events you want to view.
2. Select the **Runtime Events** profile.
3. Use the following fields to filter the event list you want to view:

In this field...	Specify...
Gateway	A gateway to which the asset is deployed, or select All to view the event information of all gateways to which the API is deployed. CentraSite displays None by default.

In this field...	Specify...
Consumer	<p>A consumer of the asset, or select All to view the runtime event information of all consumers of the asset.</p> <p>CentraSite displays All by default. However, if you do not have at least one consumer registered in the registry, CentraSite displays None by default.</p>
Event Type	<p>A particular event type, or select All to view all event types.</p> <p>For a list of the supported event types, see "The Runtime Events" on page 215.</p> <p>CentraSite displays All by default.</p>
Date Range	<p>A range of dates from which to view the events (e.g., Last 1 hour, Last 12 hours, Last 1 day, Last 5 days, Last 10 days, Last 20 days, Last 1 month, Custom, etc.).</p> <p>CentraSite displays Last 1 month by default.</p>
Start Date/End Date	<p>If chosen Custom in the previous field, then the time period for which to view the metrics.</p> <p>Start Date: Click the calendar and select a starting date and time.</p> <p>End Date: Click the calendar and select a ending date and time.</p>
Display Interval	<p>A running count events of the service displayed at regular time intervals.</p> <p>The interval is specified in the format 3m 2d 6h; wherein m indicates the month, d indicates the day and h indicates the hour.</p>

4. Click **Refine**.
5. Expand the **Graphical** node to display a graphical view of the event information.
6. Expand the **Tabular** node.

CentraSite displays a tabular view of the event information in the left pane.

Field	Description
Date/Time	The date/time that the event occurred. Click this hyperlinked value to view the Event Detail page, which will contain the event's SOAP request or response name in the Attribute column. Click the

Field	Description
	hyperlinked request or response name to display the full SOAP request or response.
Event Type	(Read-only.) The type of event (e.g., Monitoring, Policy Violation, Error, etc.).
Gateway	(Read only.) The gateway on which the event occurred.

- To access the details of an event, click on the link for the event.

The **Event Details** dialog in the right pane shows a detailed information about the event that you select in the left pane.

Deleting Virtual APIs from the Command Line

Use the toolbox command, `CentraSiteDeleteAsset`, to delete virtual APIs, and revoke any improperly defined associations with other registry objects.

The syntax for the toolbox command is:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteToolbox.cmd |
sh CentraSiteDeleteAsset.jar <arg1_CentraSite_DB_URL>
<arg2_Administrator_User> <arg3_Administrator_User_Password>
<arg4_UUID_of_asset_to_be_deleted>
```

The input parameters are:

Parameter	Description
<code><arg1_CentraSite_DB_URL></code>	(Optional). The fully qualified URL of the CentraSite registry/repository. Default value is <code>http://localhost:53307</code> .
<code><arg2_Administrator_User></code>	The user ID of a registered CentraSite user who has the CentraSite Administrator role. For example, Administrator.
<code><arg3_Administrator_User_Password></code>	The password for the CentraSite user identified by the parameter <code><arg2_Administrator_User></code> .
<code><arg4_UUID_of_asset_to_be_deleted></code>	The ID of the asset you want to delete. You can specify the UDDI key of the asset using an optional prefix "uddi:".

Example:

```
C:\SoftwareAG\CentraSite\utilities>CentraSiteToolbox.cmd
CentraSiteDeleteAsset.jar http://localhost:53305/CentraSite/CentraSite
DOMAIN\admin pAsSw0rD "uddi:3fb8dbd0-6122-11e5-933f-e8830d260cc1"
```

Managing Consumer Applications

A consumer application is a computer application that consumes (invokes) APIs (services, XML services or REST services) at run-time. Typically, consumer applications specify the consumers that are allowed (registered) to consume a particular API. Then, you include the consumer application in the **Consumer** action of the API.

A consumer application in CentraSite is represented by an *Application* asset. The Application asset defines the precise consumer identifiers (for example, a list of user names in HTTP headers, a range of IP addresses, etc.). Thus the policy enforcement point (such as webMethods Mediator) can identify or authenticate the consumers that are requesting an API.

You can use Application assets with any supported policy enforcement point (that is, Mediator or any supported third-party policy enforcement point).

Note: If you want to authenticate consumers (using LDAP or another external authentication mechanism), make sure that your policy enforcement point is configured to enable authentication. For information, see the documentation for your policy enforcement point.

Who Can Create and Manage Consumer Applications?

To create and manage consumer applications, you must belong to a role with the following permissions:

- Create Assets —OR— Manage Assets
- Manage Lifecycle Models (required to change state of consumer applications)

For more information about roles and permissions, see *Getting Started with CentraSite*.

Identifying and Authenticating Consumer Applications

To identify and authenticate consumer applications, you perform the following high-level steps:

1. **Include the Evaluate (consumer) action in the API's Message Flow.**

To identify and authenticate the consumer applications that are requesting a virtual API, that API must have a run-time policy that includes one of the Evaluate action. In an Evaluate action, you specify the consumer identifier you want to use for identifying and authenticating consumer applications. This action extracts the

specified identifier from an incoming request and locates the consumer application defined by that identifier.

For example, if you configure the Evaluate IP Address action to identify and authenticate consumers, the PEP extracts the IP address from a request's HTTP header at run time and searches its list of application assets for the application that is defined by that IP address.

You can configure an "Evaluate" action to identify consumer applications based on the appropriate consumer identifier in a request message:

Action Name	Consumer Identifier	Description
Evaluate IP Address	IP Address	The IP address from which the request originated.
Evaluate Hostname	Host Name	The name of the host machine from which the request originated.
Evaluate HTTP Basic Authentication	HTTP Authentication Token	The user ID submitted by the requestor when it was asked to provide basic HTTP credentials (user name and password).
Evaluate WSS Username Token	WS-Security Authentication Token	The WSS username token supplied in the header of the SOAP or XML request that the consumer application submitted to the virtual API.
Evaluate XPath Expression	Custom Identification	A string produced by applying a specified XPath expression to the SOAP or XML request that the consumer application submitted to the virtual API.
Evaluate WSS X.509 Certificate	Consumer Certification	The X.509 certificate supplied in the header of the SOAP or XML request that the consumer application submitted to the asset.
Evaluate Client Certificate for SSL Connectivity	Client Certificate for SSL Connectivity	The client's certificate that the consumer application submits to the asset. The certificate is supplied during the SSL handshake over the Transport layer. Communication between the client and the asset must be over HTTPS.

When deciding which “Evaluate” action to use to identify and authenticate a consumer application, consider the following points:

- Whatever identifier you choose to identify a consumer application, it must be unique to the application. Identifiers that represent user names are often not suitable because the identified users might submit requests for multiple applications.
- Identifying applications by IP address or host name is often a suitable choice, however, it does create a dependency on the network infrastructure. If a consumer application moves to a new machine, or its IP address changes, you must update the identifiers in the application asset.
- Using X.509 certificates or a custom token that is extracted from the SOAP or XML message itself (using an XPATH expression), is often the most trouble-free way to identify a consumer application.

For more information about the "Evaluate" actions, see ["Usage Cases for Identifying/ Authenticating Consumers" on page 341](#).

2. Create an application asset in the registry.

In the application asset you specify precise values for the consumer identifier(s) that you specified in the "Evaluate" action. For details, see [Creating a Consumer Application](#).

3. Specify the application asset in the Consume action of the API to be consumed.

The Consume action is located in the API's detail page.

The run-time behavior of identifying and authenticating consumers is as follows:

1. CentraSite translates the application asset to the appropriate WS-Security policy assertions or an equivalent XML when the application asset is enforced by the PEP.
2. When a consumer application requests access to an asset, the PEP tries to map the consumer's identifier (which is found in the request) to an identifier in the application asset.
 - If the identifier is an IP address, a host name, a custom identification string or a consumer certificate, the PEP tries to identify the consumer (the consumer is not authenticated).
 - If the identifier is an HTTP Authentication token or a WS-Security Authentication token, the PEP tries to *authenticate* the consumer. If you use webMethods Mediator, authentication is handled by LDAP or by another external authentication mechanism, depending on how Mediator is configured. If you use a third-party PEP, authentication capabilities depend on the PEP.
3. The identified or authenticated consumer information is published back to the registry as part of the transaction or other events. This information is used to correlate the consumer-specific run-time dependencies.

Creating a Consumer Application

Use the following procedure to create a consumer application asset.

To add an asset to the catalog

1. In the activity bar, click **Create Assets**. This opens the **Create Asset** wizard.
2. In the **Basic Information** section, enter values for the following fields:

In this field...	Specify...
Name	A name for the application asset. An asset name can contain any character (including spaces).
Type	The Application asset type.
Organization	The organization to which the application asset belongs.
Initial Version	<p><i>Optional.</i> An identifier for the initial version of the application asset. The default is 1.0, but you can use any versioning scheme you choose. The version identifier does not need to be numeric. Examples:</p> <pre>0.0a 1.0.0 (beta) Pre-release 001 v1-2007.04.30</pre> <p>You can later create new versions of the application asset (see the <i>CentraSite User's Guide</i>).</p>
Description	<i>Optional.</i> A comment or descriptive information about the new application asset.

3. Click **Next**.

Note: If you do not enter information into a required field, a red error icon will be issued. Pointing to the icon shows a hint with an error description.

4. In the **Preview** section, review the information, and click **Finish**.
5. Configure the profiles of the detail page, as described in the following sub-sections.
6. If you belong to a role that has the Register as Consumer permission, the entry **Register as Consumer** is enabled in the actions bar of the details page. If you select this menu entry, a dialog opens that lets you select users, groups and consumer applications that can use this asset. The request must be subsequently approved or rejected by the owner of the asset.

7. Specify the application asset in the **Consume** action of the API to be consumed. To do this, open the detail page of the API to be consumed and specify the application asset in the **Consume** action.

Editing a Consumer Application

Use the following procedure to edit the attributes associated with a consumer application asset in the Business UI.

When editing attributes, keep the following general points in mind:

- If you are not the owner of the asset, you cannot edit the asset unless you have Modify permission on the asset (granted through either a role-based permission or an instance-level permission).
- When you view the details for the asset, you will only see profiles for which you have View permission. You will only be able to edit the profiles on which you have Modify permission.

To edit the attributes for a consumer application asset

1. Display the details page for the application asset.
2. In the actions bar for the asset, select the **Edit**  icon.
3. To edit the application asset's **Name**, **Description** or user-defined version number, place the cursor in the appropriate field and modify the text as required.
4. To modify the extended attributes associated with the asset, do the following:
 - a. Select the profile that contains the attribute(s) that you want to modify.
 - b. Edit the attributes on the profile as necessary.
5. When you have finished making your edits, select the **Save**  icon.

When you are prompted to confirm the save operation, click **Yes**.

- Or: If at any time you want to abandon your unsaved edits, click **Close**. CentraSite will ask you if you want to save your edits. Click **No** to abandon your edits and return the asset's attributes to their previous settings.

Configuring the Consumer Identification Profile

You use the Identification profile to specify the precise values for the consumer identifier(s) that you specified in the "Evaluate" action.

Note: Keep the following in mind:

- If you specify *multiple* identifiers, the system evaluates them with the identifier defined in the "Evaluate" action.

- If you want to authenticate consumers, make sure that your policy enforcement point is configured to enable authentication. For information, see *Administering webMethods Mediator*.

To configure the consumer identifiers

- Specify values for one or more consumer identifier tokens.

Note: The value(s) that you specify in the Identification profile depend on how the run-time policy's "Evaluate" is configured. For example, if `Evaluate IP Address` action is configured to identify and validate consumers by their IP address, you should specify the consumer IP addresses here. For information about this action, see "[Built-In Run-Time Actions Reference for APIs](#)" on page 368.

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In this field...	Do the following...
IPv4 Address	<p>Specify a range of IPv4 addresses. Type the lowest IP address in the From field and the highest IP address in the To field. This will identify only those requests originating from any IP address that lies between the specified range. Example:</p> <pre>192.168.0.0 and 192.168.0.10</pre> <p>If you need to specify additional IP addresses, use the plus button to add more rows.</p>
IPv6 Address	<p>Specify a IPv6 address. This will identify only those requests that originate from the specified IP address. Example:</p> <pre>fdda:5cc1:23:4::1f</pre> <p>If you need to specify additional IP addresses, use the plus button to add more rows.</p>
Hostname	<p>Specify the hostname. This will identify only those requests that originate from the specified hostname. Example:<code>pcmachine.ab.com</code></p> <p>If you need to specify additional hostnames, use the plus button to add more rows.</p>
HTTP Authentication Token	<p>Specify one or more HTTP user names. This will identify only those requests that contain the specified user names</p>

In this field...	Do the following...
	<p>encoded and passed in the HTTP authentication user token. Example: SAGUser123</p> <p>If you need to specify additional tokens, use the plus button to add more rows.</p>
WS-Security Authentication Token	<p>Specify the WSS username token. This will identify only those requests that contain the specified user name passed in the SOAP or XML message header. Example: <code>userwss</code></p> <p>If you need to specify additional tokens, use the plus button to add more rows.</p>
XPath Token	<p>Specify one or more XPath expressions. This will identify only those requests that contain the specified XPath in the SOAP or XML message or request. Example:</p> <pre data-bbox="602 856 1391 961"> //*[local-name()='Envelope']/* [local-name()='Body']/* [local-name()='echoInt']/* [local-name()='echoIntInput='] [.='2'] </pre> <p>If you need to specify additional tokens, use the plus button to add more rows.</p>
Consumer Certificate	<p>Specify the X.509 certificates that help the API owner to identify requests from you.</p> <p>Click Upload to locate and select the certificate (.cer) file.</p>
Partner ID	<p>Specifies the trading partner ID.</p> <p>When a consumer application is identified in Mediator and the event logging is enabled, you can locate the partner ID in the event data of the identified consumer. You can leverage the event data for partner based analytics.</p> <div data-bbox="602 1465 1391 1556" style="border: 1px solid gray; padding: 5px;"> <p>Note: The Partner ID attribute is introduced for integration scenarios based on webMethods Trading Networks.</p> </div>

Publishing a Consumer Application to Mediator Gateway

You can publish consumer application assets to a policy enforcement point (such as webMethods Mediator).

You use this procedure to publish the consumer applications associated with an API using its **Publish** action.

Note that the CentraSite Business UI does not have a dedicated user interface available to publish consumer applications to Mediator. Instead, it deploys the consumer applications that are associated to an API when that particular API is published to the Mediator.

To publish consumer applications

1. Display the details page for the application asset.
2. In the actions bar for the asset, click **Publish** . This opens the **Publish API** dialog.
3. From the **Available Gateways** list, choose one or more gateways in which you want to publish the consumer applications.
 - Or: If you want to publish the consumer applications across all the gateways, select the **All Gateways** checkbox.

When attempting to publish the consumer applications, without selecting at least one gateway, a warning popup box appears.

4. In the **Advanced Settings** node, select the **Expose to Consumers** checkbox. This allows unauthorized consumers (guests) to search and access the consumer applications.
5. Click **Publish**.
 - Or: If at any time you wish to terminate this operation, click **Cancel**.
6. A **Publish Progress** popup will display the progress state of publishing the consumer applications to the Mediator.

If the publish process failed, identify and correct the error and then try publishing the consumer applications again.

Deleting a Consumer Application

Use the following procedure to delete a consumer application asset.

How to Delete a Consumer Application

The following procedure describes how to delete a single application.

To delete a consumer application

1. Display the details page for the application asset that you want to delete.
2. In the actions bar for the asset, select the **Delete**  icon.

When you are prompted to confirm the delete operation, click **OK**.

The application asset is permanently removed from the CentraSite registry/repository.

How to Delete Multiple Consumer Applications in a Single Operation

You can delete multiple application assets in a single step. The rules described above for deleting a single application asset apply also when deleting multiple application assets.

Important: If you have selected several application assets where one or more of them are predefined application assets, you can use the **Delete** button to delete the assets. However, as you are not allowed to delete predefined application assets, only assets you have permission for will be deleted. The same applies to any other application assets for which you do not have the required permission.

To delete multiple application assets in a single operation

1. Display the list of application assets.
2. Mark the checkbox of each application asset you want to delete.
3. In the actions bar of the Search Results page, select the **Delete**  icon.

When you are prompted to confirm the delete operation, click **OK**.

The selected application assets are permanently removed from the CentraSite registry/repository.

Consumer Registration

Clients that need to call (consume) APIs must register with CentraSite as consumers of the API.

The API provider (owner of the API) enforces the type of authentication (API key or OAuth2 token) required for consuming an API. Based on the authentication enforced for the API, an API consumer will request the API key or the OAuth2 token in order to call (consume) that API.

- Clients that want to use the API key to call (consume) an API in CentraSite must:

1. Register as a consumer for the API.

When the client registration request is approved, the client receives an API key (a base64-encoded string of the `consumer-key:consumer-secret` combination). It works for both SOAP and REST calls.

2. To call the API, the client must pass the API key in the HTTP request header or as a query string parameter. The use of this key establishes the client's identity and authentication.

For information about using API keys to consume APIs, see "[Fetching and Using Your API Keys for Consumption](#)" on page 236.

- The type of OAuth2 authorization grant that Mediator supports is "Client Credentials". Client credentials are used as an authorization grant when the client

is requesting access to protected resources based on an authorization previously arranged with the authorization server. That is, the client application gains authorization when it registers with CentraSite as a consumer.

Clients that want to use the OAuth 2.0 protocol to call (consume) APIs in CentraSite must:

1. Register as a consumer for the API.

When the client registration request is approved, the client receives client credentials (a `client_id` and `client_secret`).

2. Pass the client credentials to the Mediator-hosted REST service `mediator.oauth2.getOAuth2AccessToken`.

This service will provide an OAuth2 access token to the client. For information about this service, see ["Fetching and Using Your OAuth2 Access Tokens for Consumption" on page 238](#).

3. To call the API, the client must pass their OAuth access token as an integral part of the HTTP request header.

An OAuth2 token is a unique token that a client uses to invoke APIs using the OAuth 2.0 protocol. The token contains an identifier that uniquely identifies the client. The use of a token establishes the client's identity, and is used for both the authentication and authorization.

Registering a New Consumer

A consumer in CentraSite is represented by an individual user or an Application asset that is already registered to consume an API.

Clients can register as consumers of APIs as a:

- User or user group with a valid CentraSite user account (see ["Authorized CentraSite User Accessing API as Logged-On User" on page 229](#) for details).
- Guest user with or without a valid CentraSite user account (see ["Authorized CentraSite User Accessing API as Guest User" on page 230](#) or ["Unauthorized User Accessing API as Guest User" on page 230](#) for details).
- Consumer application which is represented as an Application asset in the registry (see ["Registering Application Assets as Consumers of an API" on page 231](#) for details).

An Application asset defines precise consumer identifiers (for example, a list of user names in HTTP headers, a range of IP addresses, etc.). Thus Mediator can identify or authenticate the consumers that are requesting an API.

Registering Users as Consumers of an API

Users can register themselves as consumers of specified APIs, using the Consume action. That is, users can request permission to access specified APIs in the registry. The owners

of the APIs may approve or reject such requests. The Consume action applies only to proxy APIs.

Note: To enable CentraSite to issue email messages, an administrator must first configure CentraSite's email server settings. For procedures, see *CentraSite Administrator's Guide*.

To register a user as a consumer for an API

1. Display the details page for the API that you want to consume.
2. In the actions bar for the API, select the **Consume** () icon. This opens the **Consume API** dialog.
3. Depending on the type of user account you have in CentraSite, you must complete one of the following procedures:

["Authorized CentraSite User Accessing API as Logged-On User" on page 229](#)

- OR -

["Authorized CentraSite User Accessing API as Guest User" on page 230](#)

- OR -

["Unauthorized User Accessing API as Guest User" on page 230](#)

Authorized CentraSite User Accessing API as Logged-On User

You must at least have the instance-level View permission for the specified API. If your user account belongs to a role that has either the Manage Assets, Create Assets, Modify Assets or View Assets permission for an organization, you automatically have permission to register as consumer for all APIs in that particular organization.

1. Specify the **API Key** or **OAuth2** client credentials.
2. In the **Consumer Name** field, specify your CentraSite username.
3. Select the **Email me** checkbox in order to receive auto-generated workflow notifications, and then specify your email address.
4. Enter a reason to request the API for consumption.
5. If the API's policy governance rule includes one or more "Evaluate" actions, you will see the **Consumer Identifier** field. Enter your consumer identifier, by which the provider will recognize your messages at run time. For details, see ["Configuring the Consumer Identification Profile" on page 223](#).
6. In the **Reason for Request** field, enter the reason for requesting consumption of the asset.

This field will be visible to all designated approvers who would review the consumer registration request for the asset.

7. Click **Consume**.

A request is sent to the designated approvers. Upon approval, a request for consumption of the selected API will be sent to the provider of the API, who will then generate the API key / OAuth2 client credentials.

Once approved, the API consumption request will be processed and a notification will be sent to you at the specified email address.

If an approval workflow is not defined for the API, the API key / OAuth2 credentials is generated immediately.

To get your generated API keys or OAuth access tokens for consumption, see ["Obtaining Your API Keys and Access Tokens for Consumption" on page 235](#).

Authorized CentraSite User Accessing API as Guest User

1. In the Login page, enter your username and password and click **Next**.
2. Specify the **API Key** or **OAuth2** client credentials.
3. In the **Consumer Name** field, specify your CentraSite username.
4. Select the **Email me** checkbox in order to receive auto-generated workflow notifications, and then specify your email address.
5. Enter a reason to request the API for consumption.
6. If the API's policy governance rule includes one or more "Evaluate" actions, you will see the **Consumer Identifier** field. Enter your consumer identifier, by which the provider will recognize your messages at run time. For details, see ["Configuring the Consumer Identification Profile" on page 223](#).
7. Click **Consume**.

A request is sent to the designated approvers. Upon approval, a request for consumption of the selected API will be sent to the provider of the API, who will then generate the API key / OAuth2 credentials.

Once approved, the API consumption request will be processed and a notification will be sent to you at the specified email address.

If an approval workflow is not defined for the API, the API key / OAuth2 credentials is generated.

To get your generated API keys or OAuth access tokens for consumption, see ["Obtaining Your API Keys and Access Tokens for Consumption" on page 235](#).

Unauthorized User Accessing API as Guest User

If you are a guest user without a valid CentraSite user account, CentraSite internally executes a consumer onboarding workflow. This workflow helps you to onboard in an organization of interest within the CentraSite registry/repository. An onboarding request is sent to the organization's administrator for approval. On successful onboarding of the user, a request for consumption of the selected API will be sent to the provider of the API who will generate the API key or OAuth2 client credentials.

1. In the Request an Account page, specify the following:
 - a. Enter your **First Name** and **Last Name**.
 - b. Type in your password in the **Password** field.
 - c. Retype the password in the **Confirm Password** field.
 - d. Enter the **Email** address which you will use as username when signing into CentraSite Business UI.
 - e. Enter the **Organization** you want to join.

If the **Organization** field is left blank, CentraSite will automatically register the user as a consumer in the organization that was configured in the Global Onboarding Policy.
 - f. Click **Next**.
2. Specify the **API Key** or **OAuth2** client credentials.
3. In the **Consumer Name** field, specify your CentraSite user name.
4. Select the **Email me** checkbox in order to receive auto-generated workflow notifications, and then specify your email address.
5. Enter a reason to request the API for consumption.
6. If the API's policy governance rule includes one or more "Evaluate" actions, you will see the **Consumer Identifier** field. Enter your consumer identifier, by which the provider will recognize your messages at run time. For details, see ["Configuring the Consumer Identification Profile" on page 223](#).
7. Click the **Consume** button.

A consumer registration request is sent to the organization's administrator for approval. Upon successful registration of the consumer, a request for consumption of the selected API will be sent to the provider of the API, who will then generate the API key / OAuth2 credentials.

If an approval workflow is not defined for the API, the API key / OAuth2 credentials is generated immediately.

To get your generated API keys or OAuth access tokens for consumption, see ["Obtaining Your API Keys and Access Tokens for Consumption" on page 235](#).

Registering Application Assets as Consumers of an API

If you have permissions to view an API, and you belong to a role that includes the Register as Consumer permission, the Consume action is enabled in the API details page. This action opens a dialog that lets you request the right to be a consumer of the specified API. You can request the right for any consumer application owned by any organization.

The request must be subsequently approved or rejected by the owner of the API.

To register an application asset as a consumer for an API

1. Display the details page for the API that you want to consume.
2. In the actions bar for the API, select the **Consume**  icon. This opens the **Consume API** dialog.
3. In the **Application** textbox, type the keyword(s) to search for. CentraSite applies the filter to the application asset's name. Choose an application asset from the selection list.
4. If you want to specify additional application assets, use the plus button beside the **Application** field to create a new **Application** input field, and choose another application asset.
5. When you have specified all required applications, click **Consume**. Requests to register the applications are sent to the owner of the specified API.
6. The owner of an API can either accept or decline a register as consumer request as follows:

- Go to the API details page.
- You will see the pending consumer registration requests () for an API in the description area of the **Basic Information** profile, for example, `N consumer registration requests are pending`.

If there are no pending consumer registration requests for the API, this is displayed as 0.

- Click the hyperlinked number `N` to open the **Pending Consumer Registration Requests** dialog. This dialog contains a list of all consumer registration requests that have been submitted for the particular API, including requests that were auto-approved.
- Choose the consumer registration request that you want to review and approve by clicking its hyperlinked name.

The details for the request will appear in the **Consumer Registration Request** dialog.

- In the **Comment** text box, type a comment (e.g., `Request rejected. Add required specifications to this API and resubmit`).
- Click the **Accept** or **Reject** button to approve or reject the request.

After the applications are approved to consume the specified API, CentraSite automatically changes the consumer count in the API's **Basic Information** profile.

For details, see "[Monitoring Consumer Count for an API](#)" on page 233.

Viewing Consumer Registration Requests

To view a summary of all register as consumer requests, go to the API details page:

- If you are the owner of an API, and another user has made a request to register as a consumer of the API, you can view the request here. As the API owner, you can accept or decline the request.
- If you have made a request to register as a consumer of an API owned by another user, you can view the status of the request here.

Note: If an API has a pending state change approval request and a pending consumer registration request, then the pending state change approval takes priority over the pending consumer registration request.

Monitoring Consumer Count for an API

CentraSite Business UI has extensive support for consumer-provider tracking that allows you to monitor the number of consumers for an API.

The number of users who consume an API is displayed in brackets with icons (representing the *Consumers*) in the description area of the **Basic Information** profile in the API details page, for example, (5) Consumers. If no consumers are registered for the API, this is displayed as (0) Consumers.

Clicking on this consumer count displays the consumers' information.

Unregistering an Existing Consumer

You can now unregister a consumer from an API in CentraSite.

You might consider unregistering a consumer if you want to:

- Suspend consumption of a particular API (either on a temporary or permanent basis.)
- Delete a user or consumer application asset permanently from the CentraSite registry.

Note: A user or consumer application can only be deleted if they are not associated with any of the APIs in CentraSite. To determine whether a user or consumer application is associated with an API, click on the **Consumers** link in the **Basic Information** profile of individual APIs in the registry. Verify if the particular user or consumer application is listed in the **Consumers** pop-up menu.

Note: You can restore the functionality of consumption by re-registering the user or consumer application asset with the same API at any time.

The consequences of unregistering a registered consumer on existing API are as follows:

- The count of consumers in the **Basic Information** profile of the API is updated.

- Some aspects of runtime such as invocations, performance metrics and other events relating to the operation of a virtual API running in Mediator may not work as desired.

Prerequisites for Unregistering:

To unregister a consumer from an API, the following prerequisites must be met:

- The user or consumer application asset should be currently registered with the API. For more information, see ["Registering a New Consumer" on page 228](#).
- You have been assigned the View Assets permission for the organization to which the API belongs.
- You have been assigned at least the Modify instance-level permission on the API, or the consumer object (which is represented by an individual user, or group, or an application asset).

Note: This note explains how to permit other users to unregister consumers from an API. CentraSite exposes a web service to allow administrators to manage the unregistration operation. This web service service is invoked by CentraSite any time a consumer triggers the unregistration operation through Business user interface. Initially, only the predefined "Administrator" user serves as the privileged user to invoke the web service. After installation, a user who is defined in CentraSite with the CentraSite Administrator role is assigned to invoke this web service. However, administrators have the flexibility to allow their own users to invoke this service. To add your own user as a privileged user for the unregistration operation, do the following:

To add your own user as a privileged user for the unregistration operation, do the following:

1. Open the centrasite.xml configuration file.

The configuration file is located in the `<CentraSiteInstallDir>\cast\cswebapps\BusinessUI\custom\conf` directory.

2. Go to the section `<Services>` in the configuration file. Add the following property statement:

```
<Service id="ConsumerRegistrationService"
privilegeUser="INTERNAL\Administrator" requiredRoles=" \"</
Service>
```

After making the above change, the `<Services>` section would look like the following:

```
<CLLConfigurations>
<Services>
  <Service id="ConsumerRegistrationService" privilegeUser="INTERNAL\Administrator" r
</Services>
</CLLConfigurations>
```

where,

Property	Description
<code>id</code>	A unique identifier of the privileged web service.
<code>privilegeUser</code>	User who has privilege to access and execute various actions on the API.
<code>requiredRoles</code>	A set of roles required to access and execute the various actions on the virtual API. In this case, the value of <code>requiredRoles</code> parameter should be empty.

3. Save and close the configuration file.
4. Restart Software AG Runtime.

If you want to unregister a consumer from an API, proceed as follows:

To unregister a consumer from an API

1. Display the details page of the API (see ["Viewing or Changing a Virtual API" on page 192](#) for details).

The number of users or application assets who are already registered as consumers for the API is displayed in braces with icons indicating **Consumers** in the description area of the **Basic Information** profile, for example, **(3) Consumers**. If no consumers are registered for the asset, this is displayed as **(0) Consumers**.

2. Click on the link for the **Consumers** count to display the list of registered consumers.
3. Move the mouse over the consumer you want to unregister. This causes a **Delete** icon to appear, that you can use for unregistering.
4. Click the **Delete** icon to unregister the consumer.

Note: If you unregister a consumer application, you must manually republish the API to Mediator to put the changes into effect.

Obtaining Your API Keys and Access Tokens for Consumption

The following section describes how to fetch your API keys and access tokens that enable you to consume APIs.

Note: To enable CentraSite to issue email messages, an administrator must first configure CentraSite's email server settings. For procedures, see the *CentraSite Administrator's Guide*.

Fetching and Using Your API Keys for Consumption

RESTful APIs are often exposed over the open Internet for consumption. API providers need a mechanism to prevent unauthorized access to the API. One approach is to provision consumers with API keys. Those keys can be used as authentication tokens.

CentraSite API Management Solutions automatically generates API keys when consumers request to consume APIs. The API providers can view, approve and set expiration for API keys. This ensures that no consumer can access a protected API without a valid key.

API keys are verified at runtime to ensure that:

- The API key presented is valid and has not expired.
- The API key presented is approved to consume an API that includes the URI in the request.

If you will be using the API key authentication and you have successfully registered as a consumer for an API, you should have received your API key details through an email message.

The API Consumption Model

To enable a consumer to consume an API, the following events must occur:

1. The consumer sends a request to consume a specified API. The request must include the consumer's authentication credentials.
2. CentraSite generates the API key for consumption of the API (the specific key generation steps depend on the configuration settings defined by the Provider of that particular API). Later, CentraSite prepares the API for publishing and invokes the API Key Generation policy on the Mediator. The consumer will use this API key in order to consume this API.
3. The API Key Generation policy publishes the API in the Mediator.
4. If the publication is successful, the API Key Generation policy returns a success message, including data that is pertinent to the published API. (This includes the API key that is required for consuming this API). If the publishing is unsuccessful, the deployer service returns a failure message.
5. The consumer accesses the URL for API consumption, sends the API key as integral part of the HTTP request header or as a query string, and upon validation of the API key consumes the API.
6. If the consumption is successful, the consumer uses the API. If the consumption is unsuccessful for some reasons of authentication, a 500 fault is returned.

How Does Mediator Evaluate Consumers at Run Time?

After you (the API consumer) have successfully registered as a consumer for a particular API, in order to call an API you must pass your API key or OAuth2 access token in your HTTP request header.

- If you use an API key to call the API, the client must pass the API key in the HTTP request header or as a query string parameter. The use of this key establishes the client's identity and authentication.
- If you use an OAuth2 access token to call the API, the client must pass the OAuth2 access token as an integral part of the HTTP request header. An OAuth2 token is a unique token that a client uses to invoke APIs using the OAuth 2.0 protocol. The token contains an identifier that uniquely identifies the client. The use of a token establishes the client's identity, and is used for both the authentication and authorization.

In addition, the API provider can include run-time security actions in the run-time governance rules for APIs. Security actions can validate clients' request and response messages (through WSS X.509 certificates, WSS username tokens etc.) or identify clients (through IP address or hostname). To enforce client validation, Mediator maintains a list of consumer applications specified in CentraSite that are authorized to access the API published to Mediator. For more information about run-time governance rules, see ["Run-Time Governance Reference" on page 313](#).

How Does a Consumer Use the Generated API Key?

REST services rely on HTTP methods like GET, POST, PUT and DELETE to make request to an API provider, so the API keys are closely tied to these HTTP methods, where they are sent as part of these HTTP method requests.

CentraSite allows you to set API keys as part of the HTTP header or as the query component of an API request.

Important: In the case where a consumer is sending a request with both credentials (HTTP header) and (query string), the HTTP header take precedence over the query string when the Mediator is determining which credentials it should use for the consumption.

Request Header

The API keys are passed as the HTTP header component of an API consumption request. The HTTP header corresponds to an array of header names to include for that particular API consumption.

The following example demonstrates a typical HTTP request with API keys that form the header value of the API Access URL.

```
x-CentraSite-APIKey:a4b5d569-2450-11e3-b3fc-b5a70ab4288a
```

Query String

The API keys are passed as the query component of an API consumption request.

The following example demonstrates a typical HTTP GET request with API keys that form a query string of the API Access URL.

```
http://localhost:5555/ws/RestAPI?APIKey=a4b5d569-2450-11e3-b3fc-b5a70ab4288a
```

Notice that the API keys are added to the path after a "?", and specified as key-value pair.

What Happens When You Request for API Consumption?

When you request an API for consumption using the Access URL and the generated API key, CentraSite automatically validates the APIs run-time actions to ensure that any "Evaluate" action that appears in the policy governance rule of an API is validated with the consumer requesting for that API.

What Happens When Consumption Fails?

If the API consumption encounters a problem due to one or more of the following reasons, a 500 SOAP fault is returned.

- If the API key value in the HTTP header or the query string is authenticated as invalid.

The sample message looks like this:

```
The request is authenticated as invalid.
```

- If the HTTP header is not present in the request.

The sample message looks like this:

```
A required header is missing in the request.
```

- If the API key value in the HTTP header is expired.

The sample message looks like this:

```
The API key has expired.
```

Fetching and Using Your OAuth2 Access Tokens for Consumption

If you will be using the OAuth 2.0 protocol and you have successfully registered as a consumer for an API, you should have received your OAuth2 client credentials (a `client_id` and `client_secret`).

Now you need to obtain an OAuth2 access token by passing your client credentials to the Mediator-hosted REST service `mediator.oauth2.getOAuth2AccessToken`. This service will provide an OAuth2 access token that you can subsequently include in your requests to call the API.

The service's input parameters are:

- `client_id`
- `client_secret`
- `scope` (optional). The scope value is the name of the virtual service. If the scope value is valid, Mediator obtains the access token. If no scope value is provided, Mediator provides the access token to the scope in which the client is allowed, and adds the scope to the response. To pass the scope, pass it in the request body.

Ways for Clients to Provide the Inputs

There are three ways in which a client can provide the inputs for this service:

- Provide inputs in the Basic authentication header (recommended).

The client can provide the client credentials (`client_id` and `client_secret`) in the Authorization header using the following form:

```
Authorization: Basic <base-64-encoded client_id:password,
client_secret>
```

If you want to pass the scope, pass it in the request body.

- Provide JSON inputs for the service.

The client can send a JSON request to the service in the following form:

```
{
  "client_id" : "",
  "client_secret": "",
  "scope" : ""
}
```

Note: The client should contain the header `Content-type:application/json` in the request.

- Provide inputs in the request body

The OAuth2 specifications do not support sending the client credentials over the URL as URL-Encoded. However, you can send the client credentials in the request body using the following form:

```
client_id=<client_id>&client_secret=<client_secret>&scope=<scope>
```

Note: The client should contain the header `Content-type:application/x-www-form-urlencoded` in the request.

Note: If a client provides the `client_id` and `client_secret` in both the Authorization header and the request body, the credentials given in the Authorization header are used.

Using HTTPS for Granting Access Tokens

For security reasons it is recommended to use HTTPS in your production environment. If you will be using HTTPS as the transport protocol over which the OAuth2 access

tokens will be granted authorization, you must set the parameters `pg.oauth2.isHTTPS` and `pg.oauth2.ports` as described in *Administering webMethods Mediator*.

Responses Returned to Clients

Following are sample responses that are returned to the client:

- Sample XML response:

```
<Response
xmlns="https://localhost/rest/pub.mediator.oauth2.getOAuth2AccessToken">
<access_token>db95b40095f31439a1cd8f411e64abe8</access_token>
<expires_in>3600</expires_in>
<token_type>Bearer</token_type>
</Response>
```

- Sample JSON response:

```
{
  "access_token": "db95b40095f31439a1cd8f411e64abe8",
  "token_type": "Bearer",
  "expires_in": 3600
}
```

Managing Your API Keys

An API key is a secret code that you can use to identify yourself to CentraSite when you interact with API. You generate an API Key in Mediator by registering as consumer for the API, and then use the key in interactions with the specific API published to Mediator. Multiple interactions may be performed with the same API key.

The following sections describe the various operations you can perform on the API key at the disposal of the API provider (owner of the API).

Operations	For Instructions...
View Details of an API Key	See "Fetching Details of Your API Keys" on page 240.
Renew an API Key	See "Renewing Your API Key" on page 243.
Revoke an API Key	See "Revoking Your API Key" on page 244.
Delete an API Key	See "Deleting Your API Key" on page 244.

Fetching Details of Your API Keys

If you will use the API key authentication and you have successfully registered as a consumer for an API, you should have received your API key details.

The CentraSite Business user interface enables users to view details of an API key in the following ways:

- Through the email notification messages that were auto-generated by CentraSite. For procedures, see "[Viewing Details of an API Key Using the Email Notification](#)" on page 241.
- Through the Consumer Overview profile of an API. For procedures, see "[Viewing Details of an API Key Using the API Details Page](#)" on page 241.
- Through the User Preferences page for a consumer. For procedures, see "[Viewing Details of an API Key Using the User Preferences](#)" on page 242

Viewing Details of an API Key Using the Email Notification

Once your API registration request is approved, CentraSite sends an automated email message containing details of the API key value and its usage to both the approver and consumer.

If you want to receive email messages of the API key, make sure:

- You have the notification option set as **Email** in the User Preferences page.
- You have specified a valid email address.

Access your mailbox.

The information contained in the email message depends on whether you access the API as a consumer or the owner.

- If you were the requestor for the API registration, you will see the following information:
 - API key
 - Key expiration date
 - API key usage
- If you are the owner of the API, you will see the following information:
 - API key
 - Key expiration date

Viewing Details of an API Key Using the API Details Page

You can use the following procedure to view the details of an API key via the API Details page.

To view the details of an API key

1. Display the details page for the API whose key value want to view.
2. Select the **Consumer Overview** profile.

The information contained in this profile depends on whether you access the API as a consumer or the owner.

- If you were the requestor for API registration, you will see the following information:
 - API key
 - Key expiration date
 - API key usage
- If you are the owner of the API, you will see the following information:
 - API key
 - Key expiration date

Viewing Details of an API Key Using the User Preferences

Alternatively, you can use the following procedure to view the details of all your API keys via the User Preferences page.

To view the details of an API key

1. In the navigation bar of the CentraSite Business UI, click on your profile name.
The User Preferences page appears.
2. Select **My Access Keys**. This displays a list of your API keys in CentraSite.

Note: The **My Access Keys** panel IS NOT VISIBLE if at least one API key is not available in your CentraSite registry/repository.

3. Each entry in the API key list contains the following information:
 - API key
 - Key value
 - Key expiration date

Additionally in the User Preferences page, you can do the following operations on an API key:

- Renew  your API key, provided the key has a limited usage period, as described in ["Renewing Your API Key" on page 243](#).
- Revoke  your API key temporarily from the CentraSite registry, as described in ["Revoking Your API Key" on page 244](#).
- Delete  your API key permanently from the CentraSite registry, as described in ["Deleting Your API Key" on page 244](#).

Renewing Your API Key

API keys have an expiration period, which is set by the API provider. After an API key is generated, sometimes the API consumer might have to renew the old key due to expiration or security concerns. The API provider can also change the expiration period for the API key or set it so that the key never expires. For more information about configuring the API consumption settings for API key authentication, see *Working with the CentraSite Business UI*.

To request for renewal of an API key, the following prerequisites must be met:

- API provider must have configured the predefined policy `API Key Renewal`, which enables the CentraSite Administrator, API Provider or designated approvers to approve or reject the "Renew API Key" requests. For more information about API key renewal policy, see *Working with the CentraSite Business UI*.
- A gateway instance (for example, Mediator) should be up and running. For information on gateways, see ["Run-Time Gateways" on page 21](#).
- The consumer must be a registered consumer for the specified API. For more information on registering as consumers for an API, see ["Consumer Registration" on page 227](#).

To renew your API key

1. In the navigation bar of CentraSite Business UI, click on your profile name.
This displays the User Preferences page.
2. Select **My API Keys**. This displays a list of all of your API keys in CentraSite.
3. Move the cursor over the API key that you want to renew.
4. Click the **Renew**  icon.

Important: If the API key has an unlimited expiration period, the **Renew** icon is *NOT* visible in the user interface.

Sometimes you might have to require an approval to renew the API key. If your API has the **Require Approval** configured in the API consumption settings, CentraSite will not renew the API key until the required approvals are obtained. However, if an approval workflow is not configured for the API, the API key is renewed immediately. For more information about approval actions, see *Working with the CentraSite Business UI*.

After renewing the API key, CentraSite automatically publishes the API to the Mediator, triggered by a *Deploy Access Key* action that is included in the API Key Renewal policy. For more information about the usage of this policy, see *Working with the CentraSite Business UI*.

Once the API key renewal request is approved by the designated approvers, CentraSite sends an email message to the API consumer informing the new validity of API key.

Revoking Your API Key

The API consumer might want to revoke an API key if, for example, the key is no longer needed or if an error is found in the API.

To request for revocation of an API key, the following prerequisites must be met:

- API provider must have configured the predefined policy `API Key Revocation`, which enables the CentraSite Administrator, API Provider or designated approvers to approve or reject the "Renew API Key" requests.
- A gateway instance (for example, Mediator) should be up and running. For information on gateways, see ["Run-Time Gateways" on page 21](#).

To revoke your API key

1. Display the User Preferences page.
2. Select **My API Keys**. This displays a list of all of your API keys in CentraSite.
3. Move the cursor over the API key that you want to revoke.
4. Click the **Revoke**  icon.

A confirmation message appears that the API key will be revoked.

Once the API key revocation is processed, CentraSite sends an email message to the API Consumer informing the request has been processed successfully.

Deleting Your API Key

The API key consumer can delete API keys. Deleting an API key permanently removes the key from the CentraSite registry/repository. Deleting an API key will not remove the API that is associated with it.

When you delete an API key, CentraSite removes an entry for the API key (that is, it removes the instance of the API key from CentraSite's object database). Also note that:

- An API key can only be deleted if it is already revoked.
- You cannot delete an API key that is in the "pending" mode (example, awaiting a renew approval).
- You must be a registered consumer for the specified API. For more information on registering as consumers for an API, see [Consumer Registration](#).

You can delete a single API key or a selected set of API keys. The descriptions in this section give you details on how to do this.

Deleting an Individual API key

The following procedure describes how to delete a single API key.

To delete a single API key

1. In CentraSite Business UI, display the details page for the API key that you want to delete.
2. In the actions bar for the API key, select the **Delete** () icon.
3. When you are prompted to confirm the delete operation, click **OK**.

The API key is permanently removed from the CentraSite registry/repository.

Deleting Multiple API Keys in a Single Operation

You can delete multiple API keys in a single step. The rules described above for deleting a single API key apply also when deleting multiple API keys.

To delete a set of API keys in a single step

1. Display the list of API keys.
2. Mark the checkbox next to the name of each API key that you want to delete.
3. In the actions bar of the Search Results page, select the **Delete** () icon.
4. When you are prompted to confirm the delete operation, click **OK**.

Each selected API key is permanently removed from the CentraSite registry/repository.

Note: If one or more of the selected APIs is in pending mode (example, awaiting approval), an error message will appear and no API keys will be deleted.

Privileged User of a Virtual API

A *Privileged User* is a user who has an elevated level of access to perform various actions on a virtual API, such as configuring the API key settings, publishing the virtual API to webMethods Mediator, and so on.

When the user tries to perform a privileged action on the virtual API, CentraSite validates the user's ID to determine whether the user holds the necessary privileges, and if so, it validates whether the privileges are enabled. If the user fails these validation, CentraSite does not perform the action.

A user who belongs to the CentraSite Administrator role defines the privileged user for the virtual API in the custom configuration file (centrasite.xml).

```
<Service id="DeploymentService" privilegeUser="INTERNAL\Administrator"
  requiredRoles="Mediator Publisher"> </Service>
```

wherein,

<u>Input Parameter</u>	<u>Specifies...</u>
id	A unique identifier of the virtual API.
privilegeUser	User who has privilege to access and execute various actions on the virtual API.
requiredRoles	A set of roles required to access and execute the various actions on the virtual API.

By default, an `INTERNAL\Administrator` with Mediator Publisher role is configured as the privileged user for the virtual API.

5 Invoking webMethods IS Services in Virtual Services

■ Introduction	248
■ Using the Security API in webMethods IS Services	249

Introduction

A webMethods Integration Server (IS) service is a user-defined Integration Server flow service that you can invoke in:

- Request Processing steps, to preprocess the request message before it is submitted to the native service.
- Response Processing steps, to preprocess the response message from the native service before it is returned to the consuming application.

A webMethods IS service must be running on the same Integration Server as webMethods Mediator. It can call out a C++ or Java or .NET function. It can also call other Integration Server services to manipulate the SOAP message.

The input pipeline for a webMethods IS service should have the following input variables:

- **proxy.name:** This is the name of the virtual service.
- **SOAPEnvelope:** Contains the SOAP envelope. This is of the Java type `org.apache.axiom.soap.SOAPEnvelope`.
- **EnvelopeString:** Contains the SOAP envelope as a string.

Limitation: **EnvelopeString** will *not* be sent to IS services if a request uses the "MTOM" SOAP Optimization Method and if the Integration Server property `watt.server.SOAP.MTOMStreaming.enable` is set to true.

- **MessageContext:** Mediator will automatically place a `MessageContext` variable into the pipeline before executing the webMethods IS service call. `MessageContext` is of the Java type `org.apache.axis2.context.MessageContext`.

Integration Server users can use the Axis2 `MessageContext` object to manipulate the incoming SOAP request. The Integration Server provides built-in services (i.e., the `pub.soap.*` services) to work with the `MessageContext` object to get/set/modify the SOAP body, header, properties, etc. Integration Server users should use these services to extract the information they need from the `MessageContext` to build the necessary business logic. Users do not need to understand Axis2 or Axiom (the xml object model based on StAX) to work with the SOAP request, because if they are familiar with the Integration Server `pub.soap` services, they can accomplish most of the tasks. For more information about these related Integration Server services, see the *webMethods Integration Server Built-In Services Reference*.

- **JSONRESTContentString:** Will appear only for REST services with the Content-Type `application/json` or `application/json/badgerfish`. For more information, see ["Multiple Root Nodes in JSON REST Services" on page 306](#).
- **UpdatedJSONRESTContentString:** Will appear only for REST services with the Content-Type `application/json` or `application/json/badgerfish`. For more information, see ["Multiple Root Nodes in JSON REST Services" on page 306](#).

You can use the following constructs in a webMethods IS service:

- Predefined or custom context variables. For more information, see [Using Context Variables in Virtual Services](#).
- The Security API provided by Mediator (for SOAP-based services only). For more information, see ["Using the Security API in webMethods IS Services" on page 249](#).

Using the Security API in webMethods IS Services

Note: This API is for SOAP-based services only.

Mediator provides Java services that you can use to support WS-Security functionality in a webMethods IS service that you invoke in the Request Processing step.

pub.mediator.security.ws:AddUsernameToken

Adds the WS-Username Token 1.0 and 1.1 to the request. This service includes the following input parameters:

Note: For reasons of legibility some of the examples below contain break lines and might not work when pasted into applications or command line tools.

In the parameter descriptions, the data type is listed first, followed by the Java type in parenthesis, for example, "Object (org.apache.axis2.context.MessageContext)".

Input Parameters

<i>username</i>	String (String) (Required) The value that will be added as the Username element in the token. The default value is: ""
<i>MessageContext</i>	Object (org.apache.axis2.context.MessageContext) (Required) Mediator will place a <i>MessageContext</i> variable into the pipeline before executing the webMethods IS service call. The default value is: org.apache.axis2.context.MessageContext instance
<i>password</i>	String (String) (Optional) The password for the token. You must specify <i>password</i> if the <i>passwordType</i> is set to either TEXT or DIGEST. The default value is: ""

<i>passwordType</i>	<p>String (String) (Optional) Specifies how the password will be added in the token. Specify one of the following values:</p> <ul style="list-style-type: none">■ NONE: The password will not be added.■ TEXT: The password is added in plain text.■ DIGEST: The password is added in digested form (as specified in the UsernameToken profile). <p>The default value is: <code>NONE</code></p>
<i>addNonce</i>	<p>Boolean (Boolean) (Optional) Specifies whether the Nonce element will be added to the token.</p> <p>The default value is: <code>false</code></p>
<i>addCreated</i>	<p>Boolean (Boolean) (Optional) Specifies whether the Created element will be added to the token</p> <p>The default value is: <code>false</code></p>
<i>salt</i>	<p>byte[] (byte[]) (Optional) The value for the /wsse11:UsernameToken/wsse:Salt element. Its value is a 128 bit number serialized as xs:base64Binary.</p> <p>The default value is: <code>null</code></p>
<i>iteration</i>	<p>int (Integer) (Optional) Indicates the number of times the hashing operation is repeated when deriving the key. It is expressed as a xs:unsignedInteger value. If it is not present, a value of 1000 is used for the iteration count.</p> <p>The default value is: <code>1000</code></p>
<i>useMac</i>	<p>Boolean (Boolean) (Optional) Indicates if the derived key will be used as a Message Authentication Code (MAC) or as a symmetric key for encryption.</p> <p>The default value is: <code>false</code></p>
<i>useBasicAuthCredentials</i>	<p>Boolean (Boolean) (Optional) If this parameter is set to <code>true</code>, Mediator will try to use the username and password from the "Authorization" HTTP header. In this case the 'username' and 'password' fields need not be specified.</p> <p>The default value is: <code>false</code></p>
<i>actor</i>	<p>String (String) (Optional) Indicates the value of the SOAP actor attribute if a new security header is being added to the SOAP</p>

request. If the request already has a security header with the actor specified in it, then this value will not overwrite it.

The default value is: ""

mustUnderstand **Boolean (Boolean)** (Optional) Specifies whether the security header will have the `mustUnderstand` attribute set to 0 or 1 (false / true). If the security header already has this attribute set, this value will not overwrite it.

The default value is: `false`

pub.mediator.security.ws:AddX509Token

Adds a X.509 certificate (or certificate chain) as a BinarySecurityToken (BST) element in the outbound SOAP request. This service includes the following input parameters:

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In the parameter descriptions, the data type is listed first, followed by the Java type in parenthesis, for example, "Object (org.apache.axis2.context.MessageContext)".

Input Parameters

MessageContext **Object (org.apache.axis2.context.MessageContext)** (Required)
Mediator will place a *MessageContext* variable into the pipeline before executing the webMethods IS service call.

The default value is: org.apache.axis2.context.MessageContext instance

keystoreFile **String (String)** (Required) The absolute path to a keystore file on the system where Mediator is running.

The default value is: ""

keystorePassword **String (String)** (Required) The password for the keystore.

The default value is: ""

keystoreType **String (String)** (Optional) The type of keystore represented by the file (can be `JKS`, `JCEKS`, or `PKCS12`).

The default value is: `JKS`

<i>keyAlias</i>	String (String) (Required) The key alias whose X509 certificate will be sent in the soap request as a BST. The default value is: ""
<i>useCertificatePath</i>	Boolean (Boolean) (Optional) If set to <code>true</code> will use the entire certificate chain represented by the key alias instead of just a single certificate. The default value is: <code>false</code>
<i>actor</i>	String (String) (Optional) Indicates the value of the SOAP actor attribute if a new security header is being added to the SOAP request. If the request already has a security header with the actor specified in it, then this value will not overwrite it. The default value is: ""
<i>mustUnderstand</i>	Boolean (Boolean) (Optional) Specifies whether the security header will have the <code>mustUnderstand</code> attribute set to 0 or 1 (false / true). If the security header already has this attribute set, then this value will not overwrite it. The default value is: <code>false</code>

pub.mediator.security.ws:AddSamlSenderVouchesToken

This service enables a Security Token Service (STS) client to send a WS-Trust request to a configured STS to obtain a SAML v1/v2 assertion. For the details about configuring Mediator to act as an STS client, see *Administering webMethods Mediator*.

This service adds the obtained SAML assertion to the original request that is sent by the client to the native service, and includes the following parameters.

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In the parameter descriptions, the data type is listed first, followed by the Java type in parenthesis, for example, "Object (org.apache.axis2.context.MessageContext)".

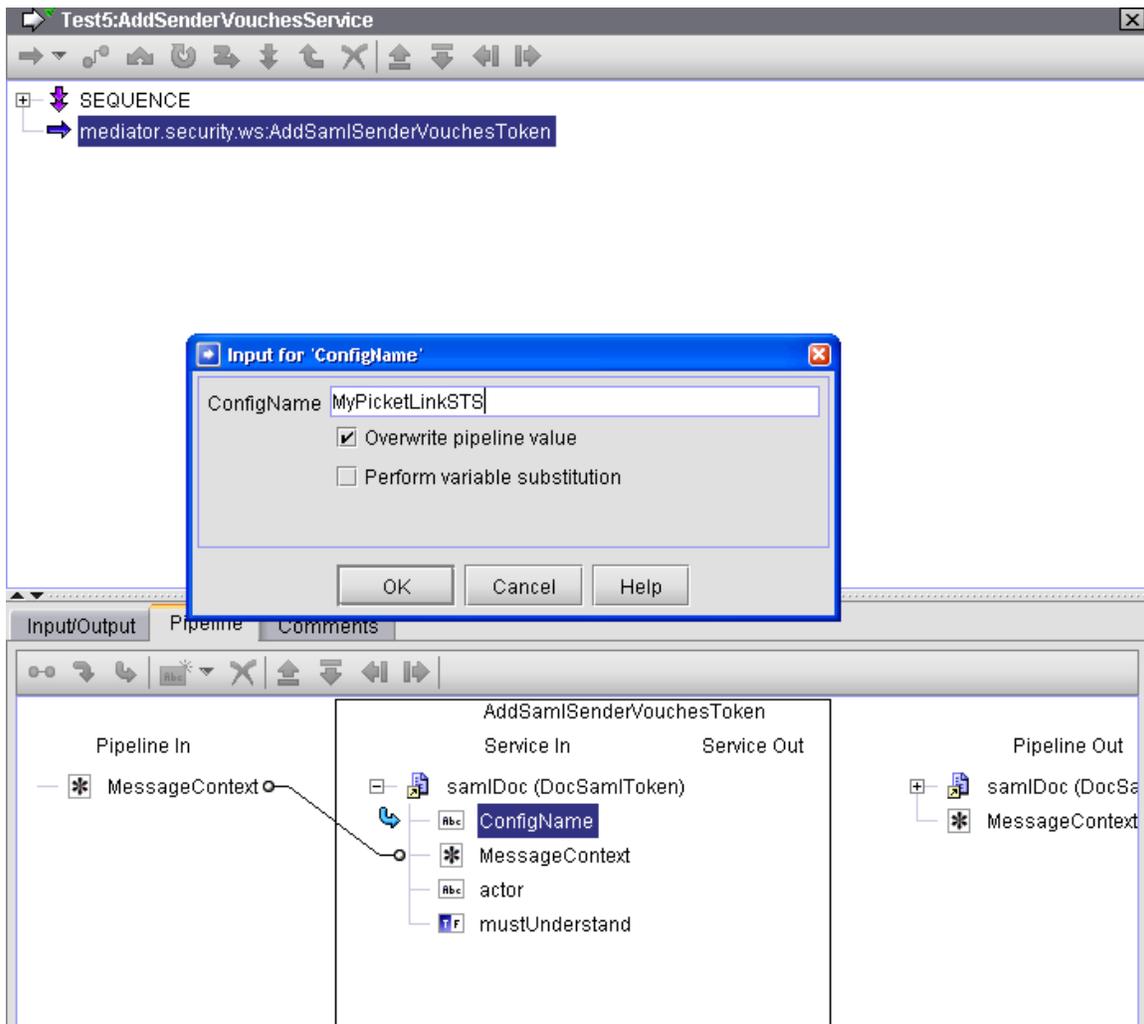

Input Parameters

<i>ConfigName</i>	String (String) (Required) References a previously configured STS configuration name. The default value is: ""
-------------------	--

<i>MessageContext</i>	Object (org.apache.axis2.context.MessageContext) (Required) Mediator will place a <i>MessageContext</i> variable into the pipeline before executing the webMethods IS service call. The default value is: org.apache.axis2.context.MessageContext instance
<i>addTimeStamp</i>	Boolean (Boolean) (Optional) Adds a Timestamp element (with the duration specified in <i>timeToLive</i>) to the WS-Security header of the request, and includes it in the signature. (The other items that are signed are the body and SAML assertion.) The default value is: false
<i>timeToLive</i>	Integer (Integer) (Optional) If <i>addTimeStamp</i> is true, <i>timeToLive</i> specifies the duration (in seconds) for which the request is valid. The default value is: 300 (5 minutes)
<i>actor</i>	String (String) (Optional) Indicates the value of the SOAP actor attribute if a new security header is being added to the SOAP request. If the request already has a security header with the actor specified in it, then this value will not overwrite it. The default value is: ""
<i>mustUnderstand</i>	Boolean (Boolean) (Optional) Specifies whether the security header will have the mustUnderstand attribute set to 0 or 1 (false / true). If the security header already has this attribute set, then this value will not overwrite it. The default value is: false

Example of using AddSamlSenderVouchesToken

The sample service shown below is configured by providing the *MessageContext* and *ConfigName* parameters. The value of *ConfigName* must be the name of a previously configured STS name, which is configured on the Mediator Configuration page.

pub.mediator.security.ws:AddTimestamp

Adds a timestamp to the outbound SOAP request WS-Security header. This service includes the following input parameters:

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In the parameter descriptions, the data type is listed first, followed by the Java type in parenthesis, for example, "Object (org.apache.axis2.context.MessageContext)".

Input Parameters

timeToLive **Integer (Integer)** (Optional) Specifies the duration (in seconds) for which the request is valid.

The default value is: 300 (5 minutes)

signTimestamp **Boolean (Boolean)** (Optional) Indicates whether the generated timestamp must be signed by Mediator using the configured keystore and signing alias.

Note: For *signTimestamp* to work, you must ensure that a valid IS keystore and signing alias are configured in Mediator. For details, see *Administering webMethods Mediator*.

The default value is: false

useMilliSecond Precision **Boolean (Boolean)** (Optional) Indicates whether the generated timestamp must have millisecond precision.

The default value is: true

MessageContext **Object (org.apache.axis2.context.MessageContext)** (Required) Mediator will place a *MessageContext* variable into the pipeline before executing the webMethods IS service call.

The default value is: org.apache.axis2.context.MessageContext instance

actor **String (String)** (Optional) Indicates the value of the SOAP actor attribute if a new security header is being added to the SOAP request. If the request already has a security header with the actor specified in it, then this value will not overwrite it.

The default value is: ""

mustUnderstand **Boolean (Boolean)** (Optional) Specifies whether the security header will have the mustUnderstand attribute set to 0 or 1 (false / true). If the security header already has this attribute set, then this value will not overwrite it.

The default value is: false

pub.mediator.addressing:AddWSAddressingHeaders

Adds WS-Addressing headers to a SOAP request sent by the client before Mediator forwards the request to the native service.

This service includes the following input parameters:

Note: For reasons of legibility some of the examples below contain break lines and may not work when pasted into applications or command line tools.

In the parameter descriptions, the data type is listed first, followed by the Java type in parenthesis, for example, "Object (org.apache.axis2.context.MessageContext)".

Input Parameters

isVersionSubmission

Boolean (Boolean) (Optional) The WS-Addressing version that should be used.

- If true, the WS-Addressing submission namespace will be used.

```
http://schemas.xmlsoap.org/ws/2004/08/addressing
```

- If false, the Final specification namespace will be used.

```
http://www.w3.org/2005/08/addressing
```

The default value is: `false`

To

String (String) (Optional) This value corresponds to the `/wsa:To` addressing header. You must specify a value that corresponds to the destination of the request message.

If this value is not specified, the default value depends on the *isVersionSubmission* property value. One of the following anonymous EPR values will be sent:

- If *isVersionSubmission* is set to `true`, the anonymous EPR value is:

```
http://schemas.xmlsoap.org/ws/2004/08/addressing/role/anonymous
```

- If *isVersionSubmission* is set to `false`, the anonymous EPR is:

```
http://www.w3.org/2005/08/addressing/anonymous
```

From

String (String) (Optional) This value corresponds to the `/wsa:From` addressing header and refers to the source of the message.

The default value is: ""

Action

String (String) (Optional) This value corresponds to the / `wsa:Action` addressing header. By default, this property has the same value as the operation on the virtual service being invoked (which will usually correspond to the same operation on the native service). But the user can specify a different value corresponding to the native service being called.

The default value is: URI identifying input operation corresponding to a WSDL port type being called on the virtual service

MessageContext

Object (org.apache.axis2.context.MessageContext) (Required) Mediator will place a *MessageContext* variable into the pipeline before executing the webMethods IS service call.

The default value is: `org.apache.axis2.context.MessageContext` instance

actor

String (String) (Optional) Indicates the value of the SOAP actor attribute if a new security header is being added to the SOAP request. If the request already has a security header with the actor specified in it, then this value will not overwrite it.

The default value is: ""

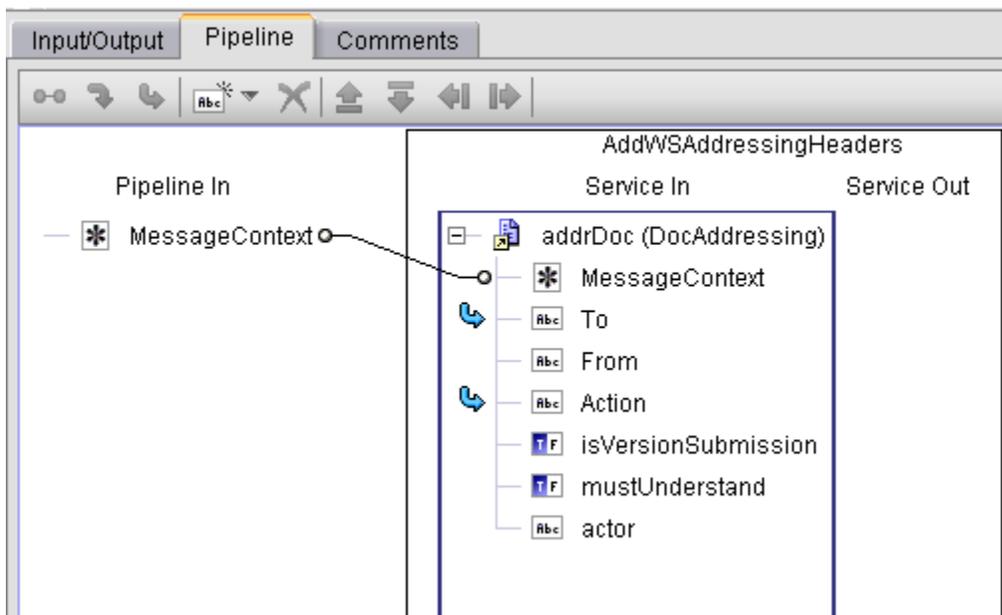

mustUnderstand

Boolean (Boolean) (Optional) Specifies whether the security header will have the `mustUnderstand` attribute set to 0 or 1 (false / true). If the security header already has this attribute set, this value will not overwrite it.

The default value is: `false`

Example of using `AddWSAddressingHeaders`

The sample service shown below is configured by providing the `MessageContext` parameter.

6 Using Context Variables in Virtual Services

■ Introduction to Context Variables in Virtual Services	260
■ The Predefined Context Variables	260
■ The API for Context Variables	265

Introduction to Context Variables in Virtual Services

Mediator provides predefined context variables, and you can declare your own custom context variables. You can use both predefined and custom context variables when you configure various processing steps of a virtual service. Specifically, you can use them:

- In a webMethods IS service that you create and invoke during the **Request Processing** step or the **Response Processing** step.
- In a routing rule that you create in the **Context-Based Routing Protocols** step.

The Predefined Context Variables

You can use the predefined context variables listed below. Any context variable state defined during the inbound request processing steps will still be available during the outbound response processing steps.

Note: Keep the following in mind:

- To set, get or remove the predefined context variables, use "[The API for Context Variables](#)" on page 265 provided by Mediator.
- You do not need to declare the predefined context variables. If you attempt to declare an existing predefined context variable, an error will occur.

Context Variable Display Name and Variable Name	Description
Average Response AVG_SUCCESS_TIME	The average amount of time it took the service to complete all invocations in the current interval. This is measured from the moment Mediator receives the request until the moment it returns the response to the caller. <div style="border: 1px solid #ccc; padding: 5px; margin-top: 10px;"> <p>Note:By default, Average Response Time does not include metrics for failed invocations. You can include metrics for failed invocations by setting the <code>pg.PgMetricsFormatter.includeFaults</code> parameter to true. For details about advanced settings, see <i>Administering webMethods Mediator</i>.</p> </div>
Client IP Address	The IP address used to send the request to Mediator.

Context Variable Display Name and Variable Name	Description
INBOUND_IP	
Consumer CONSUMER_APPLICATION	The name of the consumer application accessing the service, if known.
Fault Count INTERVAL_FAULT_COUNT	The number of service faults for the interval.
Inbound Content Type MESSAGE_TYPE	A Content-Type defined in axis2.xml for a message formatter. This value must be a key in the axis2 message formatters list, since it is used to control message serialization. (The valid choices are defined as attributes of <messageFormatters/> group in the Integration Server's axis2.xml configuration.)
Inbound HTTP Method INBOUND_HTTP_METHOD	The HTTP method used by the client to send the request (GET, POST, PUT, DELETE, Use Context Variable).
Inbound Protocol INBOUND_PROTOCOL	The protocol (HTTP or HTTPS) of the request.
Maximum Response SLOWEST_SUCCESS_INVOKE	Maximum Response Time. Note: By default, Maximum Response Time does not include metrics for failed invocations. You can include metrics for failed invocations by setting the <code>pg.PgMetricsFormatter.includeFaults</code> parameter to true. For details about advanced settings, see <i>Administering webMethods Mediator</i> .
Mediator Host Name MEDIATOR_HOSTNAME	Mediator host name.
Mediator IP Address MEDIATOR_IP	Mediator IP address.

Context Variable Display Name and Variable Name	Description
Mediator Target Name TARGET_NAME	Mediator target name.
Minimum Response FASTEST_SUCCESS_INVOKE	Minimum Response Time. Note: By default, Minimum Response Time does not include metrics for failed invocations. You can include metrics for failed invocations by setting the <code>pg.PgMetricsFormatter.includeFaults</code> parameter to true. For details about advanced settings, see <i>Administering webMethods Mediator</i> .
Outbound HTTP Method ROUTING_METHOD	The HTTP method to be sent to the native service if the inbound HTTP method is custom. Otherwise, this value will be null. For more information, see " Changing the HTTP Method of a REST or XML Request " on page 291.
Success Count INTERVAL_SUCCESS_COUNT	The number of success counts for a given service.
Total Count INTERVAL_TOTAL_COUNT	The total number of counts for a given service.
Virtual Service Name SERVICE_NAME	Virtual service name.
N/A BUILDER_TYPE	A Content Type defined in axis2.xml for a message builder. This value must be a key in the axis2 message builders list, since it is used to control building of native service response messages. (The valid choices are defined as attributes of <messageBuilders/> group in the Integration Server's axis2.xml configuration.)
N/A, no display name INBOUND_REQUEST_URI	A partial reference to a virtual service (for HTTP/HTTPS only). The protocol, host and

Context Variable Display Name and Variable Name	Description
	<p>port are not part of the value. For example, if the following virtual service is invoked:</p> <pre data-bbox="717 432 1154 464">http://mcusawco:5555/ws/TC1</pre> <p>then the expected value of this variable would be <code>/ws/TC1</code>.</p> <p>For a REST or XML service, the URL might also include query string parameters. For example, if the following virtual service is invoked:</p> <pre data-bbox="717 695 1312 726">http://mcusawco:5555/ws/cars?vin=1234</pre> <p>the expected value of this variable would be <code>/ws/cars?vin1234</code>.</p> <p>This is useful to know because by the time you are able to access the request inside of Mediator, the REST request would contain a top-level element that looks like this:</p> <pre data-bbox="717 993 963 1024"><vin>1234</vin></pre> <p>So it is not obvious from an XSLT expression or a webMethods IS service callout what part of a REST request came in as a query parameter.</p> <p>Therefore, using this variable along with <code>INBOUND_HTTP_METHOD</code> and <code>INBOUND_PROTOCOL</code>, you can determine the exact entry point URI that was used when a virtual service was invoked.</p>
N/A, no display name	<p>The reason returned by the native service provider in the case where it produced a SOAP fault. This will not contain Mediator errors such as security policy enforcement errors. This variable will only contain the “reason” text wrapped in a SOAP fault.</p> <div data-bbox="727 1598 1370 1913" style="background-color: #f0f0f0; padding: 10px;"> <p>Note:When you are using this variable in a custom fault message that you are specifying in the Response Processing Step, note the following. If a request is denied due to security policy enforcement, the fault handler variable <code>\$ERROR_MESSAGE</code> variable would contain a native service provider error message or other error messages that</p> </div>

Context Variable Display Name and Variable Name	Description
	result from enforced security assertions. However, \$NATIVE_PROVIDER_ERROR will be null in this case.
N/A, no display name OPERATION	The virtual service operation selected to execute a request.
N/A, no display name PROTOCOL_HEADERS	Contains a map of key-value pairs in the request, where the values are typed as strings. To get/set this variable, see <code>pub.mediator.ctxvar:getContextVariable</code> .
N/A, no display name SOAP_HEADERS	(For use in webMethods IS services only.) Contains an array of the SOAP header elements in the request. To get/set this variable, see <code>pub.mediator.ctxvar:getContextVariable</code> .
N/A, no display name USER	The value defined for the Integration Server session executing the request message. If the request is not authenticated, it will use a default unprivileged account. Otherwise, it will set the Integration Server session to the user credentials used for transport security. Also, if credentials were included for message based security (e.g., an X509 token was included and this certificate was mapped to an Integration Server user), then this information would override any transport security (e.g., basic authentication).
Note:	<p>When you use predefined context variables in a custom error message in "The Response Processing Step (REST/XML)" on page 71, note the following:</p> <ul style="list-style-type: none"> ■ To reference a predefined context variable in a custom fault message, you need to prepend a \$ symbol to the context variable name to indicate that variable's value should be referenced. Think of this usage as being similar to the '&' address operation for C variables. A predefined context variable expression might look like this: <code>\$USER="Administrator:"</code> ■ The \$ reference symbol may appear in the text as needed. (e.g., as a currency symbol). There is no escape concept used with this operator. That is, no special meaning is attached to two occurrences of this symbol: "\$\$".

- If no value is defined for a valid context variable reference, the string is left unmodified for that context variable.

The API for Context Variables

Mediator provides an API that you can use to:

- Set, get, declare and remove custom context variables.
- Set and get the predefined context variables. (It is not necessary (or even legal) to declare or remove the predefined context variables.)

Mediator provides the following Java services, which are defined in the class `ISMediatorRuntimeFacade.java`.

- `pub.mediator.ctxvar:getContextVariable`
- `pub.mediator.ctxvar:setContextVariable`
- `pub.mediator.ctxvar:declareContextVariable`
- `pub.mediator.ctxvar:removeContextVariable`

Sample flow services are described in this section as well.

- [Sample Flow Service: Getting a Context Variable Value](#)
- [Sample Flow Service: Setting a Context Variable Value](#)

`pub.mediator.ctxvar:getContextVariable`

Use this Java service to retrieve a context variable's value and assign it to a pipeline variable. All parameter names are case-sensitive.

Parameter	Pipeline Type	Data Type	Description	Examples
MessageContext	in	Object ref	This object is inserted into the pipeline by Mediator.	N/A
varName	in	String	Context variable name (predefined or custom).	PROTOCOL_HEADERS SOAP_HEADERS mx: CUSTOM_VAR

Parameter	Pipeline Type	Data Type	Description	Examples
serValue	out	Object ref	Java.io.Serializable value. (Usually a string).	

Notes on Getting and Setting the `PROTOCOL_HEADERS` and `SOAP_HEADERS` Variables

All context variable values are typed as either "string" or "int" except for the predefined context variables `PROTOCOL_HEADERS` and `SOAP_HEADERS`, which are of the type "IData". You can set/get values for `PROTOCOL_HEADERS` and `SOAP_HEADERS` in one of two ways:

- **Set/get the entire structure.**

To set the entire structure, you must:

- Set the `varName` parameter in `pub.mediator.ctxvar:setContextVariable` to `PROTOCOL_HEADERS` or `SOAP_HEADERS`.
- Use the method `ISMediatorRuntimeFacade.setContextVariableValue()`.

To get the entire structure, you must:

- Set the `varName` parameter in `pub.mediator.ctxvar:getContextVariable` to `PROTOCOL_HEADERS` or `SOAP_HEADERS`.
- Use the method `ISMediatorRuntimeFacade.getContextVariableValue()`.

If `varName` is set to `PROTOCOL_HEADERS`, you will get/set the entire `IData` structure containing all of the transport headers. The key is the transport header name (e.g., `Content-Type`) and the value is a `String`. The `IData` object for `PROTOCOL_HEADERS` will contain a set of string values where each `IData` string key matches the header name in the transport headers map. The set of possible keys includes the HTTP v1.1 set of headers as well as any custom key-value pairs you might have defined.

If `varName` is set to `SOAP_HEADERS`, you will get/set the entire `IData` structure containing all of the SOAP headers in the SOAP envelope. The key is the array position starting with '0', and the value is an `Axiom OMElement` containing that SOAP header block.

Alternatively, you can set the `varName` parameter to address a specific element in the array. For example, setting it to `PROTOCOL_HEADERS[Content-Type]` would apply to the `Content-Type` transport header. Similarly, setting it to `SOAP_HEADERS[0]` would return a `String` representation of the first SOAP header block (as opposed to an `Axiom OMElement`).

- **Set/get a nested value.**

Set a nested value in one of the following ways:

- Set the `varName` parameter in `pub.mediator.ctxvar:setContextVariable` to `PROTOCOL_HEADERS[arrayElement]`, where `[arrayElement]` refers to a specific element. For example, `PROTOCOL_HEADERS[Content-Type]` or `SOAP_HEADERS[0]` (to indicate the first array element in the set).
- Alternatively, use the method `ISMediatorRuntimeFacade.setContextVariableValue()`. You would use this method only if you are writing a Java service and you want to access it through the Java source code.

Get a nested value in one of the following ways:

- Set the `varName` parameter in `pub.mediator.ctxvar:getContextVariable` to `PROTOCOL_HEADERS[arrayElement]`, where `[arrayElement]` refers to a specific element. For example, `PROTOCOL_HEADERS[Content-Type]` or `SOAP_HEADERS[0]` (to indicate the first array element in the set).
- Alternatively, use the method `ISMediatorRuntimeFacade.getContextVariableValue()`. You would use this method only if you are writing a Java service and you want to access it through the Java source code.

You can set/get a nested value inside `PROTOCOL_HEADERS` and `SOAP_HEADERS` via an additional `keyName`. In this case, the object reference will *not* be an `IData` object.

- For `PROTOCOL_HEADERS`, the `keyName` must match the transport header name in a case-sensitive manner (e.g., `PROTOCOL_HEADERS[Content-Type]` or `PROTOCOL_HEADERS[Authorization]`). In this case, the `Serializable` value will be a string.
- For `SOAP_HEADERS`, the `keyName` must match the 0-based array element. If a request has a SOAP security header element (i.e. `</wsse:Security>`), then it would be addressed as `SOAP_HEADERS[0]`. In this case, the element will be in its string format.

pub.mediator.ctxvar:setContextVariable

Use this Java service to set a value on a context variable. The pipeline variable containing the context variable value should be an object reference that implements `java.io.Serializable`. All parameter names are case-sensitive.

Parameter	Pipeline Type	Data Type	Description	Examples
-----------	---------------	-----------	-------------	----------

MessageContext	in	Object ref	This object is inserted into the pipeline by Mediator.	N/A
----------------	----	------------	--	-----

Parameter	Pipeline Type	Data Type	Description	Examples
varName	in	String	Context variable name (predefined or custom).	PROTOCOL_HEADERS SOAP_HEADERS mx: CUSTOM_VAR
serValue	in	Object ref	Java.io.serializable value. (Usually a string).	

pub.mediator.ctxvar:declareContextVariable

Use this Java service to declare a *custom* context variable. All custom-defined context variables must be declared in a custom namespace that is identified by using the prefix `mx` (e.g., `mx: CUSTOM_VARIABLE`). All parameter names are case-sensitive.

Note: It is not legal to use this service to declare the predefined context variables; you can only declare custom variables.

Parameter	Pipeline Type	Data Type	Description
ctxVar	in	Object ref	The document type defining the context variable object. Use the <code>ctxVar</code> Document Type provided in the Java service <code>pub.mediator.ctxvar:ctxVar</code> and map it to this input variable. Define the name (for example, <code>mx: CUSTOM_VARIABLE</code>), the <code>schema_type</code> (string or int), and <code>isReadOnly</code> (true or false).
ctxVar	out	Object ref	The set Context variable document type.
varNameQ	out	Object ref	<code>javax.xml.namespace.QName</code> value. The <code>QName</code> of the variable.

Note the following:

- After declaring the context variable, you can use the `setContext` variable to set a value on the context variable.
- You do *not* need to declare the following kinds of context variables:
 - The predefined context variables provided by Mediator. If you attempt to declare an existing predefined context variable, an error will occur.
 - Any custom context variable that you define in a routing rule that you create in the context-based routing step.
- Any custom context variables that you explicitly declare in source code using the API will have a declaration scope of `SESSION`.
- Any custom context variable's state that is defined during the inbound request processing steps will still be available during the outbound response processing steps.
- All context variable values are typed as either "string" or "int" (excluding the `SOAP_HEADERS` and `PROTOCOL_HEADERS` variables, which are of the type "IData").
- Valid names should be upper case (by convention) and must be a valid Java Identifier. In general, use alpha-numeric, \$ or _ symbols to construct these context names. Names with punctuation, whitespace or other characters will be considered invalid and will fail deployment.
- All custom context variables must be declared in a custom namespace that is identified by using an `mx` prefix (e.g. `mx:CUSTOM_VARIABLE`).
- To reference a custom context variable in a flat string, you need to prepend a \$ symbol to the context variable name to indicate that variable's value should be referenced. Think of this usage as being similar to the '&' address operation for C variables.

An expression that references a custom context variable might look like this:

```
$mx:TAXID=1234 or $mx:ORDER_SYSTEM_NAME="Pluto"
```

Notice that the values of the data type "int" are not enclosed in quotation marks, while the values of the data type "string" are. The quotation marks are only needed if a context variable *expression* (as opposed to a reference) is defined.

- Referencing an undefined context variable does not result in an error.
- Once a variable has been declared it cannot be declared again.

pub.mediator.ctxvar:removeContextVariable

Use this Java service to remove a *custom* context variable from a request/response session. All parameter names are case-sensitive.

Note: Keep the following in mind:

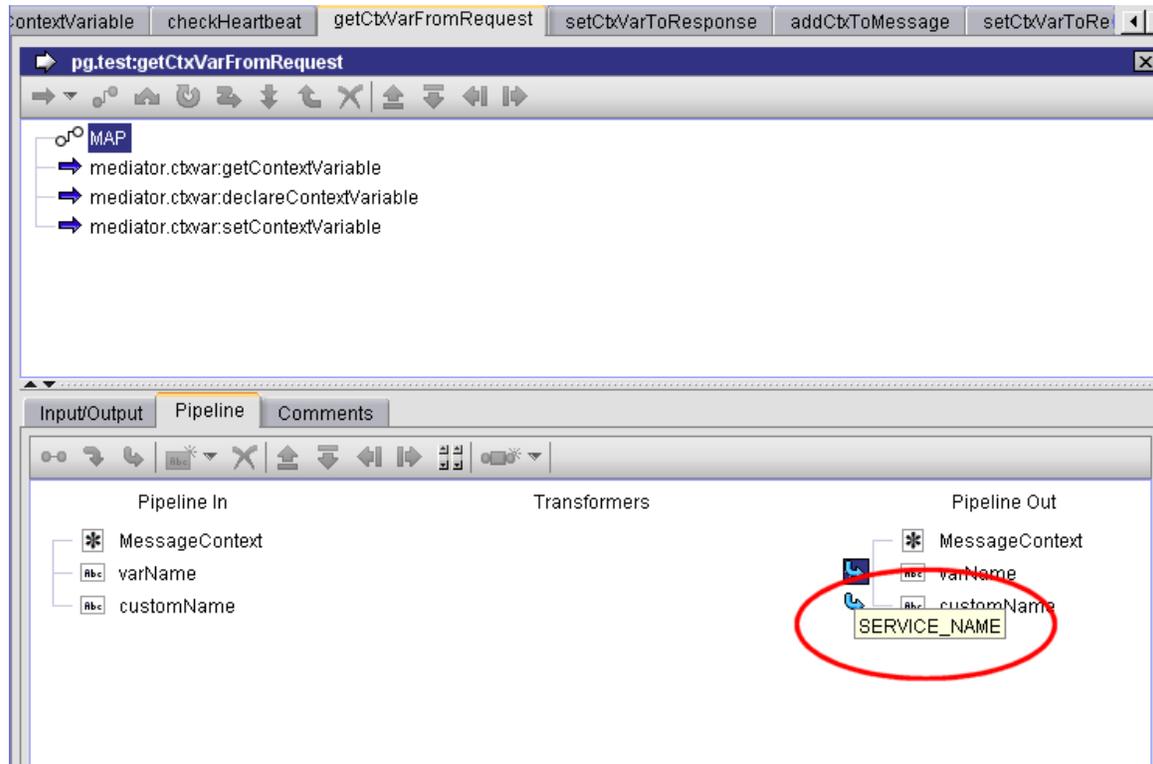

- It is not legal to use this service to remove any predefined context variables; you can only remove custom variables.
- Attempting to remove a non-existent context variable will *not* result in an error.

Parameter	Pipeline Type	Data Type	Description	Examples
MessageContext	in	Object ref	This object is inserted into the pipeline by Mediator.	N/A
varName	in	String	Custom context variable name.	mx:CUSTOM_VAR

Sample Flow Service: Getting a Context Variable Value

This flow service gets the value of a custom context variable from a request. The service declares a context variable using the name defined in the pipeline variable `customName` (i.e., `mx:COMP_TEST`). It is hard-coded to store the predefined context variable `SERVICE_NAME` in this custom context variable name.

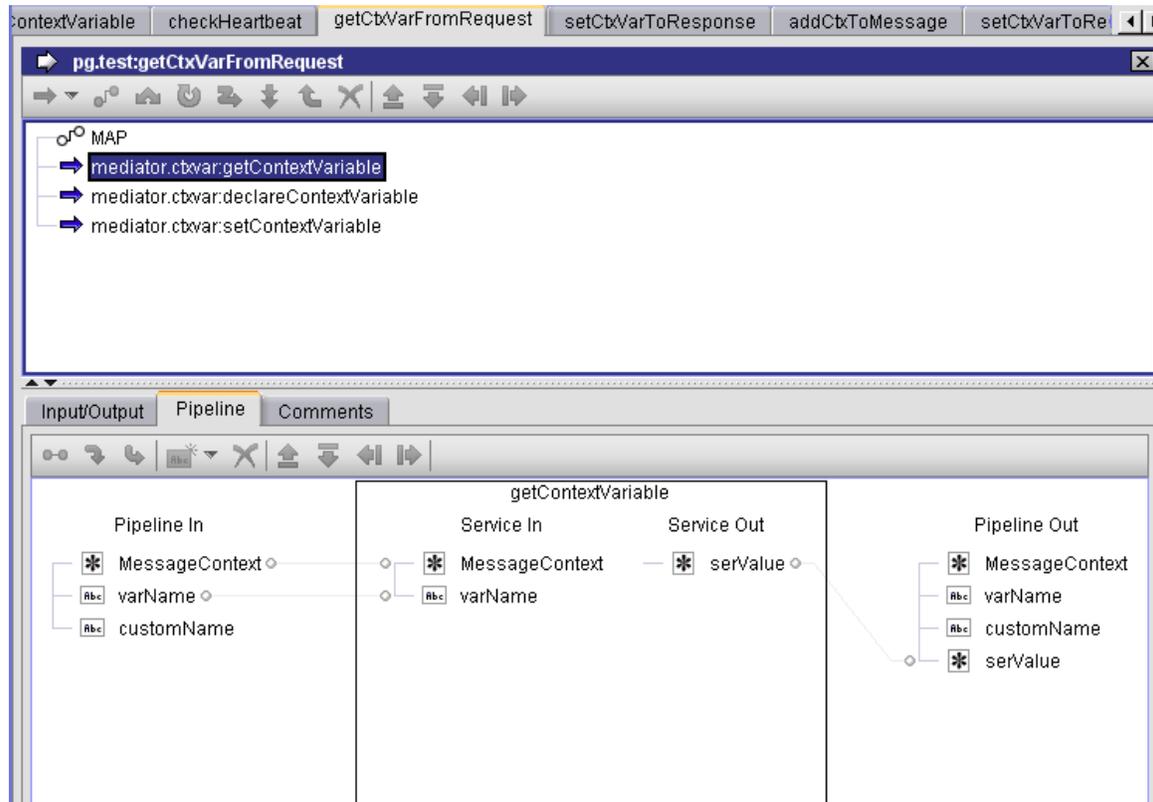

Step 1. Setting varName and customName

In this flow service, the following pipeline variables that are hard-coded as follows:

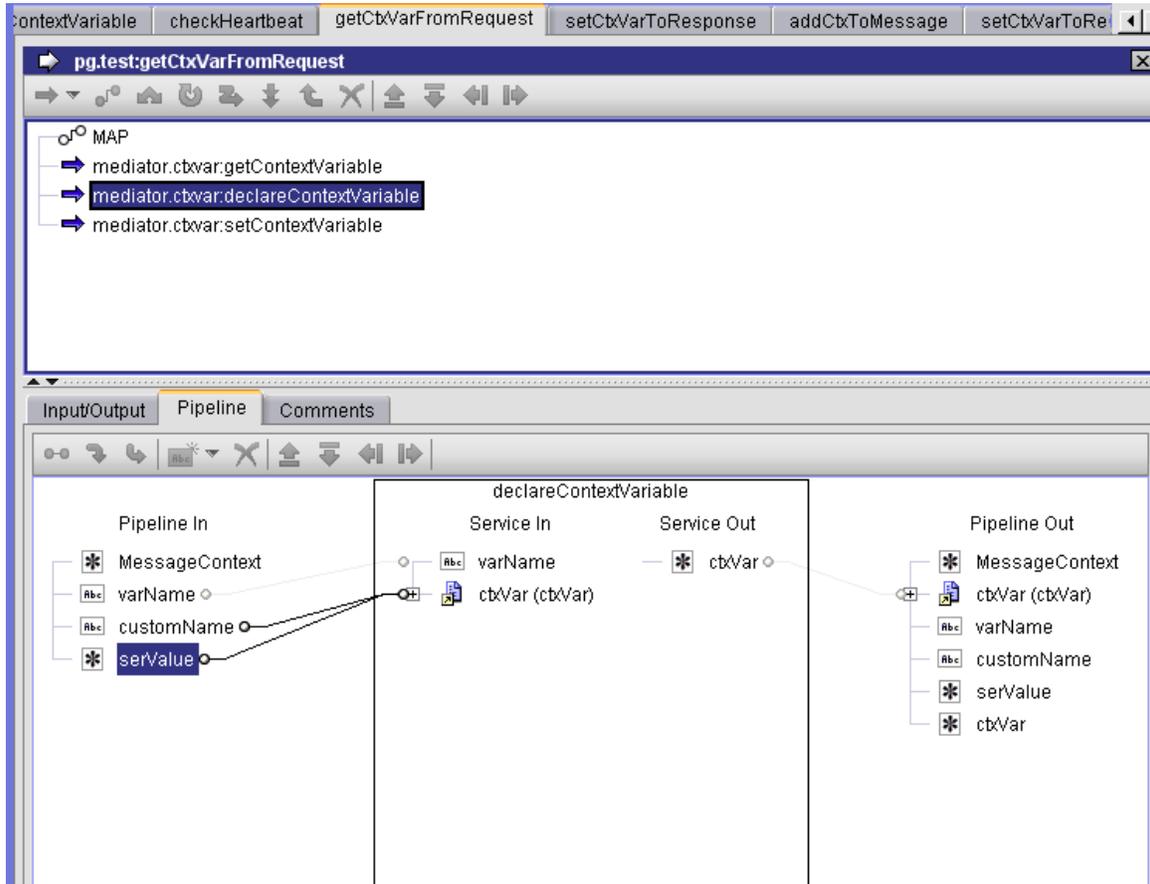

- varName is set to the predefined context variable SERVICE_NAME.
- customName is set to mx:COMP_TEST. SERVICE_NAME is stored in customName in the "Pipeline Out".

Step 2. Calling the `pub.mediator.ctxvar:getContextVariable` service

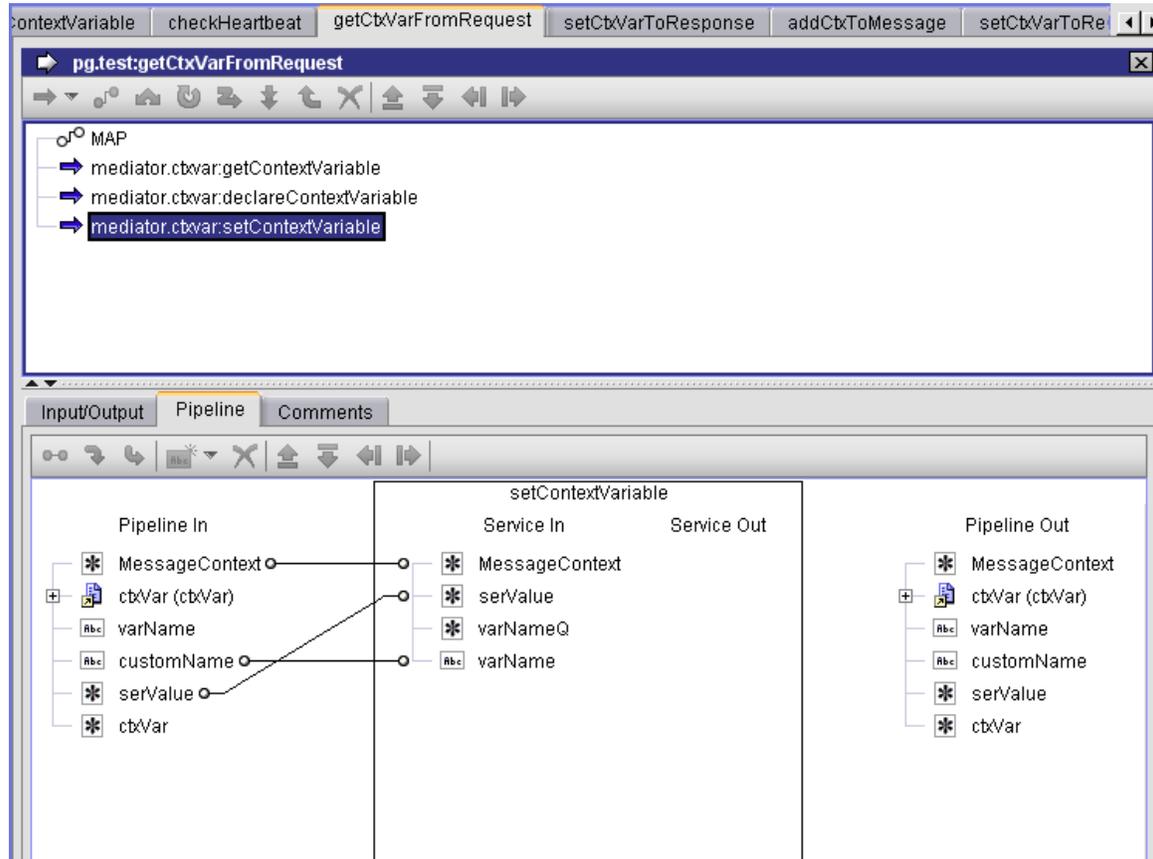

The call to `pub.mediator.ctxvar:getContextVariable` looks up the context variable value for the "Pipeline In" variable `varName` and sets the `Serializable` value in the output pipeline variable named `serValue`.

Step 3. Calling the `pub.mediator.ctxvar:declareContextVariable` service

The call to `pub.mediator.ctxvar:declareContextVariable` takes the serialized value we looked up for `varName` and assigns it to a newly declared custom context variable named `ctxVar`.

Step 4. Calling the `pub.mediator.ctxvar:setContextVariable` service

The call to `pub.mediator.ctxvar:setContextVariable` sets the context variable value back into `MessageContext` so it will be available for the rest of the service invocation steps.

Sample Flow Service: Setting a Context Variable Value

This flow service sets the value of a custom context variable to be used in a response.

This flow service declares a pipeline variable named `customName`, which is set to the value `mx:COMP_TEST`.

This flow service will retrieve the context variable for `customName` and create an element for its context variable value in the response message return to the consumer.

Step 1. Declaring customName

The screenshot displays the CentraSite interface for configuring a virtual service pipeline. The top navigation bar includes tabs for 'contextVariable', 'checkHeartbeat', 'getCtxVarFromRequest', 'setCtxVarToResponse', and 'addCtxToMessage'. The main window title is 'pg.test:setCtxVarToResponse'. The pipeline configuration is shown in a tree view under the 'SEQUENCE' node, containing a 'MAP' node and two actions: 'mediator.ctxvar:getContextVariable' and 'pg.test:addCtxToMessage'. Below the pipeline view, the 'Input/Output' tab is active, showing a 'Specification Reference' field, 'Input' and 'Output' dropdowns, and checkboxes for 'Validate input' and 'Validate output'. The 'Input' list includes: proxy.name, SOAPEnvelope, MessageContext, EnvelopeString, varName, customName, and UpdatedSoapRequest. The 'Output' list includes: UpdatedSoapRequest, EnvelopeString, customName, and UpdatedSoapRequest.

We define the `customName` variable value to be `mx:COMP_TEST` so we can use this variable to lookup the custom variable name that was seeded in the previous example.

Step 2. Setting customName to mx:COMP_TEST

The screenshot displays the Oracle Service Bus console interface. At the top, a tab bar shows several tabs: 'contextVariable', 'checkHeartbeat', 'getCtxVarFromRequest', 'setCtxVarToResponse' (which is selected), and 'addCtxToMessage'. Below the tabs, a window titled 'pg.test:setCtxVarToResponse' is open, showing a tree view of the pipeline configuration. The tree includes a 'SEQUENCE' node, a 'MAP' node, and two action nodes: 'mediator.ctxvar:getContextVariable' and 'pg.test:addCtxToMessage'. Below this window, the 'Pipeline' tab is active, showing a comparison between 'Pipeline In' and 'Pipeline Out' variables. The 'Pipeline In' variables are: proxy.name, SOAPEnvelope, MessageContext, EnvelopeString, varName, customName, and UpdatedSoapRequest. The 'Pipeline Out' variables are: proxy.name, SOAPEnvelope, MessageContext, EnvelopeString, varName, customName, and UpdatedSoapRequest. The 'UpdatedSoapRequest' variable in the 'Pipeline Out' column is highlighted with a blue selection box. Two blue arrows point from the 'customName' variable in the 'Pipeline In' column to the 'UpdatedSoapRequest' variable in the 'Pipeline Out' column, indicating a mapping or transformation.

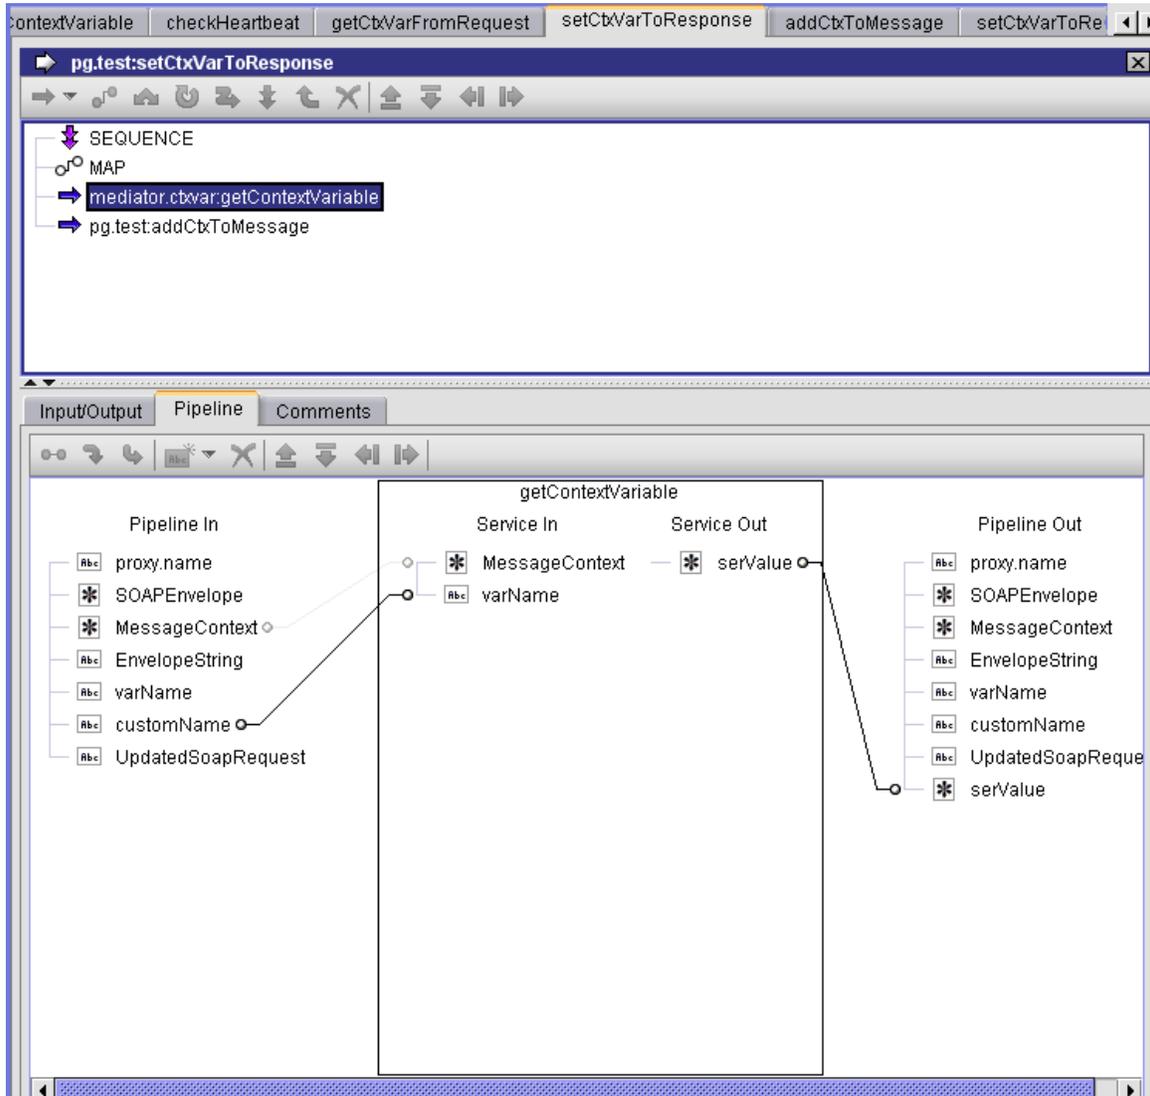

Clicking on the `customName` pipeline variable will display the name.

Step 3. Displaying the value of customName

The screenshot displays a software interface for configuring a pipeline. At the top, a tab bar shows several tabs: 'ontextVariable', 'checkHeartbeat', 'getCtxVarFromRequest', 'setCtxVarToResponse' (which is selected), 'addCtxToMessage', and 'setCtxVarToRe'. Below the tabs, the main window title is 'pg.test:setCtxVarToResponse'. The left pane shows a tree view of the pipeline structure: a 'SEQUENCE' containing a 'MAP' block, which then calls 'mediator.ctxvar:getContextVariable' and 'pg.test:addCtxToMessage'. The right pane shows the 'Pipeline Out' structure, including 'proxy.name', 'SOAPEnvelope', 'MessageContext', 'EnvelopeString', 'varName', 'customName' (highlighted in blue), and 'UpdatedSoapRequest'. In the foreground, an 'Input for 'customName'' dialog box is open, showing the text 'customName mx:COMP_TEST', a checked 'Overwrite pipeline value' checkbox, and an unchecked 'Perform variable substitution' checkbox. The dialog has 'OK', 'Cancel', and 'Help' buttons.

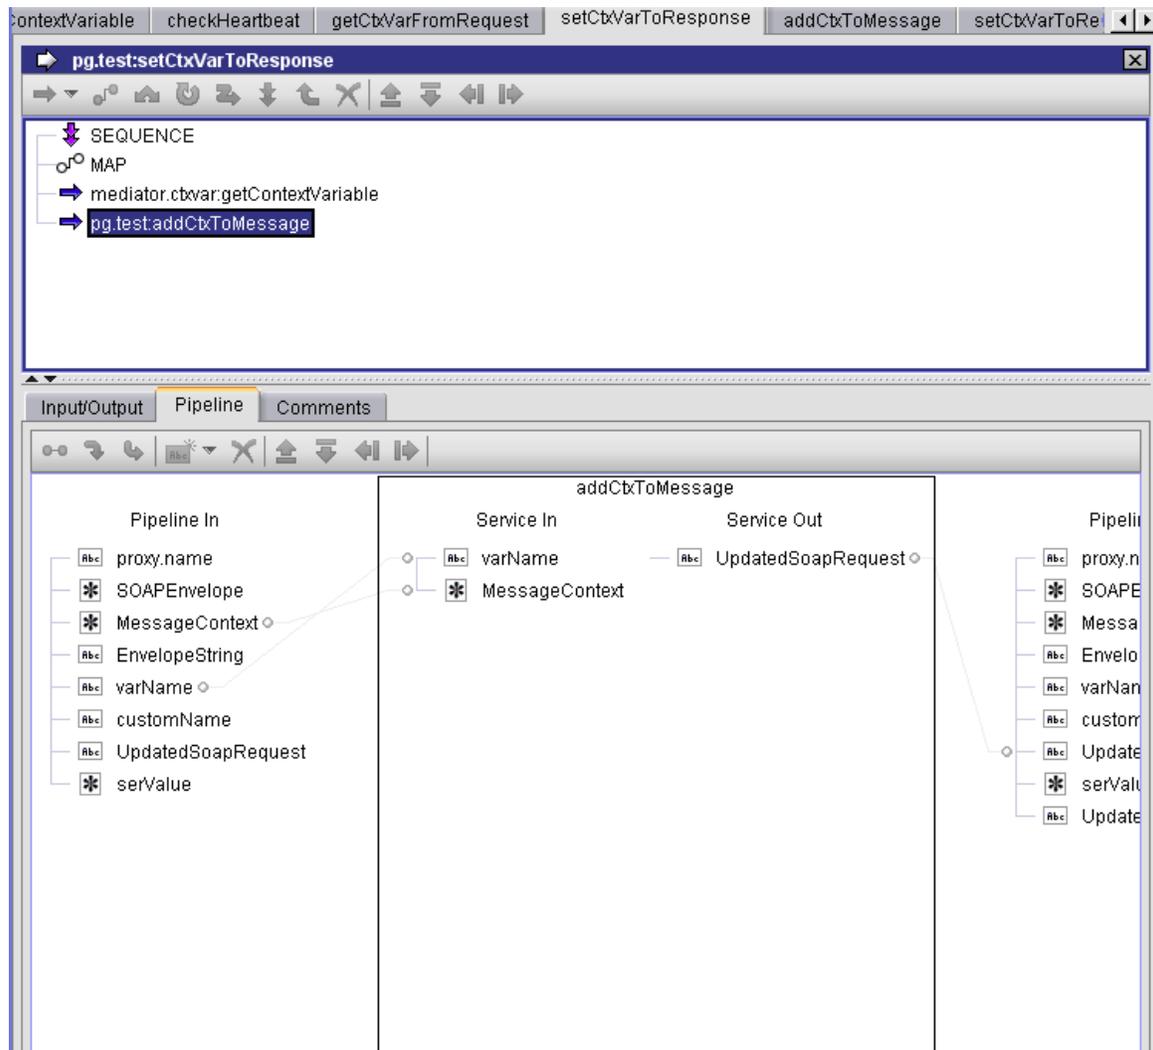

The call to `pub.mediator.ctxvar:getContextVariable` retrieves the value of the custom context variable from the context variable map.

Step 4. Calling mediator.ctxvar:getContextVariable

This is just a sample Java service that takes the context variable and creates a top-level element in the response message using the same name and value.

Step 5. Sample service using the context variable

7 Important Considerations when Configuring SOAP-based Virtual Services

■ Handling Services with Multiple Ports and Bindings	282
--	-----

Handling Services with Multiple Ports and Bindings

Mediator implicitly assumes that there is a one-to-one mapping between a WSDL service and a Virtual Service. A problem arises if a `<service>` element contains multiple `<port>` elements that point to different bindings (and consequently different port types) -- the problem is that Mediator will create a virtual service that has the operations from only *one* of the `portTypes`. Mediator chooses the first port available under `<service>` and exposes the operations corresponding to the equivalent binding/portType.

For example, consider the following WSDL fragment that shows the structure of the `portType`, `binding` and `service` elements in the WSDL. Note that there are:

- Two distinct `<portType>` elements: `SystemPortType` and `CustomerPortType`.
- Two equivalent bindings defined for each `<portType>`: `SystemBinding` and `CustomerBinding`.
- A single `<service>` element that defines the two ports with distinct endpoints (one for each binding available).

Example `<portType>` Elements

```
<portType name="SystemPortType">
  <operation name="ping">
    ...
  </operation>
</portType>
<portType name="CustomerPortType">
  <operation name="getOperation1">
    ...
  </operation>
  <operation name="getOperation2">
    ...
  </operation>
  <operation name="getOperation3">
    ...
  </operation>
  <operation name="getOperation4">
    ...
  </operation>
</portType>
```

Example `<binding>` Elements

```
<binding name="SystemBinding" type="tns:SystemPortType">
  <soap:binding style="document" transport="http://schemas.xmlsoap.org/soap/http"/>
  <operation name="ping">
    ...
  </operation>
</binding>
<binding name="CustomerBinding" type="tns:CustomerPortType">
  <soap:binding style="document" transport="http://schemas.xmlsoap.org/soap/http"/>
  <operation name="getOperation1">
    ...
  </operation>
  <operation name="getOperation2">
    ...
  </operation>
```

```

</operation>
<operation name="getOperation3">
  ...
</operation>
<operation name="getOperation4">
  <soap:operation soapAction="urn:customer.service.cm.be/getOperation4"/>
  ...
</operation>
</binding>

```

Example <service> Element

```

<service name="CustomerRefService">
  <port name="SystemPort" binding="tns:SystemBinding">
    <soap:address location="http://.../v4/SystemPort"/>
  </port>
  <port name="CustomerPort" binding="tns:CustomerBinding">
    <soap:address location="http://.../v4/CustomerRefPort"/>
  </port>
</service>

```

There are two options for a workaround to this problem.

Workaround Option 1

You can create two different virtual services. That is, you can expose this native service as two virtual services -- one for each operation that needs to be invoked:

- A service for the `getXXX` operations (for example, a service called `VS_Customer`).
- A service for the `ping` operation (for example, a service called `VS_ping`).

To create a different virtual service for each operation

1. Create a virtual service for the native service `CustomerRefService` and name it `VS_Customer`, for example.
2. Configure `VS_Customer` and configure its routing protocol as "Straight Through".
3. Specify the routing address as `http://... /v4/CustomerRefPort` (for `CustomerBinding`, where all the `getXXX` operations are supported).
4. On the virtual service's **Summary** profile, click on the URL for the WSDL (this a copy of the virtual service template WSDL, very similar to the original native service WSDL) and download/save it to your local file system.

(Make an additional copy of this downloaded WSDL in case you make a mistake in your editing.)

5. Remove the following elements from the WSDL and then save it:
 - `SystemPortType`
 - `SystemBinding`
 - `SystemPort`

Note: Make sure your browser or XML tool can read this modified WSDL without any syntax error.

6. Attach the modified WSDL file to the virtual service by selecting the **Attach WSDL** command in the virtual service's **Actions** menu.
7. Create another virtual service for the native service `CustomerRefService` and name it `VS_ping`, for example. Repeat the above steps but with the following differences:
 - Specify the routing address as `http://... /v4/SystemPort`.
 - Remove the following elements from the WSDL:
 - `CustomerPortType`
 - `CustomerBinding`
 - `CustomerPort`
8. Deploy both virtual services to Mediator.

Workaround Option 2

With this option, you expose the native service as one virtual service. The web service client will access the service through one address to the virtual service for all the possible operations (`ping` and `getXXX`). The virtual service then takes care of routing to the correct endpoint for the different operations. This is accomplished by using "Content-based" routing (instead of "Straight Through" routing) to determine the operation being called (based on the SOAP request content) and then forwarding the request to the correct endpoint.

To create a virtual service with "Content-based" routing

1. Create a virtual service for the native service `CustomerRefService` and name it `VS_CustomerRefService`, for example.
2. Configure `VS_CustomerRefService` and configure its routing protocol as "Content-based".
3. On the **Routing Protocols** tab, construct the routing rule as follows:
 - a. Click the **Endpoint** button (next to the **Route To** column).
 - b. In the **Search for Endpoint** dialog that appears, click the **Search** button to search for the Web service endpoint to route the requests to.
 - c. Select `http://... /v4/SystemPort` (the Accessing URI that goes to ping operation).
 - d. To create an XPath expression for the routing rule, click the **Edit** button (next to the **If True** column).
 - e. In the XPath Editor that appears, click the **All Nodes** tab, expand the namespace's node, click to highlight the `tns:ping` element, and click **OK**

- f. Double check that you have something like this in the rule and it is routed to `SystemPort`:

```
/soapenv:Envelope/soapenv:Body/tns:pingRequest
```

4. Set the **Default To** routing field to the routing address `http://... /v4/ CustomerRefPort` (for `CustomerBinding`, where `getXXX` operations are supported).
5. On the virtual service's **Summary** profile, click on the URL for the WSDL (this a copy of the virtual service template WSDL, very similar to the original native service WSDL) and download/save it to your local file system.

(Make an additional copy of this downloaded WSDL in case you make a mistake in your editing.)

6. Modify the WSDL as follows and then save it:
 - a. Copy the `ping` operation from `SystemPortType` and add into `CustomerPortType`.
 - b. Delete the `SystemPortType`. The objective here is to make *one* port type only.
 - c. Update the `SystemBinding` to also refer to `CustomerPortType`, since `SystemPortType` has been deleted.

Note: The `soapAction` attribute must be specified for the `soap:operation` element to ensure that Mediator can resolve the operation being invoked for this service.

- d. Save the WSDL.

Note: Make sure your browser or XML tool can read this modified WSDL without any syntax error.

7. Attach the modified WSDL file to the virtual service by selecting the **Attach WSDL** command in the virtual service's **Actions** menu.
8. Deploy the virtual service to Mediator.

8 Important Considerations when Configuring REST or XML Virtual Services

■ Introduction	288

■ Changing the HTTP Method of a REST or XML Request	291
■ Working with the JSON Content-Type	296
■ Handling Virtual REST APIs with Multiple Resources	307

Introduction

With Web services, the native service endpoint that is sent by CentraSite to Mediator inside a virtual service definition is a static element. Once the virtual service is successfully deployed to Mediator, the real endpoint is returned to CentraSite as part of the response message during deployment. At run time, when a SOAP request is received, that request is POSTed to the endpoint that is statically defined in the virtual service definition.

However, with REST services or XML services, the endpoint is flexible. The REST services or XML services describe data as resources. The resources are accessible via logical endpoints that have application meaning to users. For example, a collection of textbooks might be defined as a resource with the following URL:

```
http://{host}:{port}/books
```

A specific book with an identifier of 1234 would be accessible with the following URL:

```
http://{host}:{port}/books/1234
```

Due to this difference and others, you should keep the following topics described in this chapter in mind when you configure a REST or XML virtual service.

Endpoint Manipulation of REST or XML Virtual Services

When you configure a virtual REST or XML service, you specify the native service name, an endpoint, and the HTTP method type(s) that are included in the message (POST, GET, PUT, DELETE). From this information, CentraSite will generate a virtual service definition that includes service and operation elements, as well as an endpoint and binding element pair for each HTTP method specified.

CentraSite will automatically generate an operation name to be included when the virtual service definition deployment message is sent to Mediator. This means that if you create a virtual service called VS1, and you specify a native endpoint, then the endpoint exposed by Mediator for calling the virtual service will be /ws/VS1/Invoke.

For example, assume the following endpoints are deployed.

Native service endpoint: `http://localhost:8080/services/mtc/member`

Virtual service endpoint: `http://localhost:5555/ws/VS1/Invoke`

Assume that the example virtual service is deployed with two HTTP method bindings: GET and POST. Both of these bindings have operation elements that include the same HTTP location attribute: member. To better illustrate the functionality, the examples below show a series of sample requests from a consumer including the requests' HTTP method and Content-Type. (At run time, REST message detection is dependent upon a consumer using the correct Content-Type when a request is sent.) Each example shows

the expected endpoint that Mediator will send after it has rewritten the endpoint prior to native service invocation.

Example 1

For a GET, assume that:

The request Content-Type is: application/x-www-form-urlencoded

The endpoint received by Mediator is: http://localhost:5555/ws/VS1/Invoke

The native service endpoint sent by Mediator is: http://localhost:8080/services/mtc/member

The application function is: The native service returns a collection of members with summary information.

Example 2

For a GET, assume that:

The request Content-Type is: application/x-www-form-urlencoded

The endpoint received by Mediator is: http://localhost:5555/ws/VS1/Invoke/1234

The native service endpoint sent by Mediator is: http://localhost:8080/services/mtc/member/1234

The application function is: The native service returns summary data for a member with this key.

Example 3

For a GET, assume that:

The request Content-Type is: application/x-www-form-urlencoded

The endpoint received by Mediator is: http://localhost:5555/ws/VS1/Invoke/1234?detail=true

The native service endpoint sent by Mediator is: http://localhost:8080/services/mtc/member/1234?detail=true

The application function is: Query parameters remain intact. Returns a response message with more member details.

Example 4

For a POST, assume that:

The request Content-Type is: application/xml or application/json

The endpoint received by Mediator is: `http://localhost:5555/ws/VS1/Invoke/1234`

The native service endpoint sent by Mediator is: `http://localhost:8080/services/mtc/member/1234`

The application function is: The request message provides the contents needed to create the member resource.

Example 5

For a GET, assume that:

The request Content-Type is: `application/x-www-form-urlencoded`

The endpoint received by Mediator is: `http://localhost:5555/ws/VS1/Invoke/joe`

The native service endpoint sent by Mediator is: `http://localhost:8080/services/mtc/member/joe`

The application function is: Fetches the member defined with the login joe. (Mediator contains no metadata in its service deployment to differentiate between the "login" vs. "key" GET requests.)

Example 6

For a GET, assume that:

The request Content-Type is: `application/x-www-form-urlencoded`

The endpoint received by Mediator is: `http://localhost:5555/ws/VS1/Invoke?type=login&value=joe`

The native service endpoint sent by Mediator is: `http://localhost:8080/services/mtc/member?type=login&value=joe`

The application function is: The native service might also support a static endpoint with constraints defined in query parameters. Mediator also supports this approach.

The Request Message's HTTP Methods and Content-Types for REST and XML Services

When you configure the Entry Protocol step of a virtual REST or XML service, it is important to specify all the HTTP methods that are supported for the service. For example, if the virtual service is deployed to Mediator and you selected only the GET method in the virtual service's details page, then Mediator will only permit GET invocations. In this case, a POST request will be rejected with a return of statusCode 405 even if the native service happens to support POSTs.

It is important that the client's requests contain an HTTP Content-Type header. At run time, Mediator determines which message builder to use based on the message's HTTP

method and its Content-Type. (The absence of the soapAction header will indicate to Mediator that the message is an XML message.)

The valid HTTP method/Content-Type combinations are as follows:

This method...	Can be included in a message of this Content-Type...
POST	application/xml application/json application/x-www-form-urlencoded multipart/form-data or text/xml
PUT	application/xml application/json application/x-www-form-urlencoded multipart/form-data or text/xml
GET	application/x-www-form-urlencoded
DELETE	application/x-www-form-urlencoded
Note:	<p>Keep the following in mind:</p> <ul style="list-style-type: none"> ■ If Mediator receives a request sent with an HTTP method that is not specified in the virtual REST service or virtual XML service definition, it will return a 405 error. ■ If Mediator receives a request sent with a wrong Content-Type, it will return a 415 error. In addition, if the wrong Content-Type is used with a GET or DELETE, then the query parameters contained in the message (if any) will not be processed.

Changing the HTTP Method of a REST or XML Request

When configuring a REST or XML virtual service, you specify whether to route the requests to the native service with the same HTTP method that is contained in the requests (GET, POST, PUT, DELETE), or whether to route the requests with a different HTTP method.

Typically you want to pass each request to the native service with the same HTTP method that is contained in the request. For example, if a request contains a GET method, you allow the GET method to be passed to the native service. However, there might be rare cases in which you want to change the HTTP method of a request to different HTTP method. For example, you might want to:

- Expose an XML service as a REST service.

In this case, the service you create would be a Virtual XML service that exposes the HTTP methods GET, POST, PUT and DELETE, but the routing method would always be POST.

- Expose a REST service whose virtual REST service only exposes the POST method.

To change the HTTP method of a REST or XML request

- On the REST or XML virtual service, set the value of the HTTP Method field either statically (by explicitly setting the value to **GET**, **POST**, **PUT**, or **DELETE**) or dynamically (by setting the value to **Use Context Variable**).

In order to use the **Use Context Variable** option to set the field dynamically, you must write a webMethods IS service that sets a value of GET, POST, PUT or DELETE for a predefined context variable named ROUTING_METHOD. You need to invoke this service in the virtual service's **Invoke webMethods IS Service** action. For details, see "[Changing HTTP Methods in Requests Dynamically using a Context Variable](#)" on page 294.

Caution: Use this feature carefully, since changing HTTP methods to certain other HTTP methods could result in unintended results or errors.

For example, changing an inbound GET request to a DELETE request would be a serious mistake if the deletion was not intended and the native REST service actually deleted a resource when invoked with a DELETE method. Additionally, an incoming POST or PUT request cannot be translated into a GET or DELETE if the request has nested elements. For more information, see "[The Implications of Changing HTTP Methods](#)" on page 292.

The Implications of Changing HTTP Methods

When changing this incoming HTTP method...	To...	Note that...
GET	POST	<ul style="list-style-type: none"> ■ The Content-Type of the changed request is sent as application/xml or application/json, and the charset is UTF-8. ■ Depending on the structure of the native service, be aware that the native service might not be expecting the same payload structure that is being sent. In this case, you would need to transform the request message into the format required by the native service before Mediator sends the requests to the native service. For more information, see "Sample"

When changing this incoming HTTP method...	To...	Note that...
XSLT Transformation for GET-to-POST or GET-to-PUT" on page 295.		
GET	PUT	Identical to GET-to-POST, except that Mediator changes the request's HTTP method from GET to PUT.
GET	DELETE	No comment.
POST	GET	<ul style="list-style-type: none"> ■ Mediator will translate the POSTed request elements into query string parameters, in a root element. <div style="border: 1px solid #ccc; padding: 5px; margin: 5px 0;"> <p>Note:An incoming POST or PUT request cannot be translated into a GET or DELETE if the request has nested elements. For example:</p> <pre style="margin: 0;">(this is correct) <person> <lastName>Smith</lastName> </person> (this is incorrect) <person> <name> <last>Smith</last> </name> </person></pre> </div> <ul style="list-style-type: none"> ■ If you want to send additional parameters as part of the request URL, you can transform this payload. To do this, you can use an XSLT file or a webMethods IS service call to add parameters before the request is sent to the native service. For more information about adding parameters to REST virtual services, see <i>Working with REST-based APIs in CentraSite</i>.
POST	DELETE	Identical to POST-to-GET, except that Mediator changes the request's HTTP method from POST to DELETE.
POST	PUT	The Content-Type of the changed request is sent as application/xml or application/json, and the charset is UTF-8.

When changing this incoming HTTP method...	To...	Note that...
PUT	GET	Identical to POST-to-GET, except that Mediator changes the request's HTTP method from PUT to GET.
PUT	POST	The Content-Type of the changed request is sent as application/xml or application/json, and the charset is UTF-8.
PUT	DELETE	Identical to POST-to-DELETE, except that Mediator changes the request's HTTP method from PUT to DELETE.
DELETE	GET	No comment.
DELETE	POST	Identical to GET-to-POST, except that Mediator changes the request's HTTP method from DELETE to POST.
DELETE	PUT	Identical to GET-to-PUT, except that Mediator changes the request's HTTP method from DELETE to PUT.
GET, POST, PUT or DELETE	Use Context Variable	See "Changing HTTP Methods in Requests Dynamically using a Context Variable" on page 294.
GET or DELETE	POST or PUT	Note that the query parameters will be picked off the URL and stored as top-level elements when the message is sent to the native service. The query parameters are ignored on the endpoint URL and lost when we POST to the native provider (i.e. don't change the protocol method).

Changing HTTP Methods in Requests Dynamically using a Context Variable

Alternatively, instead of changing an HTTP method explicitly (statically) to PUT, POST, GET or DELETE, you can change the HTTP method to the value of a predefined context

variable (ROUTING_METHOD) that dynamically resolves to a different HTTP method (PUT, POST, GET or DELETE, as appropriate).

To change the HTTP method dynamically, you create a webMethods IS service and invoke it in the virtual service's **Invoke webMethods IS Service** action. This webMethods IS service should reference the predefined context variable ROUTING_METHOD (see "[The Predefined Context Variables](#)" on page 260). To set the value of ROUTING_METHOD, use the setContextVariableValue method, which is defined in the following class:

```
com/softwareag/mediator/api/MediatorRuntimeFacade.java
```

For example:

```
public static final void updateHttpMethod(IData pipeline)
    throws ServiceException {

    String mcKey = "Message Context";

    Object obj = IDataUtil.get(pipeline.getCursor(), mcKey);
    if (obj!=null && obj instanceof
org.apache.axis2.context.MessageContext) {

        MessageContext msgCtx = (MessageContext) obj;

        QName varName =
new QName(MediatorContextVariableType.ROUTING_METHOD.getName());

        MediatorRuntimeFacade.setContextVariableValue(varName, "PUT", msgCtx );
    }
}
```

Sample XSLT Transformation for GET-to-POST or GET-to-PUT

As stated in the above table, depending on the structure of the native service, the native service might not be expecting the same payload structure that is being sent. In this case, you would need to transform the request message into the format required by the native service before Mediator sends the requests to the native service. To do this, you invoke an XSLT file at run time.

Assume that:

- The native service name is "authors".
- The virtual REST service or virtual XML service for "authors" is named "vs-authors" and is made available in Mediator at this endpoint: `http://localhost:5555/ws/vs-authors/Invoke`. The targetNamespace of the virtual REST service or virtual XML service is "`http://example.com/authors`".

Following is a sample XSLT transformation file for the GET-to-POST or GET-to-PUT scenario.

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:ns="http://example.com/authors"
    version="1.0">

    <xsl:output method="xml" omit-xml-declaration="no" standalone="yes"
        indent="yes"/>
```

```

<xsl:strip-space elements="*" />
<xsl:template match="node()|@*">
  <xsl:copy>
    <xsl:apply-templates select="node()|@*" />
  </xsl:copy>
</xsl:template>

<xsl:template match="//ns:invoke/node()">
  <xsl:element name="{local-name(.)}">
    <xsl:value-of select="." />
  </xsl:element>
</xsl:template>

<xsl:template match="//ns:invoke">
  <xsl:element name="authors">
    <xsl:apply-templates />
  </xsl:element>
</xsl:template>
</xsl:stylesheet>

```

Working with the JSON Content-Type

Mediator can accept a REST service request that specifies the Content-Type "application/json" (or "application/json/badgerfish") and the HTTP methods PUT, GET, DELETE and POST.

Assuming that the native service supports both JSON and the HTTP method(s) specified in the request, Mediator can determine the correct service, operation and output format (JSON) to return to the consuming application. There are different ways in which a native service provider can be prompted to return response content. It will vary with the provider. For example, some providers may rely on the Accept transport header to specify the format the consumer wants. Others may use an element in the request or a query parameter on the URL.

However, suppose for example that the native service does not support the HTTP method specified in the request (e.g., POST). As a workaround, you can configure the virtual service so that it "bridges" this difference between the consumer request and the native service. In this case, you can configure the virtual service so that it takes the POST and bridges it into an HTTP GET query, and then returns the service to the consumer in the expected JSON format. To implement this, you set the following predefined context variables in a user-defined webMethods IS service that you can invoke in the virtual service's **Invoke webMethods IS Service** action:

- **MESSAGE_TYPE**: A Content-Type defined in axis2.xml for a message formatter. This value must be a key in the axis2 message formatters list, since it is used to control message serialization. (The valid choices are defined as attributes of the <messageFormatters/> group in the Integration Server's axis2.xml configuration.)
- **BUILDER_TYPE**: A Content-Type defined in axis2.xml for a message builder. This value must be a key in the axis2 message builders list since it is used to control building of native service response messages. (The valid choices are defined as attributes of the <messageBuilders/> group in the Integration Server's axis2.xml configuration.)

This and other "bridging" scenarios are discussed in this section.

How Mediator Determines Which Builder and Formatter Classes to Use (and How You Can Override Them)

Mediator makes these determinations at run time as follows. This table also summarizes how you can override the default determinations.

Run-time Step	Description
Mediator receives the request from the client	It is important that the client's PUT or POST requests contain the HTTP header Content-Type because the Content-Type header determines the message builder Mediator uses to parse the input stream. (GET or DELETE request do not require a Content-Type header.)
Mediator sends the request to the service provider	<p>Mediator uses a message formatter to serialize the request, and then sends the serialized request to the native service provider.</p> <p>Mediator determines the message formatter to use as follows:</p> <ul style="list-style-type: none"> ■ If you explicitly specify a message formatter (by setting the MESSAGE_TYPE context variable in a webMethods IS service and invoking this service in the virtual service's Invoke webMethods IS Service action), then Mediator uses that formatter. The Content-Type header that Mediator sends to the native provider is the one that is associated with the MESSAGE_TYPE context variable. ■ Else, Mediator will use the message formatter associated with the Content-Type sent by the client (and sends the Content-Type to the native provider). ■ Else, if no Content-Type was sent by the client, then: <ul style="list-style-type: none"> ■ For PUT requests, the default formatter used (and the Content-Type header that Mediator sends to the native provider) is <code>application/xml</code>. ■ For POST requests, the default formatter used (and the Content-Type header that Mediator sends to the native provider) is <code>SOAP</code> (and the request will fail). ■ For GET or DELETE requests (which do not require a Content-Type header), the default

Run-time Step	Description
	<p>formatter used (and the Content-Type header that Mediator sends to the native provider) is <code>application/x-www-form-urlencoded</code>.</p>
<p>Mediator receives a response from the service provider</p>	<p>When the provider returns a response to Mediator, a message builder parses the response stream into an Axiom message to be stored in the message context. Mediator determines which message builder to use as follows:</p> <ol style="list-style-type: none"> 1. Mediator will select the message builder associated with the request's Accept transport header, if one was specified. 2. Else, you can set the <code>BUILDER_TYPE</code> context variable in a webMethods IS service, and invoke this service in the virtual service's Invoke webMethods IS Service action. Mediator will check that the builder type is a valid Content-Type for the list of builders in <code>axis2.xml</code>. This variable takes priority over the current setting specified in the Accept transport header. That is, Mediator will only use the Accept header to determine the builder type needed to parse a native provider response if no IS service was written to set the <code>BUILDER_TYPE</code> context variable. 3. Else, Mediator will use the builder associated with the Content-Type specified in the request (assuming that the Content-Type is one of the types that is mapped in <code>axis2.xml</code>). 4. Else, if no Content-Type was specified in the request (e.g., a PUT or POST request with no Content-Type, or any GET or DELETE request), or if the Content-Type is not one of the types that is mapped in <code>axis2.xml</code>, then Mediator will default to <code>application/xml</code>.
<p>Mediator sends a response to the client</p>	<p>Mediator serializes the response and sends it to the client.</p> <p>By default, Mediator uses the formatter that was used to serialize the request sent to the provider. (If the formatter was <code>application/x-www-form-urlencoded</code> (for a GET or DELETE request), then Mediator will instead use <code>application/xml</code> so it can send the response.)</p> <p>You can override the Content-Type that is sent to the client by setting the <code>MESSAGE_TYPE</code> context variable</p>

Run-time Step	Description
	in a webMethods IS service, and invoking this service in the virtual service's Invoke webMethods IS Service action.

Scenarios for Requesting JSON Type Services

Following are some of the possible scenarios in which JSON type services can be requested. Many scenarios require that you "bridge" the differences between consumer requests and the native service (i.e., differing HTTP methods and Content-Types). Three of the scenarios are discussed in more detail following the table.

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging?
GET	GET	JSON	JSON	Request Processing step bridging (see "JSON Example 1: GET Request, JSON Response" on page 301)
POST/JSON	POST/JSON	JSON	JSON	No bridging needed
GET	GET	XML	JSON	Response Processing step bridging
POST/JSON	GET	JSON	JSON	Request Processing step bridging
POST/JSON	GET	XML	JSON	Request Processing step

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging?
				bridging and Response Processing step bridging (see "JSON Example 2: POST/JSON Request, JSON Response (where POST is not supported)" on page 302)
POST/JSON	XSLT/GET *	JSON	JSON	Request Processing step bridging
POST/JSON	XSLT/POST/XML *	XML	XML	Request Processing step bridging
POST/JSON	POST/JSON	JSON/XSLT *	JSON	Response Processing step bridging
GET	GET	JSON	XML	Request Processing step bridging and Response Processing step bridging

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging?
				(see "JSON Example 3: GET Request, XML Response" on page 304)
POST/ XML	POST/JSON	JSON	JSON	Request Processing step bridging

* The XSLT references indicate where you can perform an XSLT message transformation at either the **Request Transformation** or **Response Transformation** action.

In the table above, the required Content-Type settings are not shown, but assume the following:

HTTP Method/Request Content	Required Axis2 Content Type
GET or DELETE	application/x-www-form-urlencoded
POST or PUT/XML	application/xml
POST or PUT/Mapped JSON	application/json
POST or PUT/Badgerfish	application/json/badgerfish

JSON Example 1: GET Request, JSON Response

In this example, a consumer sends a GET request to get a native JSON service. Mediator will send the response to the consumer in the requested JSON format (as indicated by the "output=json" parameter in the query).

The request looks like this:

```
http://localhost:5555/ws/YahooVS/search?query=wsdl20&output=json
```

and because this is a GET request, the Content-Type defaults to application/x-www-form-urlencoded.

Note: For GET or DELETE requests for REST services, it is not necessary to specify the Content-Type in the request; Mediator will default to `application/x-www-form-urlencoded` for GET or DELETE requests.

The run-time processing will be as follows:

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging
GET	GET	JSON	JSON	Request Processing step bridging

Since the request is a GET (i.e., of Content-Type `application/x-www-form-urlencoded`), but Mediator expects to receive a JSON stream from the provider, you must send the `BUILDER_TYPE` `application/json` to the native provider. To do this, write and invoke a webMethods IS service in the virtual service's **Invoke webMethods IS Service** action. The IS service should include the following predefined context variable set to this value:

Context Variable	Value
<code>BUILDER_TYPE</code>	<code>application/json</code>

JSON Example 2: POST/JSON Request, JSON Response (where POST is not supported)

In this example, a consumer sends a POST request (of Content-Type `application/json`) to a native service, but the native service does not support POST.

The request's Content-Type is `application/json` and its output parameter is set to `xml`. The reason for this is explained below.

The run-time processing will be as follows:

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging
POST/JSON	GET	XML	JSON	■ Request Processing

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging
				<ul style="list-style-type: none"> ■ step bridging ■ Response Processing step bridging

Configure the virtual service as follows:

- In the virtual service's Routing Protocols tab, set the value of the HTTP Method field to the value GET. Doing this instructs Mediator to change the POST to an HTTP GET before Mediator sends it to the native service (which is necessary because the native service does not support POST).
- Write and invoke a webMethods IS service in the virtual service's **Invoke webMethods IS Service** action. The IS service should include the following predefined context variables set to the values shown below. The request's "query": "wsdl120" and "output": "xml" parameters are transformed into query parameters on the URL before the native service is invoked. Thus, although the consumer is sending a JSON request, the native service is instructed to return an XML response to Mediator.

Context Variable	Value
MESSAGE_TYPE	application/x-www-form-urlencoded
BUILDER_TYPE	application/xml

- Write and invoke a webMethods IS service in the virtual service's **Invoke webMethods IS Service** action. The IS service should include the following predefined context variable set to the value shown below. Doing this instructs Mediator to bridge the XML response from the native service into JSON format, to be returned to the consumer.

Context Variable	Value
MESSAGE_TYPE	application/json

JSON Example 3: GET Request, XML Response

In this example, a consumer sends a GET request to get a native service. Mediator will send the response to the consumer in the requested XML format (as indicated by the "output=xml" parameter in the query).

The request looks like this:

```
http://localhost:5555/ws/YahooVS/search?query=wsdl20&output=xml
```

and because this is a GET request, the Content-Type defaults to `application/x-www-form-urlencoded`.

The run-time processing will be as follows:

Consumer Sends	Mediator Sends Request to Provider	Mediator Receives Response from Provider	Mediator Sends Response to Consumer	Requirement for Bridging
GET	GET	JSON	XML	<ul style="list-style-type: none"> ■ Request Processing step bridging ■ Response Processing step bridging

Since the request is a GET (i.e., of Content-Type `application/x-www-form-urlencoded`), but Mediator expects to receive a JSON stream from the provider, you must instruct Mediator to send the `BUILDER_TYPE` `application/json` to the native provider. To do this, write and invoke a webMethods IS service in the virtual service's **Invoke webMethods IS Service** action. The IS service should include the following predefined context variable set to this value.

Context Variable	Value
<code>BUILDER_TYPE</code>	<code>application/json</code>

Since the provider will return a JSON stream to Mediator, but the consumer expects to receive the service in XML output format, you must set the `MESSAGE_TYPE` to `application/xml`. To do this, write and invoke a webMethods IS service in the virtual service's **Invoke webMethods IS Service** action. The IS service should include the following predefined context variable set to this value:

Context Variable	Value
MESSAGE_TYPE	application/xml

Characteristics of the Mapped and Badgerfish JSON Conventions

The open source library that Axis2 uses to support JSON is called Jettison. The Jettison library supports two formats of JSON: Mapped JSON and Badgerfish. Both are syntactically correct from a JSON perspective.

Note: An important difference between the two is that the Mapped convention returns a service fault if a virtual service is configured for application/json (Mapped convention) and it encounters a message that has namespaces, while the Badgerfish convention attempts to avoid losing any meaning encoded in XML by preserving namespace declarations. The Axis2 JSON library MessageFormatter will complain if Mediator attempts to transform an XML response that contains namespace declarations. So, either make sure that the requests do not include namespaces, or else set the MESSAGE_TYPE to application/json/badgerfish instead of setting it to application/json.

Other characteristics include the following.

Mapped JSON Convention

1. An element with no characters or child elements is represented by:

```
{ "element" : "" }
```

2. No namespaces declarations are ever written.

Note: The Badgerfish convention does allow namespaces. If a client sends a request that contains XML namespaces, you need to bridge to the Badgerfish convention. To do this, in the virtual service's **Set Headers** action, set the parameter **Set Headers** to **Header** and specify the Name as Content-Type and the Value as application/json/badgerfish. Doing this will override the existing Content-Type that will be sent to the native provider.

3. An element with multiple child elements of the same name is represented by an array.

Simple case:

```
<price>10.00</price>
{ "acme.price" : { "10.00" } }
```

Array case:

```
<root><child>test</child><child>test</child></root>
{ "root" : { "child" : [ "test", "test" ] } }
```

4. The XML attributes for a message are prefixed with @ when a message is serialized (same as Badgerfish).

Badgerfish Convention

This convention is used to provide the means to translate between XML and JSON without losing any data (i.e., namespaces).

1. Element names become object properties.
2. Text content of elements goes in the \$ property of an object.
3. Nested elements become nested properties.
4. Multiple elements at the same level become array elements.
5. Attributes go in properties whose names begin with @.
6. Active namespaces for an element go in the element's @xmlns property.
7. The default namespace URI goes in @xmlns.\$.
8. Other namespaces go in other properties of @xmlns.
9. Elements with namespace prefixes become object properties, too.

Simple example:

```
<price xmlns="http://acme.com">10.00</price>
{ "price": { "@xmlns": { "$": "http://acme.com" }, "$1": "10.00" } }
```

A more complex example:

```
<alice xmlns="http://some-namespace"
      xmlns:charlie="http://another-namespace">
  <bob>david</bob>
  <charlie:edgar>frank</charlie:edgar>
</alice>

{ "alice" : { "bob" : { "$" : "david" , "@xmlns" :
{"charlie" : "http://another-namespace" , "$" : "http://some-namespace" } } ,
  "charlie:edgar" : { "$" : "frank" , "@xmlns" :
{"charlie":"http://another-namespace", "$" : "http://some-namespace" } },
"@xmlns" : { "charlie" : "http://another-namespace", "$" : "http://some-namespace" } } }
```

Multiple Root Nodes in JSON REST Services

With REST virtual services, when working with requests and responses of the Content-Type application/json, the message content can contain one or more root nodes.

For example, a message might have the two root nodes {"firstName": "John", "lastName": "Smith"}. Note the following points for messages with multiple root nodes.

- The XSLT provided in the Request/Response Processing step should have the XPath start with //, for example //firstName. This is because during the processing of the JSON content, Mediator will wrap the given content with system-defined elements.

- webMethods IS services that you invoke in the Request/Response Processing step will contain the JSON content in the variable called `JSONRESTContentString`. You can update the content in the IS service and put the updated content into the pipeline's input variable `UpdatedJSONRESTContentString`, which will be sent to the native service.

With REST virtual APIs, if you have the XSLT or webMethods IS services defined in the Request/Response Handling actions, then you must have the method name prefixed to the resource name in order to reference to that particular resource. For example, if you have the resource name `phones` defined with a `GET` method, you would reference it as `GET_phones`.

Handling Virtual REST APIs with Multiple Resources

The enhanced REST framework of CentraSite Business UI allows you to explicitly define multiple resources for a RESTful API. Each resource within the API exposes a unique URI for performing the CRUD operations on the resource.

CentraSite provides the resource path tokenizer to support the multiple resources handling at run-time. The tokenizer for substituting a resource path is automatically appended to the API's endpoint (base URL) by a path variable `${sys:resource_path}`. When there are multiple resources defined for an API, at run time, Mediator replaces the resource path tokenizer with the appropriate resource path that is defined for the particular resource call.

Important: Beginning with version 9.7, CentraSite supports the multi-resource handling of the REST interface at run-time (in contrast, earlier versions of CentraSite supported a single resource handling). Note that the enhanced REST interface that is implemented by current version of CentraSite is not compatible with the interface that was implemented by previous versions of Mediator prior to version 9.7. However, if you still attempt to publish a virtual REST API with multiple resources to an earlier version of Mediator instance, Mediator throws an exception message.

Let's now learn about the usage of resource path tokenizers in CentraSite by looking at a couple of examples using our sample phone store API.

Consider you have a plain REST API `PhoneStoreAPI` with a defined set of resources for performing the CRUD operations.

Assume you have the PhoneStore API with the following configuration details:

- Base URL:

```
http://www.phonestore.com/api
```

- Resource:

```
phones
```

- Resource URI:

```
/phones
```

■ Native Endpoint:

```
http://www.phonestore.com/api/phones
```

Beginning with version 9.7, on a virtual copy of this API, CentraSite appends the resource path tokenizer `${sys:resource_path}` to represent its Route to endpoint like this:

```
http://www.phonestore.com/api/${sys:resource_path}
```

In the aspect of this resource path tokenizer, there are two principal scenarios, when consumers attempt to model virtual REST APIs with multiple resources.

Scenario A

Consider you have a virtual REST API created using the current version of CentraSite, this API will have the Route to endpoint of the Straight-Through/Content-Based/Content-Based Routing action, by default, appended with a resource path tokenizer. The Route to endpoint assigned by CentraSite has the format `<base-url>/${sys:resource_path}`, where the `resource_path` is the same as the original resource URI defined in the API's first resource definition.

Whenever you try to add a new resource to this API, the endpoint is automatically assigned and sent to Mediator for processing inside a Virtual Service Definition (VSD) in the prescribed format. At run time, when a HTTP request is received for the resource, that request will be sent to the endpoint dynamically substituted with the path variable. This dynamic substitution of the endpoint indicates that the REST interface is enhanced to support multiple resources.

Scenario B

Consider you have a virtual REST API created in versions of CentraSite prior to 9.7, this API will continue to exhibit the old REST behavior, that is, it will continue to send the HTTP requests to the native API endpoint using the resource URI defined in the earlier version.

Now consider our sample PhoneStore API with two different formats of resource URIs, say, `/phones`, `/invoke`

Now, whenever you try to add a new resource to this API, CentraSite performs an internal validation of the existing resource URI. Depending on the validation, CentraSite handles the HTTP request in the following way:

- **Endpoint exactly ends with the existing resource URI** - Resource URI `/phones`. In this case, the URI is automatically substituted with the tokenizer. This ensures that the Mediator processes the HTTP request and routes the request to the appropriate native API endpoint for the requested resource.
- **Endpoint does not exactly end with the existing resource URI** - Resource URI `/invoke`. In this case, the URI is not substituted with the tokenizer and eventually results in a failure alert.

Now, based on the routing configuration for the native API, you have the following workaround options:

Straight-Through Routing Action

Given the straight-through routing action, you have two options:

Workaround Option 1:

Modify the Straight-Through routing action of the native REST API.

To modify the Straight-Through routing action

1. In CentraSite Business UI, display the details page for the native REST API. If you need procedures for this step, see *Working with REST-based APIs in CentraSite*.
2. In the action bar for the API, click **Virtualize**.
3. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, select the virtual alias and its endpoint for reconfiguration.
4. Click **Next**.
5. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, locate the “Straight-Through” routing action in the Message Flow section.
6. Mouse hover the action name, and click the **Configure** icon to the right of the name. This opens the **Straight-Through Routing** dialog box.
7. In the **Route to** endpoint field, modify the existing endpoint. Append the resource path tokenizer `${sys:resource_path}` with the base URL in the format `<base-url>/${sys:resource_path}`.

Thus, for our sample endpoint:

```
http://www.phonestore.com/api/phones
```

The modified endpoint should be:

```
http://www.phonestore.com/api/${sys:resource_path}
```

8. Click **OK** and save the modified API.
9. If you choose to use this option, in addition to the above steps in CentraSite Business UI, you must consider the following:
 - Modify the native service implementation to reconfigure the endpoint and resource URI.
 - -OR-
 - In the details page of the native REST API, edit the resource URI to exactly match with the endpoint. Thus for our example, modify the resource URI to read `/phones`. In addition, you must inform the clients of changes that have been made to the endpoint and resource URI.

Workaround Option 2:

Convert the Straight-Through Routing action of the native REST API to either a Context-Based Routing or Content-Based Routing action.

To convert the Straight-Through routing action

1. In CentraSite Business UI, display the details page for the native REST API. If you need procedures for this step, see *Working with REST-based APIs in CentraSite*.
2. In the action bar for the API, click **Virtualize**.
3. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, select the virtual alias and its endpoint for reconfiguration.
4. Click **Next**.
5. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, locate the “Straight-Through” routing action in the Message Flow section.
6. Mouse hover the action name, and click the **Delete** icon to the right of the name.
7. Drag and drop the Content-Based Routing action or the Context-Based Routing action from the Policy Actions accordion to the Message Flow section.
8. Configure the Content-Based Routing action or the Context-Based Routing action as described in the subsequent sections.

Content-Based Routing Action

Given the Content-Based Routing action, specify a custom routing rule. Perform the following steps:

1. In CentraSite Business UI, display the details page for the native REST API. If you need procedures for this step, see *Working with REST-based APIs in CentraSite*.
2. In the action bar for the API, click **Virtualize**.
3. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, select the virtual alias and its endpoint for reconfiguration.
4. Click **Next**.
5. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, locate the “Content-Based” routing action in the Message Flow section.
6. Mouse hover the action name, and click the **Configure** icon to the right of the name. This opens the **Content-Based Routing** dialog box.
7. In the **Default Route to** endpoint field, modify the existing endpoint. Append the resource path tokenizer `${sys:resource_path}` with the base URL in the format `<base-url>/${sys:resource_path}`.

Thus, for our sample endpoint:

```
http://www.phonestore.com/api/phones
```

The modified endpoint should be:

```
http://www.phonestore.com/api/${sys:resource_path}
```

8. Click the **Add Routing Rule** button. In the **Routing Rule** dialog box, complete the following fields:
 - a. In the **XPath Expression** field, specify an XPath expression unique to the resource.
 - b. Add a namespace value in the **Prefix** and **URI** fields.
 - c. In the **Route To** field, specify the native API endpoint.

In our sample,

```
http://www.phonestore.com/api/phones
```

- d. Click **OK** to save the new routing rule.
9. Click **OK** and save the modified API.

Context-Based Routing Action

Given the Context-Based Routing action, specify a custom routing rule. Perform the following steps:

1. In CentraSite Business UI, display the details page for the native REST API. If you need procedures for this step, see *Working with REST-based APIs in CentraSite*.
2. In the action bar for the API, click **Virtualize**.
3. In the **Virtualize <API_Name> (Step 1 of 3)** wizard, select the virtual alias and its endpoint for reconfiguration.
4. Click **Next**.
5. In the **Virtualize <API_Name> (Step 2 of 3)** wizard, locate the “Context-Based” routing action in the Message Flow section.
6. Mouse hover the action name, and click the **Configure** icon to the right of the name. This opens the **Context-Based Routing** dialog box.
7. In the **Default Route to** endpoint field, modify the existing endpoint. Append the resource path tokenizer `${sys:resource_path}` with the base URL in the format `<base-url>/${sys:resource_path}`.

Thus, for our sample endpoint:

```
http://www.phonestore.com/api/phones
```

The modified endpoint should be:

```
http://www.phonestore.com/api/${sys:resource_path}
```

8. Click the **Add Routing Rule** button.
 - a. Enter a name for the new routing rule.
 - b. For the **Variable** field, select **Predefined Context Variable** from the drop-down list.

- c. In the **Condition** section of the dialog box, take the following steps.
 - a. Select `String` in the first **Data Type** field.
 - b. Select the `Virtual Service Operation` in the second **Predefined Context** field.
 - c. Specify the `Equal To` operator in the third field.
 - d. Specify the exact resource name in the **Variable Value** field. In our example, `invoke`.
 - e. In the **Route To** field, specify the native API endpoint.
In our sample,
`http://www.phonestore.com/api/phones`
 - f. Click **OK** to save the new routing rule.
9. Click **OK** and save the modified API.

9 Run-Time Governance Reference

■ Run-Time Events and Key Performance Indicator (KPI) Metrics	314
■ Built-In Run-Time Actions Reference for Virtual Services	333
■ Built-In Run-Time Actions Reference for APIs	368
■ Computed Runtime Actions	457

Run-Time Events and Key Performance Indicator (KPI) Metrics

CentraSite can receive run-time events and Key Performance Indicator (KPI) metrics. A run-time event is an event that occurs while services are actively deployed on the gateway. Examples of run-time events include:

- Successful or unsuccessful SOAP requests/responses.
- Policy violation events, which are generated upon violation of service's run-time policy.
- Service monitoring events, which are generated by the service-monitoring actions in the run-time policy.

KPI metrics are used to monitor the run-time execution of virtual services. Metrics include the maximum response time, average response time, fault count, availability of virtual services, and more. If you include run-time monitoring actions in your run-time policies, the actions will monitor the KPI metrics for virtual services, and can send alerts to various destinations when user-specified performance conditions for a service are violated.

CentraSite provides predefined event types for use with any supported policy-enforcement point (PEP), such as webMethods Mediator. In addition, you can create custom event types.

The run-time event data are collected by the PEP and published to CentraSite via SNMP. The PEP publishes data for all run-time events for all instances of the PEP gateway.

You can view the run-time events and metrics on the CentraSite Control user interface. You can view them for all targets, for a particular target, or for a particular virtual service.

The Run-Time Event Types

The types of run-time events that Mediator can publish are as follows:

Event Type	Description
Lifecycle	A Lifecycle event occurs each time Mediator is started or shut down.
Error	An Error event occurs each time an invocation of a virtual service results in an error.

Event Type	Description
Policy Violation	A Policy Violation event occurs each time an invocation of a virtual service violates a run-time policy that was set for the virtual service.
Transaction	A Transaction event occurs each time a virtual service is invoked (successfully or unsuccessfully).
Monitoring	Mediator publishes key performance indicator (KPI) metrics, such as the average response time, fault count, and availability of all virtual services (described below).

The Key Performance Indicator (KPI) Metrics

For the Monitoring event type, Mediator can publish the following types of KPI metrics:

Metric	Reports on...
Availability	The percentage of time that a virtual service was available during the current interval. A value of 100 indicates that the service was always available. Only the time when the service is unavailable counts against this metric. If invocations fail due to policy violations, this parameter could still be as high as 100.
Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. This is measured from the moment Mediator receives the request until the moment it returns the response to the caller.
Fault Count	The number of failed invocations in the current interval.
Maximum Response Time	The maximum amount of time it took the service to complete an invocation in the current interval.
Minimum Response Time	The minimum amount of time it took the service to complete an invocation in the current interval.
Successful Request Count	The number of successful service invocations in the current interval.

Metric	Reports on...
Total Request Count	The total number of requests for each service running in Mediator in the current interval.
Note:	By default, Average Response Time, Minimum Response Time and Maximum Response Time do not include metrics for failed invocations. You can include metrics for failed invocations by setting the <code>pg.PgMetricsFormatter.includeFaults</code> parameter to true. For more information about advanced settings, see <i>Administering webMethods Mediator</i> .

The Event Notification Destinations

Mediator can publish data about the run-time events and metrics to the following destinations:

- An SNMP server. You can use one or both of the following kinds of servers:
 - CentraSite's SNMP server, which uses SNMPv3 user-security model.
For the procedure to configure Mediator to send SNMP traps to the CentraSite SNMP server, see *Administering webMethods Mediator*.
 - A third-party SNMP server, which uses either the SNMPv1 community-based security model or the SNMPv3 user-based security model.
For the procedure to configure Mediator to send SNMP traps to a third-party SNMP server, see *Administering webMethods Mediator*.
- An EDA destination. Mediator can use EDA to publish run-time events and metrics to a database. Mediator uses a JDBC connection pool that you need to define in the Integration Server.
For the procedure to configure Mediator to send this data to an EDA destination, see *Administering webMethods Mediator*.

Destinations for the Monitoring and Transaction Events

For the Monitoring and Transaction event types, there are additional event notification destinations to choose from (in addition to the EDA and SNMP destinations).

Monitoring events are generated by the following run-time actions that you can configure for your virtual services in CentraSite:

- Monitor Service Performance.
- Monitor Service Level Agreement.
- Throttling Traffic Optimization.

Transaction events are generated by the run-time action Log Invocations.

The available destinations for Monitoring and Transaction events are:

- An EDA destination (a database).
- The CentraSite SNMP server or a third-party SNMP server.
- The virtual service's Events profile in CentraSite.
- An SMTP email server.
- Your Integration Server's local log.
- Your Integration Server's audit log (for Transaction events only).

You will select these destinations when you configure your virtual services in CentraSite.

These additional destinations for the monitoring and transaction events are described below.

- ["SMTP Email Servers" on page 317](#)
- ["The Integration Server's Local Log" on page 317](#)
- ["The Integration Server's Audit Log" on page 318](#)

SMTP Email Servers

To specify an SMTP email destination, you must:

- Select the "Email" option as a destination when you configure the run-time actions listed above.
- Set the "Email Configuration" parameters in Integration Server Administrator (go to **Solutions > Mediator > Administration > Email**) as described in *Administering webMethods Mediator*.

The Integration Server's Local Log

To specify the Integration Server's local log as a destination, you must:

- Select the "Local Log" option as a destination when you configure the run-time actions listed above. When configuring the actions, you must also specify the severity of the messages to be logged (the logging level).
- Set the Integration Server Administrator's logging level for Mediator to match the logging levels specified for the run-time actions (go to **Settings > Logging > Server Logger**). For example, if a "Log Invocation" action is set to the logging level of Error, you must also set Integration Server Administrator's logging level for Mediator to Error. If the action's logging level is set to a low level (Warning-level or Information-level), but Integration Server Administrator's logging level for Mediator is set to a higher level (Error-level), then only the higher-level messages are written to the log file.

Entries posted to the local log are identified by a product code of MED.

The Integration Server's Audit Log

You can select the Integration Server Audit Log as a destination for the “Log Invocation” action only. If you expect a high volume of invocations in your system, it is recommended that you select the Audit Log destination. For more information, see *webMethods Audit Logging Guide*.

The Metrics Tracking Interval

Mediator tracks performance metrics by intervals. The interval is a period of time you set in Mediator, during which metrics are collected for reporting to CentraSite. You set the interval in the Publish Interval field on the **Mediator > Administration > CentraSite Communication** page in the Integration Server Administrator. For details, see *Administering webMethods Mediator*.

Mediator only tracks metrics for the current interval. At the end of the interval, Mediator aggregates the metrics and reports them to CentraSite. Once the metrics are reported, Mediator resets its counters for the new interval. Mediator does not calculate and aggregate metrics across intervals. If Mediator is shut down or the virtual service is undeployed before the current interval expires, the performance data is discarded.

Note: To avoid the need for Mediator to store metrics during periods of inactivity, Mediator stores only first and last zero value metrics that occurs during an interval, and discards the remaining consecutive zero value metrics. Doing this drastically reduces the storage space consumed by the metrics, and speeds the queries you perform in the dashboard. Skipping the in-between zero metrics will not affect in the performance graphs shown in the dashboard.

For more information about the metrics tracking interval, see *Administering webMethods Mediator*.

Configuring CentraSite to Receive Run-Time Events and Metrics

Prerequisites:

- Ensure that Mediator is configured for publishing events to an SNMP server, as described in *Administering webMethods Mediator*.
- If you use a target type other than Mediator or webMethods Insight, be sure to configure CentraSite to publish events by providing your own MIB file in your target type's definition file, as described in ["Run-Time Gateways" on page 21](#). (CentraSite provides a MIB file for Mediator and Insight.)
- Optionally change CentraSite's default settings for logging run-time events, as described in the *CentraSite Administrator's Guide*. By default, CentraSite logs all predefined event types, but you may disable any type.

CentraSite provides an Event Receiver, which is a data collector that collects the run-time event data. The Event Receiver listens for run-time events from the target instances via the SNMP (Application-Layer) protocol, and contains the logic to parse and store event data in the Event Receiver's data store.

The following sections describe how to configure the Event Receiver's properties file:

- ["Components of the Event Receiver" on page 319](#)
- ["Configuring the Event Receiver" on page 320](#)
- ["Event Type Modeling" on page 325](#)
- ["Event Modeling" on page 328](#)

Components of the Event Receiver

The Event Receiver contains the following components.

■ The SNMP Listener

CentraSite's SNMPv3 Trap Listener, which supports SNMP4J. This Listener starts automatically when CentraSite starts.

■ The Intermediate Queue

The queue from the SNMP Listener to the Event Processor. This queue decouples the SNMP Listener threads from the Event Processor to improve throughput. The following modes are supported.

- **FileSystem:** Incoming Traps will be stored temporarily in the file system
- **InMemory:** Incoming Traps will be stored temporarily in memory
- **NoQueue:** Incoming Traps will not be stored in any intermediate queue; the SNMP Listener threads will be processed.

To select the mode, set the `eventsQueueImpl` property as described in ["Setting the Events Queue Implementation Property" on page 323](#).

■ The Event Processor

The Event Processor (`SOALinkSNMPEventsListener`) transforms incoming SNMPv3 Traps into an XML file (`Events.xml`) that complies with the schema in the `RuntimeEvents` Collection component. The Event Processor transforms an SNMPv3 Trap to the `Events.xml` file as follows:

1. Determines the Event Type (and Target Type) to which the Trap belongs, and gets the corresponding UUIDs. This involves searching all Event Type-to-Trap mappings in all the defined target types, using the Trap's OID. Since this is an expensive search, the Event Type-to-Trap mapping is cached to improve performance.
2. Parses the Trap attributes and obtains: the Service (UUID); the Target (Name); the TimeStamp and the SessionId. The Processor then searches the registry/

repository and obtains the corresponding UUID for the Target Name. This mapping is also cached to improve performance.

3. Collects the remaining attributes from the Trap.
4. Constructs the Events.xml file using the Event Type UUID, Target Type UUID, Service UUID, Target UUID, TimeStamp, SessionId and other collected attributes.

■ **The Batch Condition**

The Batch Condition is a set of OR conditions used by the Event Processor. The Event Processor supports two modes of event storage into CentraSite: BatchMode and NoBatchMode. BatchMode is available only for FileSystem and InMemory queues. When BatchMode is enabled, the Event Processor continues to accumulate Events.xml documents until one of the conditions is evaluated as true. Then it inserts all the documents as a single batch into CentraSite.

To specify BatchMode or NoBatchMode, set the batch-related properties as described in ["Setting the Properties for FileSystem or InMemory" on page 324](#).

■ **The RuntimeEvents Collection**

The run-time events are stored in the RuntimeEvents Collection as non-registry objects. For information about how events are stored, see ["Event Type Modeling" on page 325](#).

Configuring the Event Receiver

The Event Receiver is bundled in the installation as a Web-Application named SOALinkSNMPEventsListener supporting the JavaEE standard. The configuration file for the Event Receiver is located here:

```
<CentraSiteInstallDir> /cast/cswebapps/SOALinkSNMPEventsListener/WEB-INF/web.xml
```

The web.xml configuration file contains all the Event Receiver configuration properties. You must set these properties as described below, and then restart CentraSite.

- ["Setting the Database Configuration Properties" on page 320](#)
- ["Setting the SNMPv3 Transport Configuration Properties" on page 321](#)
- ["Setting the SNMPv3 USM Configuration Properties" on page 322](#)
- ["Setting the Events Queue Implementation Property" on page 323](#)
- ["Setting the Properties for FileSystem or InMemory" on page 324](#)

Setting the Database Configuration Properties

In the Event Receiver's configuration file, set the following properties related to the RuntimeEvents Collection database.

Database Property and Description

com.softwareag.centrasite.soalink.events.dbUrl

The URL of the RuntimeEvents Collection database. All run-time events will be persisted to this database.

com.softwareag.centrasite.soalink.events.dbUserId

The user name that the Events Listener will use for authentication before persisting event data to the RuntimeEvents Collection database. The default value of this property is the predefined user EventsUser.

Optionally, you can change the value EventsUser to any login user who has the following privileges:

- Write access on the Tamino collection "RuntimeEvents".
- Read access on "TargetTypes", "Targets", "RuntimeEventTypes" and "LogUnit", which are under the Tamino collection "CentraSite".

If you want to change the value to a login user, enter that login user's name in the form `<hostName>\<userName>`.

Important: The predefined password of EventsUser is EventsManager4CS (there is no need to specify the password in this file). If you want to change this password, or if you have changed the value EventsUser to a login user, *you must change the password*. For details about users, groups, roles, and permissions, see *Getting Started with CentraSite*. Whenever you change the password, you must restart CentraSite.

com.softwareag.centrasite.soalink.events.dbNonActivityTimeOut

The non-activity timeout in seconds for the RuntimeEvents Collection database (default 2592000 seconds (i.e., 30 days)).

Setting the SNMPv3 Transport Configuration Properties

In the Event Receiver's configuration file, set the following properties related to a SNMPv3 Transport.

SNMPv3 Transport Property and Description

com.softwareag.centrasite.soalink.events.snmp.transport

Wire transport protocol that will be used by the SNMP Listener. Supported values are: TCP and UDP.

com.softwareag.centrasite.soalink.events.snmp.host

SNMPv3 Transport Property and Description

The CentraSite host name or IP address to which the SNMP listener will bind.

com.softwareag.centrasite.soalink.events.snmp.port

The port to which the SNMP listener will bind. The default is 8181. If Microsoft Internet Information Services (IIS) is installed (or will be installed) on the same machine hosting Integration Server/Mediator, then you may want to change the default SNMP port of 8181 to something else, to avoid any potential runtime conflicts when sending SNMP packets.

com.softwareag.centrasite.soalink.events.snmp.maxInboundMessageSizeInBytes

Maximum inbound message size in bytes (an integer). Traps that exceed this size limit will be rejected. Default value is 256Kb.

com.softwareag.centrasite.soalink.events.snmp.dispatcherPoolSize

The SNMP Listener's Worker-Thread pool size (default is 10). This determines the throughput of the Listener.

Setting the SNMPv3 USM Configuration Properties

In the Event Receiver's configuration file, set the following properties related to SNMPv3 USM.

SNMPv3 USM Property and Description

com.softwareag.centrasite.soalink.events.snmp.engineId

EngineId to be used by the SNMP Listener. If the parameter is left blank, the SNMP Listener will auto-generate the engineId.

com.softwareag.centrasite.soalink.events.snmp.securityName

The SecurityName to be used by the SNMP Listener.

com.softwareag.centrasite.soalink.events.snmp.securityLevel

The Maximum SecurityLevel to be supported by SNMP Listener. Supported values in order are: NOAUTH_NOPRIV, AUTH_NOPRIV and AUTH_PRIV. For example, AUTH_PRIV provides the highest level of security but also supports the other two levels. Similarly AUTH_NOPRIV supports NOAUTH_NOPRIV.

com.softwareag.centrasite.soalink.events.snmp.authProtocol

SNMPv3 USM Property and Description

AuthorizationProtocol to be used by the SNMP Listener for decoding the incoming trap. Supported values are: MD5 and SHA.

com.softwareag.centrasite.soalink.events.snmp.authPassPhraseKey

The PassPhrase key to be used by the AuthorizationProtocol. The passphrase key length should be ≥ 8 . The key is stored in this file; the passphrase value is stored securely in passman.

Note: The value should be the same as the authPassphrasKey that you have set in the `web.xml` file. You can also use the `CentraSiteCommand.cmd` tool to reset this key at a later stage as required.

com.softwareag.centrasite.soalink.events.snmp.privProtocol

The PrivacyProtocol to be used by the SNMP Listener for decoding the incoming trap. Supported values are: DES, AES128, AES, AES192, AES256, 3DES and DESEDE.

com.softwareag.centrasite.soalink.events.snmp.privPassPhraseKey

The PassPhrase key to be used by the PrivacyProtocol. The passphrase length should be ≥ 8 . The key is stored in this file; the passphrase value is stored securely in passman.

Note: The value should be the same as the privPassphrasKey that you have set in the `web.xml` file. You can also use the `CentraSiteCommand.cmd` tool to reset this key at a later stage as required.

Setting the Events Queue Implementation Property

In the Event Receiver's configuration file, set the following property related to the implementation of the events queue.

Events Queue Property and Description

com.softwareag.centrasite.soalink.events.eventsQueueImpl

Supported values are:

- **FileSystem:** Incoming Traps will be stored temporarily in the file system
- **InMemory:** Incoming Traps will be stored temporarily in memory
- **NoQueue:** Incoming Traps will not be stored in any intermediate queue; the SNMP Listener threads will be processed one by one

Events Queue Property and Description

Additional, related properties are described in ["Setting the Properties for FileSystem or InMemory"](#) on page 324.

Setting the Properties for FileSystem or InMemory

When the `eventsQueueImpl` property is set to either `FileSystem` or `InMemory`, you should also set the following properties.

Property for FileSystem or InMemory and Description

`com.softwareag.centrasite.soalink.events.enableBatchInsertion`

Enable or disable batch insertion of events into the database. Supported values are `true` and `false`. If `true`, events will be batched as per the "batching rules" properties below, and the batch will be stored to the database. If `false`, events will be stored to the database one by one.

`com.softwareag.centrasite.soalink.events.maxNumOfEventsPerBatch`

Maximum number of events in a batch. Should be an integer value. A value ≤ 0 disables this rule. This rule is evaluated only on arrival of a new Trap.

`com.softwareag.centrasite.soalink.events.maxSizeOfBatch`

Maximum size (in bytes) of a batch. Default value is 512KB. Should be an integer value. A value ≤ 0 disables this rule. This rule is evaluated only on arrival of a new Trap.

`com.softwareag.centrasite.soalink.events.maxTimeIntervalBetweenBatches`

Maximum time interval (in milliseconds) between two subsequent batch storages. Should be an integer value. A value ≤ 0 disables this rule. Unlike the other two rules, this rule is evaluated periodically. Hence this rule prevents any trap stuck in the batch for ever if inflow of traps stops; in short this acts as a batch-timeout. A very low value for this rule reduces batch efficiency and introduces unnecessary looping.

`com.softwareag.centrasite.soalink.events.fileSystemQueueDir`

(Only applies when the `eventsQueueImpl` property is set to `FileSystem`.) The directory that should be used as `FileSystem Queue`. Incoming traps will be stored in this directory temporarily and hence should have write permission. The path can be absolute or relative. It is advisable to provide the absolute path. Relative paths will be considered relative to one of the following, based on availability in the same order:

Property for FileSystem or InMemory and Description

1. SOALinkSNMPEventsListener/WEB-INF directory for exploded deployments.
2. javax.servlet.context.tempdir for zipped deployments.
3. java.io.tmpdir if none of the above are available.

Event Type Modeling

Event types are modeled as registry objects. The String, Date, Integer and Boolean event attributes are stored in the registry/repository as slots. The File-Type attributes (representing payloads/binary-data) are stored as HasExternalLink associations.

For example, consider the predefined event type Transaction. If you go to the **Target Type** details page, you will see the Transaction event type attributes (which are obtained from the webMethodsESB.mib file) as follows:

Attribute Name	Object ID	Type
Service	1.3.6.1.4.1.1783.201.1.1.1	String
Target	1.3.6.1.4.1.1783.201.1.1.2	String
Timestamp	1.3.6.1.4.1.1783.201.1.1.3	Date
Consumer	1.3.6.1.4.1.1783.201.1.1.4	String
RequestStatus	1.3.6.1.4.1.1783.201.1.1.5	String
ResponsePayload	1.3.6.1.4.1.1783.201.1.1.6	File
RequestPayload	1.3.6.1.4.1.1783.201.1.1.7	File
ProviderRoundTripTime	1.3.6.1.4.1.1783.201.1.1.8	Integer
TotalRoundTripTime	1.3.6.1.4.1.1783.201.1.1.9	Integer
SessionID	1.3.6.1.4.1.1783.201.1.1.16	String
ConsumerIP	1.3.6.1.4.1.1783.201.1.1.17	String
OperationName	1.3.6.1.4.1.1783.201.1.1.21	String

Attribute Name	Object ID	Type
NativeEndpoint	1.3.6.1.4.1.1783.201.1.1.22	String

All of these attributes (except the File-Type attributes RequestPayload and ResponsePayload) are stored as registry object slots, as follows:

Slot Key	Slot Type	Slot Value (Attribute)
uddi_16d34470-9a92-11dd-9b43-e319c2a6593c	xs:string	Service
uddi_f18b5a40-9a91-11dd-b95e-b4758b17b88b	xs:string	Target
uddi_c798d3c0-9a91-11dd-889e-b999c87ba6b7	xs:datetime	TimeStamp
uddi_a7476ff0-a108-11dd-9c38-d8fd010529cc	xs:string	Consumer
uddi_a7476ff0-a108-11dd-9c38-eac6d60fc855	xs:string	RequestStatus
uddi_a7476ff0-a108-11dd-9c38-f3f84c6111f0	xs:integer	ProviderRoundTrip Time
uddi_a7476ff0-a108-11dd-9c38-d02170b3aae3	xs:integer	TotalRoundTripTime
uddi_21b67010-9a92-11dd-926a-991c4c180c79	xs:string	SessionID
uddi_a7476ff0-a108-11dd-9c38-d34f346cb3d5	xs:string	ConsumerIP
uddi_f1c8a185-4b18-4974-a360-6c70756a174a	xs:string	OperationName
uddi_524d05f5-d526-4605-b594-ace1cb750d33	xs:string	NativeEndpoint

The File-Type attributes ResponsePayload and RequestPayload are stored as HasExternalLink associations, as follows:

Association Key	Association Name (Attribute)
uddi:a747704b-a108-11dd-9c38-fde9d932116a	ResponsePayload

Association Key	Association Name (Attribute)
uddi:a745265b-a108-11dd-9c38-bf43eee17363	RequestPayload

The “Target Type to Event Type Association” Object

A target type (represented as a concept) is associated with an event type (represented as a registry object) by a “Target Type to Event Type Association” object, which defines the “UUID to MIB OID” mapping.

The following table shows the contents of a sample object that associates the target type webMethods Mediator with the event type Transaction. The table's columns are described below.

- **Attribute:** The Attribute column is not part of the object; it is included here simply for your reference.
- **Slot Key:** Contains the UUID, which is obtained from the event type registry object.
- **Slot Type:** Contains the slot type, which is obtained from the event type registry object.
- **Slot Value:** Contains the event type attribute's Object Identifier (OID), which is obtained from the MIB file.

Attribute	Slot Key (Event Type UUID)	Slot Type	Slot Value (Event Attribute OID)
Service	uddi_16d34470-9a92-11dd-9b43-e319c2a6593c	xs:string	1.3.6.1.4.1.1783.201.1.1.1
Target	uddi_f18b5a40-9a91-11dd-b95e-b4758b17b88b	xs:string	1.3.6.1.4.1.1783.201.1.1.2
TimeStamp	uddi_c798d3c0-9a91-11dd-889e-b999c87ba6b7	xs:datetime	1.3.6.1.4.1.1783.201.1.1.3
Consumer	uddi_a7476ff0-a108-11dd-9c38-d8fd010529cc	xs:string	1.3.6.1.4.1.1783.201.1.1.4
RequestStatus	uddi_a7476ff0-a108-11dd-9c38-eac6d60fc855	xs:string	1.3.6.1.4.1.1783.201.1.1.5

Attribute	Slot Key (Event Type UUID)	Slot Type	Slot Value (Event Attribute OID)
ResponsePayload	uddi_a747704b-a108-11dd-9c38-fde9d932116a	xs:anyURI	1.3.6.1.4.1.1783.201.1.1.6
RequestPayload	uddi_a745265b-a108-11dd-9c38-bf43eee17363	xs:anyURI	1.3.6.1.4.1.1783.201.1.1.7
ProviderRound TripTime	uddi_a7476ff0-a108-11dd-9c38-f3f84c6111f0	xs:integer	1.3.6.1.4.1.1783.201.1.1.8
TotalRoundTrip Time	uddi_a7476ff0-a108-11dd-9c38-d02170b3aae3	xs:integer	1.3.6.1.4.1.1783.201.1.1.9
SessionID	uddi_21b67010-9a92-11dd-926a-991c4c180c79	xs:string	1.3.6.1.4.1.1783.201.1.1.16
ConsumerIP	uddi_a7476ff0-a108-11dd-9c38-d34f346cb3d5	xs:string	1.3.6.1.4.1.1783.201.1.1.17
OperationName	uddi_f1c8a185-4b18-4974-a360-6c70756a174a	xs:string	1.3.6.1.4.1.1783.201.1.1.21
NativeEndpoint	uddi_524d05f5-d526-4605-b594-ace1cb750d33	xs:string	1.3.6.1.4.1.1783.201.1.1.22

Event Modeling

An event is an instance of an event type. Events are modeled in a separate schema from the event type schema. CentraSite models events as non-registry objects (to avoid storing large amounts of unwanted event data in the registry/repository), and instead stores event data in a database collection within the Event Receiver. CentraSite maps events to their corresponding event types, using the event types' UUIDs. Similarly, events are mapped to target types, targets and services using UUIDs and the event type attributes.

The stored event data will contain:

- The event Trap ID (MIB OID).
- The event Trap value, which consists of:
 - The attribute key (MIB OID).
 - The attribute value.

The event data is stored in the Event Receiver as an "events" doctype.

If an event contains payloads (e.g., File-Type attributes such as ResponsePayload and RequestPayload), the payloads are stored in the Event Receiver as a "payloads" doctype, and will be referenced by the event stored under the "event" doctype, using ino:id. This is used to reduce de-serialization of the usually large payloads, and to improve performance of queries on the stored events.

Viewing Run-Time Events and Metrics

You can view the run-time events and metrics that occurred for:

- A particular target or all targets (see "[Viewing Run-Time Events and Metrics for Targets](#)" on page 329).
- Each virtual service (see "[Viewing Run-Time Events and Metrics for Virtual Services](#)" on page 331).
- Each API (see "[Viewing Run-Time Events and Metrics for APIs](#)" on page 331).

Viewing Run-Time Events and Metrics for Targets

Use the following procedure to view lists of run-time events for a particular target or for all targets.

If you are using the Mediator target, ensure that Mediator is configured to send event notifications to the destination(s) that are applicable for each event type. For details, see *Administering webMethods Mediator*.

Note: You must have the permissions to manage targets, as described in "[Run-Time Gateways](#)" on page 21.

To view a list of run-time events for targets

1. In CentraSite Control, go to **Operations > Events > Event List**.
2. Use the following fields to filter the event list you want to view:

In this field...	Specify...
Target Type	The type of the target whose events you want to view.

In this field...	Specify...
Target	The target whose events you want to view (or select All to view events of all targets).
Event Type	A particular event type, or select All to view all event types. For descriptions of the predefined event types, see " The Run-Time Event Types " on page 314.
Service Type	Select All or Virtual Service . Note: CentraSite does not provide out-of-the-box policy-enforcement for web services.
Date Range	A range of dates from which to view the events.
Start Date	Alternatively, select the check box next to this field and click the calendar and select a starting date and time.
End Date	Click the calendar and select an ending date and time.

- Click the **Search** button.
- The generated event list displays the following information:

Field	Description
Date/Time	The date/time that the event occurred. Click this hyperlinked value to view the Event Detail page, which will contain the event's SOAP request or response name in the Attribute column. Click the hyperlinked request or response name to display the full SOAP request or response.
Session ID	(Read-only.) The session ID that generated the event.
Event Type	(Read-only.) The type of event (e.g., Monitoring, Policy Violation, Error, etc.).
Service Name	(Read-only.) The name of the service that caused the event.
Service Type	(Read-only.) The service's type.
Target	(Read only.) The target on which the event occurred.
Target Type	(Read only.) The type of the target on which the event occurred.

Note: To view the list of attributes that are mapped for each event type, go to the target type's detail page (see ["Run-Time Gateways" on page 21](#)).

Viewing Run-Time Events and Metrics for Virtual Services

You can view the events and metrics for a virtual service in its Events profile and its Performance profile. For details, see ["Virtualized Services in CentraSite " on page 29](#).

Viewing Run-Time Events and Metrics for APIs

You can view the events and metrics for an API in its Runtime Events profile and its Runtime Metrics profile. For details, see ["Virtualized Services in CentraSite " on page 29](#).

Creating Custom Run-Time Events

CentraSite provides the predefined event types described in ["The Run-Time Event Types" on page 314](#). In addition, you can create custom run-time events that CentraSite will monitor.

Prerequisite: You must have the Manage Runtime Event Types permission. By default, the predefined roles CentraSite Administrator and Operations Administrator include this permission. For more information about roles and permissions, see *Getting Started with CentraSite*.

Important: To enable CentraSite to recognize custom event types, ensure that your MIB file (which is contained in your target type definition file) contains the SNMP Traps metadata and Object Identifiers for the custom events. For more information, see ["Run-Time Gateways" on page 21](#).

To create custom event types

1. In CentraSite Control, go to **Operations > Events > Event Types** to display the **Event Types** page.

The page displays all the predefined event types (Monitoring, Policy Violation, Transaction, Error and Lifecycle) and any custom event types that have been defined.

2. To view the details of any event type, click its hyperlinked name.

The list of attributes for the event type is displayed. You can edit the attributes of custom event types, but not the predefined event types (see ["Modifying Run-Time Events" on page 332](#)).

3. To create a custom event type, click the **Add Event Type** button. In the **Add/Edit Event Type** page specify a name and description for the event type. Event type names can contain any character (including spaces), and are not case-sensitive.

4. In the Event Type Attribute panel, the following default attributes are displayed. These attributes are required and cannot be deleted.

Attribute	Data Type
TimeStamp	Date
Target	String
Service	String
SessionID	String

To create additional attributes, perform the following steps:

- a. Click the plus button at the bottom of the attribute list.
- b. Specify a name in the **Name** column and a value in the **Data Type** column (Boolean, File, Date, Integer or String). Attribute names can contain any character (including spaces).
- c. To add another attribute, click the plus button at the bottom of the list.
- d. To delete an attribute, click the minus button for the attribute you want to delete.
- e. Click **Save**.

Modifying Run-Time Events

To edit and delete custom event types, perform the following steps.

To modify a custom run-time event

1. In CentraSite Control, go to **Operations > Events > Event Types** to display the **Event Types** page.
The page displays all event types that have been defined.
2. To delete a custom event type, select the check box next to the event type and click the **Delete** button.
3. To edit the attributes of a custom event type, perform the following steps:
 - a. Click its hyperlinked name to display the **Add/Edit Event Type** page.
 - b. You can change the value of an attribute's data type, but not its name. Data types can be Boolean, File, Date, Integer or String.
 - c. To add another attribute, use the plus button at the bottom of the list.
 - d. To delete an attribute, click the minus button next to the attribute.
 - e. Click **Save**.

Built-In Run-Time Actions Reference for Virtual Services

This section describes the built-in run-time actions that you can include in run-time policies for virtual services. You use these actions only when you are using CentraSite Control to create run-time policies for virtual services. The content is organized under the following sections:

Summary of the Run-Time Actions for Virtual Services

You can include the following kinds of built-in run-time actions in the run-time policies for virtual services:

- ["WS-SecurityPolicy 1.2 Actions" on page 333](#)
- ["Monitoring Actions" on page 334](#)
- ["Additional Actions" on page 334](#)

WS-SecurityPolicy 1.2 Actions

Mediator provides two kinds of actions that support WS-SecurityPolicy 1.2: authentication actions and XML security actions.

Authentication Actions (WS-SecurityPolicy 1.2)

Mediator uses the following authentication actions to verify that the requests for virtual services contain a specified WS-Security element:

Require WSS Username Token	Uses WS-SecurityPolicy authentication to validate user names and passwords that are transmitted in the SOAP message header for the WSS Username token.
Require WSS X.509 Token	Identifies consumers based on a WSS X.509 token.
Require WSS SAML Token	Uses a WSS Security Assertion Markup Language (SAML) assertion token to validate service consumers.

XML Security Actions (WS-SecurityPolicy 1.2)

These actions provide confidentiality (through encryption) and integrity (through signatures) for request and response messages.

Require Signing	Requires that a request's XML element (which is represented by an XPath expression) be signed.
------------------------	--

Require Encryption	Requires that a request's XML element (which is represented by an XPath expression) be encrypted.
Require SSL	Requires that requests be sent via SSL client certificates, and can be used by both SOAP and REST services.
Require Timestamps	Requires that timestamps be included in the request header. Mediator checks the timestamp value against the current time to ensure that the request is not an old message. This serves to protect your system against attempts at message tampering, such as replay attacks.

Monitoring Actions

Mediator provides the following run-time monitoring actions:

Monitor Service Performance	This action monitors a user-specified set of run-time performance conditions for a virtual service, and sends alerts to a specified destination when these performance conditions are violated.
Monitor Service Level Agreement	This action provides the same functionality as “Monitor Service Performance” but this action is different because it enables you to monitor a virtual service's run-time performance especially for particular consumer(s). You can configure this action to define a <i>Service Level Agreement (SLA)</i> , which is set of conditions that defines the level of performance that a specified consumer should expect from a service.
Throttling Traffic Optimization	(Not available in Mediator versions below 9.0.) This action limits the number of service invocations during a specified time interval, and sends alerts to a specified destination when the performance conditions are violated. You can use this action to avoid overloading the back-end services and their infrastructure, to limit specific consumers in terms of resource usage, etc.

Additional Actions

Mediator provides the following actions, which you can use in conjunction with the actions above.

Identify Consumer	You use this action in conjunction with an authentication action (“Require WSS Username Token”, “Require WSS X.509 Token” or “Require HTTP Basic Authentication”). Alternatively, you can
--------------------------	---

	use this action alone to identify consumers only by host name or IP address.
Require HTTP Basic Authentication	This action uses HTTP basic authentication to verify the consumer's authentication credentials contained in the request's Authorization header against the Integration Server's user account.
Authorize User	This action authorizes consumers against a list of users and/or a list of groups registered in the Integration Server on which Mediator is running. You use this action in conjunction with an authentication action “Require WSS Username Token”, “Require WSS SAML Token” or “Require HTTP Basic Authentication”.
Authorize Against Registered Consumers	This action authorizes consumer applications against all consumer applications who are registered in CentraSite as consumers for the service.
Log Invocations	Logs request/response payloads to a destination you specify.
Validate Schema	Validates all XML request and/or response messages against an XML schema referenced in the WSDL.

Configuring Destinations for Alerts and Logs

You can configure the destinations to which Mediator should send the alerts and transaction logging payloads generated by the built-in run-time actions that you include in run-time policies for virtual services.

The destinations can be configured at the:

- **Service level**, for the event types: Transaction Event and Monitoring Event
Refer to “Destinations for the Monitoring and Transaction Events” in *Run-Time Governance with CentraSite* for additional details on service level configuration.
- **Global level** (for all services), for metrics and the event types: Policy Violation Event, Error Event, and Lifecycle Event
Refer *Administering webMethods Mediator* for additional details on global level configuration.

You can configure one of the following destinations for alerts:

- CentraSite
- Local Log
- SNMP (CentraSite SNMP server or third-party SNMP server configured in Integration Server)

- E-mail
- EDA (to publish run-time events and KPI metrics to a database or a messaging server configured in Integration Server)

You can select one of the following destinations for transaction payloads:

- CentraSite
- Local Log
- SNMP (CentraSite SNMP server or third-party SNMP server configured in Integration Server)
- E-mail
- Audit Log (only for Log Invocation)
- EDA (to publish run-time events and KPI metrics to a database or a messaging server configured in Integration Server)

You can configure the EDA destination for the following policy actions:

- Log Invocation
- Monitor Service Level Agreement
- Monitor Service performance
- Throttling Traffic Optimization

The `watt.server.auth.skipForMediator` Property

This property specifies whether Integration Server authenticates requests for Mediator. You must set this property to true.

No request to Mediator should be authenticated by Integration Server. Instead, authentication should be handled by Mediator. Thus, to enable Mediator to authenticate requests, you must set `skipForMediator` to true (by default it is false).

When this parameter is set to true, Integration Server skips authentication for Mediator requests and allows the user credentials (of any type) to pass through so that Mediator can authenticate them. If you change the setting of this parameter, you must restart Integration Server for the changes to take effect.

To set `skipForMediator` to true

1. In the Integration Server Administrator, click **Settings > Extended**.
2. Click **Show and Hide Keys**.

Look for the `watt.server.auth.skipForMediator` property and ensure it is set to true.

3. If the `watt.server.auth.skipForMediator` property is not present, add it as follows:

- a. Click **Edit Extended Settings**.
- b. Type `watt.server.auth.skipForMediator=true` on a separate line.
- c. Click **Save**.
- d. Restart Integration Server.

Action Evaluation Order and Dependencies

When you deploy a virtual service, CentraSite automatically validates the service's run-time policy (or policies) to ensure that:

- Any action that appears in a single policy multiple times is allowed to appear multiple times.

For those actions that can appear in a policy only once (for example, Identify Consumer), Mediator will choose only one, which might cause problems or unintended results.

- All action dependencies are properly met. That is, some actions must be used in conjunction with another particular action.

CentraSite will inform you of any violation, and you will need to correct the violations before deploying the service.

Effective Policies

When you deploy a virtual service to Mediator, CentraSite combines the actions specified within the service's run-time policy (or policies) that apply to the virtual service, and generates what is called the *effective policy* for the virtual service. For example, suppose your virtual service is within the scope of two run-time policies: one policy that performs a logging action and another policy that performs a security action. When you deploy the virtual service, CentraSite automatically combines the two policies into one effective policy. The effective policy, which contains both the logging action and the security action, is the policy that CentraSite actually deploys to Mediator with the virtual service.

When CentraSite generates the effective policy, it validates the resulting action list to ensure that it contains no conflicting or incompatible actions. If the list contains conflicts or inconsistencies, CentraSite resolves them according to Policy Resolution Rules. For example, an action list can include only one Identify Consumer action. If the resulting action list contains multiple Identify Consumer actions, CentraSite resolves the conflict by including only one of the actions (selected according to a set of internal rules) in the effective policy and omitting the others.

The effective policy that CentraSite produces for a virtual service is contained in an object called a *virtual service definition* (VSD). The VSD is given to Mediator when you deploy the virtual service. After you deploy a virtual service, you can view its VSD (and thus examine the effective policy that CentraSite generated for it) from the CentraSite user interface or from the Mediator user interface.

The following table shows:

- The order in which Mediator evaluates the actions.
- Action dependencies (that is, whether an action must be used in conjunction with another particular action).
- Whether an action can be included multiple times in a single policy. If an action cannot be included multiple times in a single policy, Mediator selects just one for the effective policy, which may cause problems or unintended results.

Evaluation Order	Action	Dependency	Can include multiple times in a policy?
1	"Require SSL" on page 361	None.	If multiple actions appear, and one of them has its Client Certificate Required parameter set to Yes, only one occurrence of the action appears in the effective policy.
2	"Require HTTP Basic Authentication" on page 359	In Mediator versions below 9.0: None. In Mediator version 9.0 and above: Identify Consumer.	No. Mediator includes only one action in the effective policy.
3	"Require WSS Username Token" on page 364	Identify Consumer action.	No. Mediator includes only one action in the effective policy.
4	"Require WSS X.509 Token" on page 364	Identify Consumer action.	No. Mediator includes only one action in the effective policy.
5	"Require WSS SAML Token" on page 362	None.	No. Mediator includes only one action in the effective policy.
6	"Require Signing" on page 360	Identify Consumer action.	Yes. Mediator generates a UNION of all Require Signing

Evaluation Order	Action	Dependency	Can include multiple times in a policy?
			actions for the effective policy.
7	"Require Encryption" on page 357	Identify Consumer action.	Yes. Mediator generates a UNION of all Require Encryption actions for the effective policy.
8	"Require Timestamps" on page 362	Require Signing <i>and</i> Require Encryption.	No. Mediator includes only one action in the effective policy.
9	"Identify Consumer" on page 344	<p>If Identify Consumer's identifier field is set to:</p> <ul style="list-style-type: none"> ■ HTTP Authentication Token, the action Require HTTP Basic Authentication is also required. ■ WS-Security Authentication Token, the action Require WSS Username Token is also required. ■ Consumer Certificate, the actions Require WSS X.509 Token or Require Signing are also required. 	No. Mediator includes only one action in the effective policy.
10	"Authorize User" on page 343	Require HTTP Basic Authentication, Require WSS Username Token <i>or</i>	No. Mediator includes only one action in the effective policy.

Evaluation Order	Action	Dependency	Can include multiple times in a policy?
		Require WSS SAML Token.	
11	"Authorize Against Registered Consumers" on page 343	Identify Consumer action.	No. Mediator includes only one action in the effective policy.
12	"Validate Schema" on page 368	None.	If at least one occurrence of the action is configured to validate requests, and at least one occurrence of the action is configured to validate responses, then Mediator includes in the effective policy an action to validate both requests and responses. Otherwise, an action is chosen which validates only requests or only responses (depending on the value of the Validate SOAP Messages parameter of the action).
13	"Log Invocation" on page 347	None.	No. Mediator includes only one action in the effective policy.
14	"Monitor Service Performance" on page 349	None.	Yes. Mediator includes all Monitor Service Performance actions in the effective policy.
15	"Monitor Service Level	Identify Consumer action.	Yes. Mediator includes all Monitor

Evaluation Order	Action	Dependency	Can include multiple times in a policy?
	Agreement" on page 353		Service Level Agreement actions in the effective policy.
16	"Throttling Traffic Optimization" on page 364	Identify Consumer (if the Limit Traffic for Applications option is selected).	Yes. Mediator includes all Throttling Traffic Optimization actions in the effective policy.

Usage Cases for Identifying/Authenticating Consumers

When deciding which type of identifier to use to identify a consumer application, consider the following points:

- Whatever identifier you choose to identify a consumer application, it must be unique to the application. Identifiers that represent user names are often not suitable because the identified users might submit requests for multiple applications.
- Identifying applications by IP address or host name is often a suitable choice, however, it does create a dependency on the network infrastructure. If a consumer application moves to a new machine, or its IP address changes, you must update the identifiers in the application asset.
- Using X.509 certificates or a custom token that is extracted from the SOAP message itself (using an XPATH expression), is often the most trouble-free way to identify a consumer application.

Following are some common combinations of actions used to authenticate/identify consumers.

■ Scenario 1: Identify consumers by IP address or host name

- The simplest way to identify consumers is to use the Identify Consumer action and set its `Identify User Using` parameter to specify either a host name or an IP address (or a range of IP addresses).

■ Scenario 2: Authenticate consumers by HTTP authentication token

Use the following actions:

- Identify Consumer action, and set its `Identify User Using` parameter to HTTP Authentication Token (to identify consumers using the token derived from the HTTP header).
- Require HTTP Basic Authentication.
- Additionally, you can use one or both of the following:

- Authorize User action (to authorize a list of users and/or groups registered in the Integration Server on which Mediator is running).
- Authorize Against Registered Consumers action (to authorize consumer applications against all Application assets registered as consumers for a service in CentraSite).
- **Scenario 3: Authenticate consumers by WS-Security authentication token**

Use the following actions:

 - Identify Consumer action, and set its `Identify User Using` parameter to `WS-Security Authentication Token` (to identify consumers using the token derived from the WSS Header).
 - Require WSS Username Token action.
 - Additionally, you can use one or both of the following:
 - Authorize User action (to authorize a list of users and/or groups registered in the Integration Server on which Mediator is running).
 - Authorize Against Registered Consumers action (to authorize consumer applications against all Application assets registered as consumers for a service in CentraSite).
- **Scenario 4: Authenticate consumers by WSS X.509 token**
 - Identify Consumer action, and set its `Identify User Using` parameter to `Consumer Certificate` (to identify consumers using the WSS X.509 token).
 - Require WSS X.509 Token action
 - Require SSL action.

Run-Time Actions Reference for Virtual Services

This section describes the following built-in run-time actions that you can include in run-time policies for virtual services:

- ["Authorize Against Registered Consumers" on page 343](#)
- ["Authorize User" on page 343](#)
- ["Identify Consumer" on page 344](#)
- ["Log Invocation" on page 347](#)
- ["Monitor Service Performance" on page 349](#)
- ["Monitor Service Level Agreement" on page 353](#)
- ["Require Encryption" on page 357](#)
- ["Require HTTP Basic Authentication" on page 359](#)
- ["Require Signing" on page 360](#)

- ["Require SSL" on page 361](#)
- ["Require Timestamps" on page 362](#)
- ["Require WSS SAML Token" on page 362](#)
- ["Require WSS Username Token" on page 364](#)
- ["Require WSS X.509 Token" on page 364](#)
- ["Throttling Traffic Optimization" on page 364](#)
- ["Validate Schema" on page 368](#)

Authorize Against Registered Consumers

Note: Dependency requirement: A policy that includes this action must also include the ["Identify Consumer" on page 344](#) action. However, if the ["Identify Consumer" on page 344](#) action is set to identify users via the **HTTP Authentication Token** option, then "Authorize Against Registered Consumers" should not be included in the policy.

Authorizes consumer applications against all consumer applications who are registered in CentraSite as consumers for the service.

Input Parameters

None.

Authorize User

Note: Dependency requirement: A policy that includes this action must also include *one* of the following: the ["Require WSS SAML Token" on page 362](#) action or the ["Identify Consumer" on page 344](#) action with one of the following options selected: "HTTP Authentication Token" or "WS-Security Authentication Token".

Authorizes consumers against a list of users and/or a list of groups registered in the Integration Server on which Mediator is running.

Input Parameters

Perform authorization
against list of users

Boolean Authorizes consumers against a list of users who are registered in the Integration Server on which Mediator is running. Specify one or more users in the fields below this option.

Perform authorization
against list of groups

Boolean Authorizes consumers against a list of groups who are registered in the Integration Server

on which Mediator is running. Specify one or more groups in the fields below this option.

Note: By default, both of the input parameters are selected. If you de-select one of these parameters, the fields showing the list of users (or groups) is not displayed.

Identify Consumer

Mediator uses this action to identify consumer applications based on the kind of consumer identifier (IP address, HTTP authorization token, etc.) you specify. Alternatively, this action provides an option to allow anonymous users to access the assets.

Input Parameters

Anonymous Usage Allowed *Boolean* Specifies whether to allow all users to access the asset, without restriction.

<u>Value</u>	<u>Description</u>
False	<i>Default.</i> Allows only the users specified in the <code>Identify User Using</code> parameter to access the assets.
True	Allow all users to access the asset. In this case, do not configure the <code>Identify User Using</code> parameter.

Identify User Using *String* Specifies the kind of consumer identifier that the action will use to identify consumer applications.

<u>Value</u>	<u>Description</u>
IP Address	Identifies one or more consumer applications based on their originating IP addresses.
Host Name	Identifies consumer applications based on a host name.
HTTP Authentication Token	Uses HTTP Basic authentication to verify the consumer's authentication credentials contained in the request's Authorization header. Mediator authorizes the credentials against

the list of consumers available in the Integration Server on which Mediator is running. This type of consumer authentication is referred to as “preemptive authentication”. If you want to use “preemptive authentication”, you should also include the action ["Require HTTP Basic Authentication" on page 359](#) in the policy.

If you choose to omit “Require HTTP Basic Authentication”, the client will be presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated. This type of consumer authentication is referred to as “non-preemptive authentication”. For more information, see ["Require HTTP Basic Authentication" on page 359](#).

Note: If you select the value HTTP Authentication Token, do not include the Authorize Against Registered Consumers action in the policy. This is an invalid combination.

WS-Security Authentication Token	Validate user names and passwords that are transmitted in the SOAP message header in the WSS Username Token. If you select this value, you should also include the action "Require WSS Username Token" on page 364 in the policy.
Custom Identification	Validates consumer applications based on an XML element (represented by an XPath expression).
Consumer Certificate	Identifies consumer applications based on information in a WSS X.509 certificate. If you select this value, you should also include the action "Require WSS X.509 Token" on page 364 or the action "Require Signing" on page 360 in the policy.

Client
Certificate
for SSL
Connectivity

Validates the client's certificate that the consumer application submits to the asset in CentraSite. The client certificate that is used to identify the consumer is supplied by the client to the Mediator during the SSL handshake over the transport layer. In order to identify consumers by transport-level certificates, the run-time communication between the client and the Mediator must be over HTTPS and the client must pass a valid certificate.

To use this option, the following prerequisites must be met:

- In Integration Server, create a keystore and truststore, as described in *webMethods Integration Server Administrator's Guide*.
- In Integration Server, create an HTTPS port, as described in *webMethods Integration Server Administrator's Guide*.
- Configure Mediator by setting the IS Keystore and IS Truststore parameters, as described in *Administering webMethods Mediator*.
- Configure Mediator by setting the HTTPS Ports Configuration parameter, as described in *Administering webMethods Mediator*.

When deciding which type of identifier to use to identify a consumer application, consider the following points:

- Whatever identifier you choose to identify a consumer application, it must be unique to the application. Identifiers that represent user names are often not suitable because the identified users might submit requests for multiple applications.
- Identifying applications by IP address or host name is often a suitable choice, however, it does create a dependency on the network infrastructure. If a consumer application moves to a new machine, or its IP address changes, you must update the identifiers in the application asset.
- Using X.509 certificates or a custom token that is extracted from the SOAP or XML message itself (using an XPATH expression), is often the most trouble-free way to identify a consumer application.

Log Invocation

Logs request/response payloads. You can specify the log destination and the logging frequency. This action also logs other information about the requests/responses, such as the service name, operation name, the Integration Server user, a timestamp, and the response time.

Note: You can include this action multiple times in a policy.

Input Parameters

Log the
Following
Payloads

String Optional. Specifies whether to log all request payloads, all response payloads, or both.

Value	Description
Request	Log all request payloads.
Response	Log all response payloads.

Log
Generation
Frequency

String Specifies how frequently to log the payload.

Value	Description
Always	Log all requests and/or responses.
On Success	Log only the successful responses and/or requests.
On Failure	Log only the failed requests and/or responses.

Send Data To

String Specifies where to log the payload.

Important: Ensure that Mediator is configured to log the payloads to the destination(s) you specify here. For details about alerts and transaction logging, see *Administering webMethods Mediator*.

Value	Description
CentraSite	Logs the payloads in the virtual service's Events profile in CentraSite.

	<p>Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Local Log	<p>Logs the payloads in the server log of the Integration Server on which Mediator is running.</p> <p>Also choose a value in the Log Level field:</p> <ul style="list-style-type: none"> ■ Info: Logs error-level, warning-level, and informational-level alerts. ■ Warn: Logs error-level and warning-level alerts. ■ Error: Logs only error-level alerts. <div style="border: 1px solid #ccc; background-color: #f0f0f0; padding: 5px; margin-top: 10px;"> <p>Important Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to Settings > Logging > Server Logger).</p> </div>
SNMP	<p>Logs the payloads in CentraSite's SNMP server or a third-party SNMP server.</p> <p>Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > SNMP). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Email	<p>Sends the payloads to an SMTP email server, which sends them to the email address(es) you specify here. Mediator sends the payloads as email attachments that are compressed using gzip data compression. To specify multiple addresses, use the  button to add rows.</p> <p>Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Audit Log	<p>Logs the payload to the Integration Server audit logger. For more information about</p>

logging, see the *webMethods Audit Logging Guide*.

Note: If you expect a high volume of events in your system, it is recommended that you select the Audit Log destination for this action.

EDA

Sends data about run-time events and KPI metrics to a database or a messaging server such as webMethods Universal Messaging depending on the destination that you configure in Integration Server.

Prerequisite You must configure the EDA destination in Integration Server on the **Solutions > Mediator > Administration > EDA Configuration** page. For details, see *Administering webMethods Mediator*.

Monitor Service Performance

This action monitors a user-specified set of run-time performance conditions for a virtual service, and sends alerts to a specified destination when the performance conditions are violated. You can include this action multiple times in a single policy.

For the counter-based metrics (Total Request Count, Success Count, Fault Count), Mediator sends an alert as soon as the performance condition is violated, without having to wait until the end of the metrics tracking interval. You can choose whether to send an alert only once during the interval, or every time the violation occurs during the interval. (Mediator will send another alert the next time a condition is violated during a subsequent interval.) For information about the metrics tracking interval, see "[The Metrics Tracking Interval](#)" on page 318.

For the aggregated metrics (Average Response Time, Minimum Response Time, Maximum Response Time), Mediator aggregates the response times at the end of the interval, and then sends an alert if the performance condition is violated.

This action does not include metrics for failed invocations.

Note: To enable Mediator to publish performance metrics, you must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.

Input Parameters

Action
Configuration
parameters

Specify one or more conditions to monitor. To do this, specify a metric, operator, and a value for each metric. To specify multiple conditions, use the  button to add multiple rows. If multiple parameters are used, they are connected by the AND operator.

Name

String Array The metrics to monitor.

<u>Value</u>	<u>Description</u>
Availability	Indicates whether the service was available to the specified consumers in the current interval.
Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. Response time is measured from the moment Mediator receives the request until the moment it returns the response to the caller.
Concurrent Connections	Indicates whether the service was accessed by multiple consumers at the same time in the current interval.
Fault Count	The number of faults returned in the current interval.
Maximum Response Time	The maximum amount of time to respond to a request in the current interval.
Minimum Response Time	The minimum amount of time to respond to a request in the current interval.
Successful Request Count	The number of successful requests in the current interval.

Total Request Count	The total number of requests (successful and unsuccessful) in the current interval.
Operator	<i>String Array</i> Choose an appropriate operator.
Value	<i>String Array</i> Specify an appropriate value.
Alert parameters	<i>Object</i> Specify the following parameters for the alerts that will report on the conditions:
Alert Interval	<i>Number</i> The time period (in minutes) in which to monitor performance before sending an alert if a condition is violated. For information about the metrics tracking interval, see " The Metrics Tracking Interval " on page 318.
Alert Frequency	<i>String</i> Specifies how frequently to issue alerts for the counter-based metrics (Total Request Count, Success Count, Fault Count).

<u>Value</u>	<u>Description</u>
Every Time	Issue an alert every time one of the specified conditions is violated.
Only Once	Issue an alert only the first time one of the specified conditions is violated.

Reply to Destination *String* Specifies where to send the alerts.

Important: Ensure that Mediator is configured to send event notifications to the destination(s) you specify here. For details, see *Administering webMethods Mediator*

<u>Value</u>	<u>Description</u>
CentraSite	Sends the alerts to the virtual service's Events profile in CentraSite. Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For the procedure, see <i>Administering webMethods Mediator</i> .

Local Log	<p>Sends the alerts to the server log of the Integration Server on which Mediator is running.</p> <p>Also choose a value in the <code>Log Level</code> field:</p> <ul style="list-style-type: none"> ■ Info: Logs error-level, warning-level, and informational-level alerts. ■ Warn: Logs error-level and warning-level alerts. ■ Error: Logs only error-level alerts.
	<p>Important: The Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to Settings > Logging > Server Logger).</p>
SNMP	<p>Sends the alerts to CentraSite's SNMP server or a third-party SNMP server.</p> <p>Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Email	<p>Sends the alerts to an SMTP email server, which sends them to the email address(es) you specify here. To specify multiple addresses, use the  button to add rows.</p> <p>Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
EDA	<p>Sends data about run-time events and KPI metrics to a database or a messaging server such as webMethods Universal Messaging depending on the destination that you configure in Integration Server.</p> <p>Prerequisite You must configure the EDA destination in Integration Server on the Solutions > Mediator > Administration ></p>

EDA Configuration page. For details, see *Administering webMethods Mediator*.

Alert Message *String* Optional. Specify a text message to include in the alert.

Monitor Service Level Agreement

Note: Dependency requirement: A policy that includes this action must also include the ["Identify Consumer" on page 344](#) action.

This action is similar to the Monitor Service Performance action. Both actions can monitor the same set of run-time performance conditions for a virtual service, and then send alerts when the performance conditions are violated. This action is different because it enables you to monitor run-time performance for *one or more specified consumers*. You can include this action multiple times in a single policy.

You can configure this action to define a *Service Level Agreement (SLA)*, which is a set of conditions that defines the level of performance that a consumer should expect from a service. You can use this action to identify whether a service's threshold rules are met or exceeded. For example, you might define an agreement with a particular consumer that sends an alert to the consumer if responses are not sent within a certain maximum response time. You can configure SLAs for each virtual service/consumer application combination.

For the counter-based metrics (Total Request Count, Success Count, Fault Count), Mediator sends an alert as soon as the performance condition is violated, without having to wait until the end of the metrics tracking interval. You can choose whether to send an alert only once during the interval, or every time the violation occurs during the interval. (Mediator will send another alert the next time a condition is violated during a subsequent interval.) For information about the metrics tracking interval, see ["The Metrics Tracking Interval" on page 318](#).

For the aggregated metrics (Average Response Time, Minimum Response Time, Maximum Response Time), Mediator aggregates the response times at the end of the interval, and then sends an alert if the performance condition is violated.

This action does not include metrics for failed invocations.

Note: To enable Mediator to publish performance metrics, you must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.

Input Parameters

Action Configuration parameters Specify one or more conditions to monitor. To do this, specify a metric, operator, and value for each metric. To specify multiple conditions, use the  button to

add multiple rows. If multiple parameters are used, they are connected by the AND operator.

NameOperator

String Array The metrics to monitor.

<u>Value</u>	<u>Description</u>
Availability	Indicates whether the service was available to the specified consumers in the current interval.
Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. Response time is measured from the moment Mediator receives the request until the moment it returns the response to the caller.
Fault Count	Indicates the number of faults returned in the current interval.
Maximum Response Time	The maximum amount of time to respond to a request in the current interval.
Minimum Response Time	The minimum amount of time to respond to a request in the current interval.
Successful Request Count	The number of successful requests in the current interval.
Total Request Count	The total number of requests (successful and unsuccessful) in the current interval.

String Array Choose an appropriate operator.

Value

String Array Specify an appropriate value.

Alert for Consumer Applications

Object Array Specify the Application asset(s) to which this Service Level Agreement will apply. To specify

multiple Application assets, use the  button to add multiple rows.

Alert parameters

Object Specify the following parameters for the alerts that will report on the Service Level Agreement conditions:

Alert Interval

Number The time period (in minutes) in which to monitor performance before sending an alert if a condition is violated. For information about the metrics tracking interval, see "[The Metrics Tracking Interval](#)" on page 318.

Alert Frequency

String Specifies how frequently to issue alerts for the counter-based metrics (Total Request Count, Success Count, Fault Count).

<u>Value</u>	<u>Description</u>
Every Time	Issue an alert every time one of the specified conditions is violated.
Only Once	Issue an alert only the first time one of the specified conditions is violated.

Rule Expiration Date

String Specifies the date on which this Service Monitoring Performance action expires, in format MM/DD/YYYY.

Reply to Destination

String Specifies where to log the alert.

Important: Ensure that Mediator is configured to send event notifications to the destination(s) you specify here. For details, see *Administering webMethods Mediator*.

<u>Value</u>	<u>Description</u>
CentraSite	Sends the alerts to the virtual service's Events profile in CentraSite. Prerequisite: You must configure Mediator to communicate with

	<p>CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Local Log	<p>Sends the alerts to the server log of the Integration Server on which Mediator is running.</p> <p>Also choose a value in the Log Level field:</p> <ul style="list-style-type: none"> ■ Info: Logs error-level, warning-level, and informational-level alerts. ■ Warn: Logs error-level and warning-level alerts. ■ Error: Logs only error-level alerts. <div data-bbox="898 987 1369 1228" style="background-color: #f0f0f0; padding: 5px;"> <p>Important: Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to Settings > Logging > Server Logger).</p> </div>
SNMP	<p>Sends the alerts to CentraSite's SNMP server or a third-party SNMP server.</p> <p>Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Email	<p>Sends the alerts to an SMTP email server, which sends them to the email address(es) you specify here. To specify multiple addresses, use the  button to add rows.</p>

		<p>Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
	EDA	<p>Sends data about run-time events and KPI metrics to a database or a messaging server such as webMethods Universal Messaging depending on the destination that you configure in Integration Server.</p> <p>Prerequisite You must configure the EDA destination in Integration Server on the Solutions > Mediator > Administration > EDA Configuration page. For details, see <i>Administering webMethods Mediator</i>.</p>
Alert Message		<p><i>String</i> Optional. Specify a text message to include in the alert.</p>

Require Encryption

Requires that a request's XML element (which is represented by an XPath expression) be encrypted. This action supports WS-SecurityPolicy 1.2 and cannot be used with REST services.

Prerequisites

1. Configure Integration Server: Set up keystores and truststores in Integration Server, as described in *webMethods Integration Server Administrator's Guide*.
2. Configure Mediator: In the Integration Server Administrator, navigate to **Solutions > Mediator > Administration > General** and complete the IS Keystore Name, IS Truststore Name and Alias (signing) fields, as described in *Administering webMethods Mediator*.

When this policy action is set for the virtual service, Mediator provides decryption of incoming requests and encryption of outgoing responses. Mediator can encrypt and decrypt only individual elements in the SOAP message body that are defined by the XPath expressions configured for the policy action. Mediator requires that requests contain the encrypted elements that match those in the XPath expression. You must

encrypt the entire element, not just the data between the element tags. Mediator rejects requests if the element name is not encrypted.

Important: Do not encrypt the entire SOAP body because a SOAP request without an element will appear to Mediator to be malformed.

Mediator attempts to encrypt the response elements that match the XPath expressions with those defined for the policy. If the response does not have any elements that match the XPath expression, Mediator will not encrypt the response before sending. If the XPath expression resolves a portion of the response message, but Mediator cannot locate a certificate to encrypt the response, then Mediator sends a SOAP fault exception to the consumer and a Policy Violation event notification to CentraSite.

How Mediator Encrypts Responses

The Require Encryption action encrypts the response back to the client by dynamically setting a public key alias at run time. Mediator determines the public key alias as follows:

1. If Mediator can access the X.509 certificate of the client (based on the incoming request signature), it will use “useReqSigCert” as the public key alias.
OR
2. If the Identify Consumer action is present in the policy (and it successfully identifies a consumer application), then Mediator will look for a public key alias with that consumer name in the “IS Keystore Name” property. The “IS Keystore Name” property is specified in the Integration Server Administrator, under **Solutions > Mediator > Administration > General**. This property should be set to an Integration Server keystore that Mediator will use.

For an Identify Consumer action that allows for anonymous usage, Mediator does *not* require a consumer name in order to send encrypted responses. In this case, Mediator can use one of the following to encrypt the response in the following order, depending on what is present in the security element:

- A signing certificate.
- Consumer name.
- WSS username, SAML token or X.509 certificate.
- HTTP authorized user.

OR

3. If Mediator can determine the current IS user from the request (i.e., if an Integration Server WS-Stack determined that Subject is present), then the first principal in that subject is used.

OR

4. If the above steps all fail, then Mediator will use either the WS-Security username token or the HTTP Basic-Auth user name value. There should be a public key entry with the same name as the identified username.

Note: You can include this action multiple times in a single policy.

Input Parameters

Namespace *String* Optional. Namespace of the element required to be encrypted.

Note: Enter the namespace prefix in the following format:
`xmlns:<prefix-name>`. For example: `xmlns:soapenv`.

The generated XPath element in the policy should look similar to this:

```
<sp:SignedElements
xmlns:sp="http://docs.oasis-open.org/ws-sx/ws-security
policy/200702">
<sp:XPath
xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
//soapenv:Body</sp:XPath>
</sp:SignedElements>
```

Element *String* An XPath expression that represents the XML element
 Required to be Encrypted that is required to be encrypted.

Require HTTP Basic Authentication

This action uses HTTP Basic authentication to verify the consumer's authentication credentials contained in the request's Authorization header. Mediator authorizes the credentials against the list of consumers available in the Integration Server on which Mediator is running. This type of consumer authentication is referred to as "preemptive authentication". If you want to perform "preemptive authentication", a policy that includes this action must also include the Identify Consumer action.

If the user/password value in the Authorization header cannot be authenticated as a valid Integration Server user (or if the Authorization header is not present in the request), a 500 SOAP fault is returned, and the client is presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated. This type of consumer authentication is referred to as "non-preemptive authentication". If the client does not successfully respond to the challenge, a 401 "WWW-Authenticate: Basic" response is returned and the invocation is not routed to the policy engine. As a result, no events are recorded for that invocation, and its key performance indicator (KPI) data are not included in the performance metrics.

If you choose to omit the "Require HTTP Basic Authentication" action (and regardless of whether an Authorization header is present in the request or not), then:

- Mediator forwards the request to the native service, without attempting to authenticate the request.
- The native service returns a 401 “WWW-Authenticate: Basic” response, which Mediator will forward to the client; the client is presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated.

In the case where a consumer sends a request with transport credentials (HTTP Basic authentication) and message credentials (WSS Username or WSS X.509 token), the message credentials take precedence over the transport credentials when Integration Server determines which credentials it should use for the session. For more information, see ["Require WSS Username Token" on page 364](#) and ["Require WSS X.509 Token" on page 364](#). In addition, you must ensure that the service consumer that connects to the virtual service has an Integration Server user account.

Note: Do not include the “Require HTTP Basic Authentication” action in a virtual service's run-time policy if you selected the **OAuth2** option in the virtual service's Routing Protocol step.

Input Parameters

Note: This input parameter is not available in Mediator versions prior to 9.0.

Authenticate
Credentials

Required. Authorizes consumers against the list of consumers available in the Integration Server on which Mediator is running.

Require Signing

This action requires that a request's XML element (which is represented by an XPath expression) be signed. This action supports WS-SecurityPolicy 1.2.

Prerequisites

1. Configure Integration Server: Set up keystores and truststores in Integration Server, as described in *webMethods Integration Server Administrator's Guide*.
2. Configure Mediator: In the Integration Server Administrator, navigate to **Solutions > Mediator > Administration > General** and complete the IS Keystore Name, IS Truststore Name and Alias (signing) fields, as described in *Administering webMethods Mediator*. Mediator uses the signing alias specified in the Alias (signing) field to sign the response.

When this action is set for the virtual service, Mediator validates that the requests are properly signed, and provides signing for responses. Mediator provides support both for signing an entire SOAP message body or individual elements of the SOAP message body.

Mediator uses a digital signature element in the security header to verify that all elements matching the XPath expression were signed. If the request contains elements that were not signed or no signature is present, then Mediator rejects the request.

Note: Keep the following in mind:

1. You must map the public certificate of the key used to sign the request to an Integration Server user. If the certificate is not mapped, Mediator returns a SOAP fault to the caller.
2. You can include this action multiple times in a policy.

Input Parameters

Namespace *String* Optional. Namespace of the element required to be signed.

Note: Enter the namespace prefix in the following format:
`xmlns:<prefix-name>`. For example: `xmlns:soapenv`.

The generated XPath element in the policy should look similar to this:

```
<sp:SignedElements
xmlns:sp="http://docs.oasis-open.org/ws-sx/ws-security
policy/200702">
<sp:XPath
xmlns:soapenv="http://schemas.xmlsoap.org/soap/envelope/">
//soapenv:Body</sp:XPath>
</sp:SignedElements>
```

Element *String* An XPath expression that represents the XML element
 Required to be Signed that is required to be signed.

Require SSL

Requires that requests be sent via SSL client certificates. This action supports WS-SecurityPolicy 1.2 and can be used for both SOAP and REST services.

When this action is set for the virtual service, Mediator ensures that requests are sent to the server using the HTTPS protocol (SSL). The action also specifies whether the client certificate is required. This allows Mediator to verify the client sending the request. If the policy requires the client certificate, but it is not presented, Mediator rejects the message.

When a client certificate is required, the Integration Server HTTPS port should be configured to request or require a client certificate.

Input Parameters

Client
Certificate
Required

Boolean Specifies whether client certificates are required for the purposes of:

- Verifying the signature of signed SOAP requests or decrypting encrypted SOAP requests.
- Signing SOAP responses or encrypting SOAP responses.

Value	Description
Yes	Require client certificates.
No	Default. Do not require client certificates.

Require Timestamps

Note: Dependency requirement: A policy that includes this action must also include *any* one of the following actions: ["Require Signing" on page 360](#), ["Require Encryption" on page 357](#).

When this policy action is set for the virtual service, Mediator requires that timestamps be included in the request header. Mediator checks the timestamp value against the current time to ensure that the request is not an old message. This serves to protect your system against attempts at message tampering, such as replay attacks. This action supports WS-SecurityPolicy 1.2 and cannot be used with REST services.

Mediator rejects the request if either of the following happens:

- Mediator receives a timestamp that exceeds the time defined by the timestamp element.
- A timestamp element is not included in the request.

Input Parameters

None.

Require WSS SAML Token

When this action is set for a virtual service, Mediator uses a WSS Security Assertion Markup Language (SAML) assertion token to validate service consumers. This action supports WS-SecurityPolicy 1.2 and cannot be used with REST services.

For more information about configuring your system for SAML token processing, see *Administering webMethods Mediator*.

Input Parameters

SAML Subject Confirmation *String* Select one of the following SAML subject confirmation methods:

<u>Value</u>	<u>Description</u>
Holder of Key	<p>Default. Select this option if consumers use the SAML V1.1 or V2.0 Holder-of-Key Web Browser SSO Profile, which allows for transport of holder-of-key assertions. In this scenario, the consumer presents a holder-of-key SAML assertion acquired from its preferred identity provider to access a web-based resource at a service provider.</p> <p>If you select <code>Holder of Key</code>, Mediator also implicitly selects the “timestamp” and “signing” assertions to the virtual service definition (VSD). Thus, you should not add the “Require Timestamps” and “Require Signing” policy actions to a virtual service if the “Require WSS SAML Token” action is already applied.</p>
Bearer	<p>Select this option if consumers use SAML V1.1 Bearer token authentication, in which a Bearer token mechanism relies upon bearer semantics as a means by which the consumer conveys to Mediator the sender's identity.</p> <p>If you select <code>Bearer</code>, the “timestamp” and “signing” assertions will be added to the virtual service definition (VSD).</p> <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Note If consumers use SAML 2.0 Sender-Vouches tokens, configure your system as described in <i>Administering webMethods Mediator</i>.</p> </div>
SAML Version	<p><i>String</i> Specifies the WSS SAML Token version to use: 1.1 or 2.0.</p>

Require WSS Username Token

Note: Dependency requirement: A policy that includes this action must also include the Identify Consumer action.

When this policy action is set for the virtual service, Mediator uses WS-SecurityPolicy authentication to validate user names and passwords that are transmitted in the SOAP message header for the WSS Username token. This action supports WS-SecurityPolicy 1.2 and cannot be used with REST services.

In the case where a consumer is sending a request with both transport credentials (HTTP basic authentication) and message credentials (WSS Username or X.509 token), the message credentials take precedent over the transport credentials when Integration Server is determining which credentials it should use for the session. For more information, see ["Require HTTP Basic Authentication" on page 359](#).

Mediator rejects requests that do not include the username token and password of an Integration Server user. Mediator only supports clear text passwords with this kind of authentication

Input Parameters

None.

Require WSS X.509 Token

Note: Dependency requirement: A policy that includes this action must also include the Identify Consumer action.

Identifies consumers based on a WSS X.509 token. This action supports WS-SecurityPolicy 1.2 and cannot be used with REST services.

In the case where a consumer is sending a request with both transport credentials (HTTP Basic authentication) and message credentials (WSS X.509 token or WSS Username), the message credentials take precedence over the transport credentials when Integration Server is determining which credentials it should use for the session. For more information, see ["Require HTTP Basic Authentication" on page 359](#). In addition, you must ensure that the service consumer that connects to the virtual service has an Integration Server user account.

Input Parameters

None.

Throttling Traffic Optimization

Note: Keep the following in mind:

1. This action is not available in Mediator versions below 9.0.

2. **Dependency requirement:** A policy that includes this action must also include the Identify Consumer action if the `Limit Traffic for Applications` option is selected.

This action limits the number of service invocations during a specified time interval, and sends alerts to a specified destination when the performance conditions are violated.

Reasons for limiting the service invocation traffic include:

- To avoid overloading the back-end services and their infrastructure.
- To limit specific consumers in terms of resource usage (that is, you can use the “Monitor Service Level Agreement” action to monitor performance conditions for a particular consumer, together with “Throttling Traffic Optimization” to limit the resource usage).
- To shield vulnerable servers, services, and even specific operations.
- For service consumption metering (billable pay-per-use services).

Note: To enable Mediator to publish performance metrics, you must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.

Input Parameters

`Soft Limit` *Number* Optional. Specifies the maximum number of invocations allowed per `Interval` before issuing an alert. Reaching the soft limit will not affect further processing of requests (until the `Hard Limit` is reached).

Note: The limit is reached when the total number of invocations coming from *all* the consumer applications (specified in the `Limit Traffic for Applications` field) reaches the limit. `Soft Limit` is computed in an asynchronous manner; thus when multiple requests are made at the same time, it may be possible that the `Soft Limit` alert will not be strictly accurate.

`Hard Limit` *Number* Required. Specifies the maximum number of invocations allowed per alert interval before stopping the processing of further requests and issuing an alert. Typically, this number should be higher than the soft limit.

Note: The limit is reached when the total number of invocations coming from *all* the consumer applications (specified in the `Limit Traffic for Applications` field) reaches the limit. `Hard Limit` is

computed in an asynchronous manner; thus when multiple requests are made at the same time, it may be possible that the Hard Limit alert will not be strictly accurate.

Limit Traffic for Applications

String Specifies the consumer application(s) that this action applies to. To specify multiple consumer applications, use the  button to add rows, or select **Any Consumer** to apply this action to any consumer application.

Interval

Number Specifies the amount of time for the soft limit and hard limit to be reached.

Frequency

String Specifies how frequently to issue alerts.

<u>Value</u>	<u>Description</u>
Every Time	Issue an alert every time the specified condition is violated.
Only Once	Issue an alert only the first time the specified condition is violated.

Reply To Destination

String Optional. Specifies where to log the alerts.

Important: Ensure that Mediator is configured to send event notifications to the destination(s) you specify here. For details, see *Administering webMethods Mediator*.

<u>Value</u>	<u>Description</u>
CentraSite	Sends the alerts to the virtual service's Events profile in CentraSite. Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For the procedure, see <i>Administering webMethods Mediator</i> .
Local Log	Sends the alerts to the server log of the Integration Server on which Mediator is running.

Also choose a value in the `Log Level` field:

- Info: Logs error-level, warning-level, and informational-level alerts.
- Warn: Logs error-level and warning-level alerts.
- Error: Logs only error-level alerts.

Important: Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to **Solutions > Logging > Server Logger**).

SNMP

Sends the alerts to CentraSite's SNMP server or a third-party SNMP server.

Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > Email**). For the procedure, see *Administering webMethods Mediator*.

Email

Sends the alerts to an SMTP email server, which sends them to the email address(es) you specify here. To specify multiple addresses, use the  button to add rows.

Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > Email**). For the procedure, see *Administering webMethods Mediator*.

EDA

Sends data about run-time events and KPI metrics to a database or a messaging server such as webMethods Universal Messaging depending on the destination that you configure in Integration Server.

Prerequisite You must configure the EDA destination in Integration Server on the **Solutions > Mediator > Administration >**

EDA Configuration page. For details, see *Administering webMethods Mediator*.

Alert Message for Soft Limit	<i>String</i> Optional. Specify a text message to include in the soft limit alert.
Alert Message for Hard Limit	<i>String</i> Optional. Specify a text message to include in the hard limit alert.

Validate Schema

This action validates all XML request and/or response messages against an XML schema referenced in the WSDL.

Mediator can enforce this policy action for messages sent between services. When this policy is set for the virtual service, Mediator validates XML request messages, response messages, or both, against the XML schema referenced in the WSDL.

Input Parameters

Validate SOAP Message (s)	<i>Object</i> Validates request and/or response messages. You may select both Request and Response.
---------------------------	---

<u>Value</u>	<u>Description</u>
Request	Validate all requests.
Response	Validate all responses.

Important: Be aware that Mediator does not remove `wsu:Id` attributes that may have been added to a request by a consumer as a result of security operations against request elements (i.e., signatures and encryptions). In this case, to avoid schema validation failures you would have to add a Request Handling step to the virtual service so that the requests are passed to an XSL transformation file that removes the `wsu:Id` attribute.

Built-In Run-Time Actions Reference for APIs

This section describes the built-in run-time actions that you can include in run-time governance rules for APIs. You use these actions only when you are using the CentraSite Business UI to create run-time policies for APIs. The content is organized under the following sections:

Instructions throughout the remainder of this guide use the term “API” when referring to the Virtual Services, Virtual XML Services and Virtual REST Services; and the term “client” when referring to the consumer applications in general.

Summary of the Run-Time Actions

You can include the following kinds of built-in run-time actions in the run-time governance rules for APIs:

Request Handling Actions

Request Handling is the process of receiving and transforming the incoming message from a client into the custom format as expected by the native API.

Require HTTP / HTTPS	Specifies the protocol (HTTP or HTTPS) and SOAP format (for a SOAP-based API) to be used to accept and process the requests.
Require JMS	Specifies the JMS protocol to be used for the API to accept and process the requests.
Request Transformation	Invokes an XSL transformation in the SOAP request before it is submitted to the native API.
Invoke webMethods Integration Server	Invokes a webMethods Integration Server service to pre-process the request before it is submitted to the native API.
Enable REST Support	Enables REST support for an existing SOAP based API by exposing the API as a REST based API. If you include this policy action in a SOAP API request configuration, the SOAP API is exposed both as a SOAP based API and a REST based API. Clients who can only send REST requests can now invoke a REST-enabled SOAP API using a REST request.
	<p>Note: This policy action is set by default in the request step for all SOAP APIs. To disable the REST support for a SOAP API, delete the Enable REST Support action in the Request Handling step for the API.</p>
Set Media Type	Specifies the content type for a REST request. This action is applicable only if Enable REST Support is set for a SOAP API. If the content type header is missing in a client request sent to an API, Mediator adds the content type specified here before sending the request to the native service.

Examples for content types: application/json,
application/xml

Policy Enforcement Actions

Policy Enforcement is the process of enforcing the adherence to real-time policy compliance identifying/authenticating, monitoring, auditing, and measuring and collecting result statistics for an API.

Mediator provides the following categories of policy enforcement actions:

- ["Authentication Actions" on page 370](#)
- ["JMS Routing Actions" on page 370](#)
- ["Logging and Monitoring Actions" on page 371](#)
- ["Routing Actions" on page 371](#)
- ["Security Actions" on page 372](#)
- ["Traffic Management Action" on page 374](#)
- ["Validate Schema" on page 457](#)

Authentication Actions

Authentication actions verify that the API client has the proper credentials to access an API.

HTTP Basic Authentication	Uses HTTP basic authentication to verify the client's authentication credentials contained in the request's Authorization header against the Integration Server's user account.
NTLM Authentication	Uses NTLM authentication to verify the client's authentication credentials contained in the request's Authorization header against the Integration Server's user account.
OAuth2 Authentication	Uses OAuth2 authentication to verify the client's authentication credentials contained in the request's Authorization header against the Integration Server's user account.

JMS Routing Actions

JMS Routing actions route the incoming message to an API over JMS. For example, to a JMS queue where an API can then retrieve the message asynchronously.

JMS Routing Rule	Specifies a JMS queue to which the Mediator is to submit the request, and the destination to which the native API is to return the response.
Set Message Properties	Specifies JMS message properties to authenticate client requests before submitting to the native APIs.
Set JMS Headers	Specifies JMS headers to authenticate client requests before submitting to the native APIs.

Logging and Monitoring Actions

Logging and Monitoring actions monitor and collect information about the number of messages that were processed successfully or failed, the average execution time of message processing, and the number of alerts associated with an API.

Log Invocation	Logs request/response payloads to a destination you specify.
Monitor Service Level Agreement	Specifies a Service Level Agreement (SLA), which is set of conditions that define the level of performance that a specified client should expect from an API.
Monitor Service Performance	This action provides the same functionality as Monitor Service Level Agreement but this action is different because it enables you to monitor the API's run-time performance for all clients. This action monitors a user-specified set of run-time performance conditions for an API, and sends alerts to a specified destination when these performance conditions are violated.

Routing Actions

Routing actions route the incoming message (e.g., directly to the API, or routed according to the routing rules, or routed to a pool of servers for the purpose of load balancing and failover handling).

Straight Through Routing	Routes the requests directly to a native endpoint that you specify.
Context Based Routing	Route requests to different endpoints based on specific values that appear in the request message.

Content Based Routing	Route requests to different endpoints based on specific criteria that you specify.
Load Balancing and Failover Routing	Routes the requests across multiple endpoints.
Set Custom Headers	Specifies the HTTP headers to process the requests.

Security Actions

Security actions provide client validation (through WSS X.509 certificates, WSS username tokens etc.), confidentiality (through encryption) and integrity (through signatures) for request and response messages.

For the client validation, Mediator maintains a list of consumer applications specified in CentraSite that are authorized to access the API published to Mediator. Mediator synchronizes this list of consumer applications through a manual process initiated from CentraSite.

Generally speaking there are two different lists of consumers in the Mediator:

■ **List of Registered Consumers**

List of users and consumer applications (represented as Application assets) who are registered as consumers for the API in CentraSite, and available in the Mediator.

■ **List of Global Consumers**

List of all users and consumer applications (represented as consumers) available in the Mediator.

Mediator provides “Evaluate” actions that you can include in a message flow to identify and/or validate clients, and then configure their parameters to suit your needs. You use these “Evaluate” actions to perform the following actions:

- Identify the clients who are trying to access the APIs (through IP address or hostname).
- Validate the client's credentials.

Evaluate Client Certificate for SSL Connectivity	Mediator validates the client's certificate that the client submits to the API in CentraSite. The client certificate that is used to identify the client is supplied by the client to the Mediator during the SSL handshake over the transport layer.
---	---

Evaluate Hostname	<ul style="list-style-type: none"> ■ Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator).
--------------------------	--

-
- Mediator will try to validate the client's hostname against the specified list of consumers in the Integration Server on which Mediator is running.
- Evaluate HTTP Basic Authentication**
- Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator).
 - Mediator will try to validate the client's authentication credentials contained in the request's Authorization header against the specified list of consumers in the Integration Server on which Mediator is running.
- Evaluate IP Address**
- Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator).
 - Mediator will try to validate the client's IP address against the specified list of consumers in the Integration Server on which Mediator is running.
- Evaluate OAuth2 Token**
- Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator).
 - Mediator will try to validate the client's OAuth access token against the specified list of consumers in the Integration Server on which Mediator is running.
- Evaluate WSS Username Token**
- Applicable only for SOAP APIs.*
- Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator).
 - Mediator will try to validate the client's WSS username token against the specified list of consumers in the Integration Server on which Mediator is running.
- Evaluate WSS X.509 Certificate**
- Applicable only for SOAP APIs.*
- Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator).

	<ul style="list-style-type: none"> ■ Mediator will try to validate the client's WSS X.509 token against the specified list of consumers in the Integration Server on which Mediator is running.
Evaluate XPath Expression	<ul style="list-style-type: none"> ■ Mediator will try to identify the client against either the Registered Consumers list (the list of registered consumers in Mediator) or the Global Consumers list (the list of available consumers in Mediator). ■ Mediator will try to validate the client's XPath expression against the specified list of consumers in the Integration Server on which Mediator is running.
Require Encryption	<p><i>Applicable only for SOAP APIs.</i></p> <p>Requires that a request's XML element (which is represented by an XPath expression) be encrypted.</p>
Require Signing	<p><i>Applicable only for SOAP APIs.</i></p> <p>Requires that a request's XML element (which is represented by an XPath expression) be signed.</p>
Require SSL	<p><i>Applicable only for SOAP APIs.</i></p> <p>Requires that requests be sent via SSL client certificates.</p>
Require Timestamps	<p><i>Applicable only for SOAP APIs.</i></p> <p>Requires that timestamps be included in the request header. Mediator checks the timestamp value against the current time to ensure that the request is not an old message. This serves to protect your system against attempts at message tampering, such as replay attacks.</p>
Require WSS SAML Token	<p><i>Applicable only for SOAP APIs.</i></p> <p>Uses a WSS Security Assertion Markup Language (SAML) assertion token to validate API clients.</p>
Traffic Management Action	
Throttling Traffic Optimization	<p>Limits the number of service invocations during a specified time interval, and sends alerts to a specified destination when the performance conditions are violated. You can use this action to avoid overloading the back-end services and their infrastructure, to limit specific clients in terms of resource usage, etc.</p>

Service Result Cache Enables caching of the results of SOAP and REST API invocations.

Validation Action

Validate Schema Validates all XML request and/or response messages against an XML schema referenced in the WSDL.

Response Handling Actions

Response Handling is the process of transforming the response message coming from the native API into the custom format as expected by the client.

Response Transformation Invokes an XSL transformation in the response payloads from XML format to the format required by the client.

Invoke webMethods Integration Server Invokes a webMethods Integration Server service to process the response from the native API before it is returned to the client.

Set Media Type Specifies the content type for a REST response. This action is applicable only if **Enable REST Support** is set in Request Handling step. If a native service response (both for a REST API and SOAP API exposed as REST) does not contain a content type header, Mediator adds the content type specified here before sending the response to the client.

Examples for content types: `application/json`,
`application/xml`

Error Handling Action

Error Handling is the process of passing an exception message which has been issued as a result of a run-time error to take any necessary actions.

Conditional Error Processing Returns a custom error message (and/or the native provider's service fault content) to the client when the native provider returns a service fault.

The `watt.server.auth.skipForMediator` Property

This property specifies whether Integration Server authenticates requests for Mediator. You must set this property to true.

No request to Mediator should be authenticated by Integration Server. Instead, authentication should be handled by Mediator. Thus, to enable Mediator to authenticate requests, you must set `skipForMediator` to true (by default it is false).

When this parameter is set to true, Integration Server skips authentication for Mediator requests and allows the user credentials (of any type) to pass through so that Mediator can authenticate them. If you change the setting of this parameter, you must restart Integration Server for the changes to take effect.

To set `skipForMediator` to true

1. In the Integration Server Administrator, click **Settings > Extended**.
2. Click **Show and Hide Keys**.

Look for the `watt.server.auth.skipForMediator` property and ensure it is set to true.

3. If the `watt.server.auth.skipForMediator` property is not present, add it as follows:
 - a. Click **Edit Extended Settings**.
 - b. Type `watt.server.auth.skipForMediator=true` on a separate line.
 - c. Click **Save**.
 - d. Restart Integration Server.

Effective Policies

When you publish an API to Mediator, CentraSite automatically validates the API's policy enforcement workflow to ensure that:

CentraSite will inform you of any violation, and you will need to correct the violations before publishing the API.

When you publish an API to Mediator, CentraSite combines the actions specified within the proxy API's enforcement definition, and generates what is called the effective policy for the API. For example, suppose your API is configured with two run-time actions: one that performs a logging action and another that performs a security action. When you publish the API, CentraSite automatically combines the two actions into one effective policy. The effective policy, which contains both the logging action and the security action, is the policy that CentraSite actually publishes to Mediator with the API.

When CentraSite generates the effective policy, it validates the resulting action list to ensure that:

- Any action that appears in a single message flow multiple times is allowed to appear multiple times.

For those actions that can appear in a message flow only once (for example, Evaluate IP Address), Mediator will choose only one, which might cause problems or unintended results.

- All action dependencies are properly met. That is, some actions must be used in conjunction with another particular action.

If the list contains conflicts or inconsistencies, CentraSite resolves them according to Policy Resolution Rules.

The effective policy that CentraSite produces for an API is contained in an object called a virtual service definition (VSD). The VSD is given to Mediator when you publish the API. After you publish an API to Mediator, you can view its VSD (and thus examine the effective policy that CentraSite generated for it) from the Mediator user interface.

The following table shows:

- Action is WS-Security Policy 1.2 compliant.
- Action dependencies, that is, whether an action must be used in conjunction with another particular action.
- Action exclusives, that is, whether an action cannot be used in conjunction with another particular action.
- Action occurrences, that is, whether an action can occur once or multiple times within a message flow stage. An action can occur multiple times in a policy if the selection criteria is combined using an AND operator (not an OR operator).

Usage Cases for Identifying/Authenticating Clients

When deciding which type of identifier to use to identify a client, consider the following points:

- Whatever identifier you choose to identify a client, it must be unique to the application. Identifiers that represent user names are often not suitable because the identified users might submit requests for multiple APIs.

- Identifying applications by IP address or host name is often a suitable choice, however, it does create a dependency on the network infrastructure. If a client moves to a new machine, or its IP address changes, you must update the identifiers in the application asset.
- Using X.509 certificates or a custom token that is extracted from the SOAP message itself (using an XPATH expression), is often the most trouble-free way to identify a client.

Following are some common combinations of actions used to authenticate/identify clients.

- **Scenario 1: Identify clients by IP address or host name**

- The simplest way to identify clients is to use the ["Evaluate IP Address" on page 407](#) action.

- **Scenario 2: Authenticate clients by HTTP authentication token**

Use the following actions:

- ["Evaluate HTTP Basic Authentication" on page 405](#) to identify clients using the token derived from the HTTP Header.
 - ["HTTP Basic Authentication" on page 413](#).

- **Scenario 3: Authenticate clients by WS-Security authentication token**

Use the following action:

- ["Evaluate WSS Username Token" on page 409](#) action to identify clients using the token derived from the WSS Header.

- **Scenario 4: Authenticate clients by WSS X.509 certificate**

- ["Evaluate WSS X.509 Certificate" on page 410](#) action to identify clients using the WSS X.509 certificate.
 - ["Require SSL" on page 441](#) action.

Run-Time Actions Reference

This section provides an alphabetic list of the built-in run-time actions you can include in the run-time governance rules for APIs.

Allow Anonymous Usage

When an API is not configured with any of the **Security** policy actions, Mediator routes the incoming requests directly to the native API, irrespective of the client credentials passed in the request.

When an API is configured with a **Security** policy action, Mediator routes the incoming requests to the native API that are successfully identified using the client credentials passed in the request. When this API is also configured with the Allow Anonymous

Usage policy action, Mediator routes all of the incoming requests to the native API. However, the successfully identified requests are grouped under the respective identified consumer, and all unidentified requests are grouped under a common consumer named as unknown.

With this action, you can perform the following list of consumer-specific actions, while also allowing the requests to pass through to the native API:

- View the runtime events for a particular consumer.
- Monitor the Service Level Agreement for a few consumers and send an alert email based on specific criteria's, for example, request count, availability, and so on.
- Throttle requests from a particular consumer, and restrict requests from that consumer if the number of requests to the API reaches the configured hard limit during a specified period of time.

Input Parameters

Allow Anonymous Usage (Boolean). Specifies whether to allow all the incoming requests to access the API, without restriction.

Value	Description
True	(Default). Allows all of the incoming requests to access an API even if the request is not identified using the Security policies that are configured for that API.
False	Allows only the incoming requests that are identified using the configured Security policies to access the API.

Content Based Routing

If you have a native API that is hosted at two or more endpoints, you can use the Content Based Routing to route specific types of messages to specific endpoints.

You can route messages to different endpoints based on specific values that appear in the request message.

When this action is configured for a proxy API, the requests are routed according to the routing rules you create. That is, they are routed based on the successful evaluation of one or more XPath expressions that are constructed utilizing the content of the request payload. For example, a routing rule might allow requests for half of the methods of a particular service to be routed to Endpoint A, and the remaining methods to be routed to Endpoint B.

Input Parameters

Route To *URI. Mandatory.* Enter the URL of the native API endpoint to route the request to in case all routing rules evaluate to False. For example:

```
http://mycontainer/creditCheckService
```

Click the **Configure Endpoint Properties**  icon (next to the **Route To** field) if you want to configure a set of properties for the specified endpoint.

Alternatively, Mediator offers "Local Optimization" capability if the native endpoint is hosted on the same Integration Server as Mediator. With local optimization, API invocation happens in-memory and not through a network hop.

Specify the native API in either of the following forms:

```
local://<Service-full-path>
```

OR

```
local://<server>:<port>/ws/<Service-full-path>
```

For example:

```
local://MyAPIFolder:MyLocalAPI
```

which points to the endpoint API `MyLocalAPI` which is present under the folder `MyAPIFolder` in Integration Server.

Note: Local Optimization is not applicable to REST based APIs.

Add Routing Rule button

Click the **Add Routing Rule** button and complete the **Add Routing Rule** dialog box as follows.

1. In the **XPath Expression** field, specify an argument to evaluate the XPath expression contained in the request.
2. To add a custom **Namespace**, specify a name and value for the namespace in the **Prefix** and **URI** fields. If you need to add additional rows, use the plus button.
3. In the **Route To** field, specify the URL of the native API to route the request to, if the rule criteria are met.
4. Click the **Configure Endpoint Properties**  icon (next to the **Route To** field) if you want to configure a set of properties for the specified endpoint individually.
5. Click **OK**.

Configure
Endpoint
Properties
icon 

Optional. This icon displays the **Endpoint Properties** dialog box that enables you to configure a set of properties for the Mediator to route incoming requests to the native API as follows:

SOAP
Optimization
Method

Only for SOAP-Based APIs. Mediator can use the following optimization methods to parse SOAP requests to the native API:

<u>Value</u>	<u>Description</u>
MTOM	Mediator will use the Message Transmission Optimization Mechanism (MTOM) to parse SOAP requests to the API.
SwA	Mediator will use the SOAP with Attachment (SwA) technique to parse SOAP requests to the API.
None	<i>Default.</i> Mediator will not use any optimization method to parse the SOAP requests to the API.

Note:Keep the following in mind:

- Bridging between SwA and MTOM is not supported. If a client sends a SwA request, Mediator can only forward SwA to the native API. The same is true for MTOM, and applies to responses received from the native API. That is, a SwA or MTOM response received by Mediator from a native API will be forwarded to the client using the same format it received.
- When sending SOAP requests that do not contain a MTOM or SWA attachment to a native API that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related'. This is necessary so Mediator knows how to parse the response properly.

HTTP Connection Timeout	<i>Number.Optional.</i> The time interval (in seconds) after which a connection attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the <code>Connection Timeout</code> field (in the Integration Server Administrator, go to Settings > Extended). <i>Default:</i> 30 seconds.
Read Timeout	<i>Number.Optional.</i> The time interval (in seconds) after which a socket read attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the <code>Read Timeout</code> field (in the Integration Server Administrator, go to Settings > Extended). <i>Default:</i> 30 seconds.
SSL Configuration	<i>Optional.</i> To enable SSL client authentication that Mediator will use to authenticate incoming requests for the native API, you must specify values for both the <code>Client Certificate Alias</code> field and the <code>IS Keystore Alias</code> field. If you specify a value for only one of these fields, a deployment error will occur.

Note: SSL client authentication is optional; you may leave both fields blank.

Prerequisite: You must set up the key alias and keystore properties in the Integration Server. For the procedure, see *webMethods Integration Server Administrator's Guide*.

You will use these properties to specify the following fields:

<u>Value</u>	<u>Description</u>
Client Certificate Alias	<i>Mandatory.</i> The client's private key to be used for performing SSL client authentication.
IS Keystore Alias	<i>Mandatory.</i> The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of <code>Client Certificate Alias</code>) will be used

for performing SSL client authentication.

WS Security Header

Only for SOAP-Based APIs. Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native API.

<u>Value</u>	<u>Description</u>
Remove processed security headers	Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the API's security run-time action). Note that Mediator will not remove the security header if both of the following conditions are true: 1) Mediator did not process the security header, and 2) the <code>mustUnderstand</code> attribute of the security header is 0/false).
Pass all security headers	<i>Default.</i> Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the API's security action).

Context Based Routing

If you have a native API that is hosted at two or more endpoints, you can use the Context Based Routing to route specific types of messages to specific endpoints.

When this action is configured for a proxy API, the requests are routed according to the routing rules you create. A routing rule specifies where requests should be routed, and the criteria by which they should be routed there. For example, requests can be routed according to certain clients, certain dates/times, or according to requests that exceed/fall below a specified metric (Total Count, Success Count, Fault Count, etc.). You can create one or more rules.

Input Parameters

Default Route To *URI. Mandatory.* Enter the URL of the native API endpoint to route the request to in case all routing rules evaluate to False. For example:

`http://mycontainer/creditCheckService`

Click the **Configure Endpoint Properties**  icon (next to the **Route To** field) if you want to configure a set of properties for the specified endpoint.

Alternatively, Mediator offers "Local Optimization" capability if the native endpoint is hosted on the same Integration Server as Mediator. With local optimization, API invocation happens in-memory and not through a network hop.

Specify the native API in either of the following forms:

`local://<Service-full-path>`

OR

`local://<server>:<port>/ws/<Service-full-path>`

For example:

`local://MyAPIFolder:MyLocalAPI`

which points to the endpoint API `MyLocalAPI` which is present under the folder `MyAPIFolder` in Integration Server.

Note: Local Optimization is not applicable to REST based APIs.

Add
Routing
Rule button

Click the **Add Routing Rule** button and complete the **Add Routing Rule** dialog box as follows.

1. In the **Name** field, specify a name for the routing rule.
2. In the **Condition** panel, specify the following as required:
 - a. In the **Variable** column, select **Time**, **IP Address Range**, **Date**, **Consumer**, **Predefined Context Variable** or **Custom Context Variable**.
 - b. In the **Value** column, specify an applicable value. For **Date** choose **Before**, **After** or **Equal To** and enter a date. For **Time** choose **Before** or **After** and enter a time. For **IP Address**, enter numeric values for **Between** and **And**. For **Consumer**, enter a consumer application name in the text box. For **Predefined Context Variable** or **Custom Context Variable**, choose the **String** or **Integer** data type. Select a predefined variable name or custom variable name from the drop-down list. For **String**, choose **Equal To** or **Not Equal To** and enter a value. For **Integer**, choose **Greater Than**, **Less Than**, **Not Equal To**, **Equal To** or and enter a value.

Note: Keep the following in mind:

- For the list of the predefined context variables, see *Using Context Variables in APIs*.

- The predefined context variable `PROTOCOL_HEADER` is not available in the drop-down list; to include `PROTOCOL_HEADER` in the rule, define the variable as Custom Context Variable.
- If you define a custom context variable in the routing rule, you must write a *webMethods IS service* and invoke it in the API's Context Based Routing action. In this Integration Server service, use the API to get/set the custom context variable. .

For more information, see ["The API for Context Variables" on page 265](#)

If you need to specify multiple variables, use the plus button to add rows.

- c. If you have more than one routing rule, choose an operator for the expression: **AND** or **OR** (the default).
3. In the **Route To** field, specify the URL of the native API endpoint to route the request to, if the rule criteria are met.
4. Click the **Configure Endpoint Properties**  icon (next to the **Route To** field) if you want to configure a set of properties for the specified endpoint individually.
5. Click **OK**.

Configure
Endpoint
Properties 
icon

Optional. This icon displays the **Endpoint Properties** dialog box that enables you to configure a set of properties for the Mediator to route incoming requests to the native API as follows:

SOAP
Optimization
Method

Only for SOAP-Based APIs. Mediator can use the following optimization methods to parse SOAP requests to the native API:

<u>Value</u>	<u>Description</u>
MTOM	Mediator will use the Message Transmission Optimization Mechanism (MTOM) to parse SOAP requests to the API.
SwA	Mediator will use the SOAP with Attachment (SwA) technique to parse SOAP requests to the API.

None *Default.* Mediator will not use any optimization method to parse the SOAP requests to the API.

Note: Keep the following in mind:

- Bridging between SwA and MTOM is not supported. If a client sends a SwA request, Mediator can only forward SwA to the native API. The same is true for MTOM, and applies to responses received from the native API. That is, a SwA or MTOM response received by Mediator from a native API will be forwarded to the client using the same format it received.
- When sending SOAP requests that do not contain a MTOM or SWA attachment to a native API that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related'. This is necessary so Mediator knows how to parse the response properly.

HTTP
Connection
Timeout

Number.Optional. The time interval (in seconds) after which a connection attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the `Connection Timeout` field (in the Integration Server Administrator, go to **Settings > Extended**). *Default:* 30 seconds.

Read
Timeout

Number.Optional. The time interval (in seconds) after which a socket read attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the `Read Timeout` field (in the Integration Server Administrator, go to **> Settings > Extended**.). *Default:* 30 seconds.

SSL
Configuration

Optional. To enable SSL client authentication that Mediator will use to authenticate incoming requests for the native API, you must specify values for both the Client Certificate Alias field and the IS Keystore Alias field. If you specify a value for only one of these fields, a deployment error will occur.

Note: SSL client authentication is optional; you may leave both fields blank.

Prerequisite: You must set up the key alias and keystore properties in the Integration Server. For the procedure, see *webMethods Integration Server Administrator's Guide*.

You will use these properties to specify the following fields:

<u>Value</u>	<u>Description</u>
Client Certificate Alias	<i>Mandatory.</i> The client's private key to be used for performing SSL client authentication.
IS Keystore Alias	<i>Mandatory.</i> The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) will be used for performing SSL client authentication.

WS Security Header

Only for SOAP-Based APIs. Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native API.

<u>Value</u>	<u>Description</u>
Remove processed security headers	<i>Default.</i> Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the API's security run-time action). Note that Mediator will not remove the security header if both of the following conditions are true: 1) Mediator did not process the security header, and 2) the <code>mustUnderstand</code> attribute of the security header is 0/ false).
Pass all security headers	Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the API's security action).

Conditional Error Processing

This action returns a custom error response (and/or the native provider's service fault content) to the client when the native provider returns a service fault. You can configure conditional error processing and use variables to create custom error messages. This action also allows you to define error messages based on content types: text, XML, and JSON.

Alternatively, you can configure global error responses for all APIs, using Mediator's Service Fault Configuration page (see *Administering webMethods Mediator*).

Note: To enable support for conditional error processing in CentraSite, you must add an entry in the custom\conf\centrasite.xml file as follows: `<Action name="ConditionalErrorProcessing" id="uddi:61849291-3bad-4612-819b-5fe5a6b4e958" occurrence="*"></Action>`. For details on configuring the centrasite.xml file, see CentraSite documentation.

Input Parameters

Error Conditions Specifies the error conditions and how each of these error conditions are to be processed. You can define a maximum of three conditions. You can configure only one error condition per type. For example, you cannot define two status code conditions. To specify multiple conditions, use the  button to add rows.

Type	Value	Description
	Status Code	<i>Default</i> Specify the error status code. For example: 400, 500.
	HTTP Header	Specify the details of the custom HTTP header(s) included in the client requests. The parameters are: <ul style="list-style-type: none"> ■ HTTP Name<i>String</i>. Specifies the name of the HTTP header. ■ HTTP Value<i>String</i>. Specifies the value of the HTTP header.
	XPath Expression	Specifies the details of the XPath expression in the API request. The parameters are: <ul style="list-style-type: none"> ■ XPath Expression

- **Namespaces** Specifies the namespace of the XPath expression. To specify multiple XPath expressions, use the  button to add rows.
 - **Prefix** The prefix for the namespace. For example, `soapenv` or `axis`
 - **URI** The namespace URI
 - For example, `http://schemas.xmlsoap.org/soap/envelope/` or `http://ws.apache.org/axis`
- **Value** Specifies the value of the XPath expression.

Pre-
Processing

Specifies how the native service error response is to be processed before sending the same to Mediator. You can configure multiple ESB and XSLT processing steps. You can either log the error message sent by the native service without any changes or you can remove any critical information that you do not want Mediator to log or send to the client. The processing of these steps is taken up in the order in which they are configured.

Value	Description
XSLT	<i>String.Optional.</i> Specify the XSLT file that you want to use to transform the service error response. Use the Choose button to browse to and select a file.
ESB	<i>DefaultString.Optional.</i> Specify the webMethods IS Service . Invokes one or more webMethods IS services to manipulate the response message from the native API before it is returned to the consuming application. The IS service will have access to the response message context (the axis2 MessageContext instance) before it is updated with the custom error message. For example, you might want to send emails or perform custom alerts based on the response payload.

Failure
Message

String. Specify the custom failure message that Mediator should send to the client. You can configure an error template each for the content types: Text, XML, and JSON. For addition details, see the fault handler variables listed in the table below. For example, `$CONSUMER_APPLICATION $OPERATION :$ERROR_MESSAGE`.

<u>Value</u>	<u>Description</u>
Content-Type	<p>Specifies the content type for which the failure message is defined. You can select the following content types:</p> <ul style="list-style-type: none"> ■ text ■ xml ■ json <p>NoteYou can define only one error template per content type.</p>
Error Template	Specifies the content of the error template to use. You can use predefined fault handler variables to create the error template. A list of the predefined variables is available in the table below.
Use as Default	Specifies the error template to use as the default.

Custom Error
Variables

Specify the error variables to be used in the custom error message. To specify multiple error variables, use the  button to add rows.

Payload Type	Select the payload type.
<u>Value</u>	<u>Description</u>
Request	Selects the request payload type.
Response	Selects the response payload type.
Name	
XPath Expression	Specifies the details of the XPath expression in the API request.

	Namespaces	Specifies the namespace of the XPath expression. To specify multiple namespaces , use the  button to add rows.
	Prefix	The prefix for the namespace.
	URI	The namespace URI.
Post-Processing	You can configure multiple ESB and XSLT processing steps. You can either log the error message sent by the native service without any changes or you can remove any critical information that you do not want Mediator to log or send to the client. The processing of these steps is taken up in the order in which they are configured.	
	Value	Description
	XSLT	<i>String.Optional.</i> Specify the XSLT file that you want to use to transform the service error response. Use the Choose button to browse to and select a file.
	ESB	<i>DefaultString.Optional.</i> Specify the webMethods IS Service . Invokes one or more webMethods IS services to manipulate the API fault after the Conditional Error Processing action is invoked. The IS service will have access to the entire API fault and the Conditional Error Processing message. You can make further changes to the fault message structure, if needed.
Send Native Provider Fault Message	When the parameter is enabled, Mediator sends the native SOAP / REST failure message to the client. When you enable this parameter, the <code>Failure Message</code> is ignored when a fault is returned by the native API provider. (Faults returned by internal Mediator exceptions will still be handled by the <code>Failure Message</code> .)	

Failure Messages

The failure message is returned in both of the following cases:

- When a failure is returned by the native API provider.

In this case, the `$ERROR_MESSAGE` variable in the failure message will contain the message produced by the provider's exception that caused the error. This is equivalent to the `getMessage` call on the Java Exception.

- When a failure is returned by internal Mediator exceptions (such as policy violation errors, timeouts, etc.).

In this case, `$ERROR_MESSAGE` will contain the error message generated by Mediator.

Alternatively, you can configure global failure messages for *all* APIs, using Mediator's Service Fault Configuration page, as described in *Administering webMethods Mediator*.

Mediator returns the following failure message to the consuming application:

```
Mediator encountered an error:$ERROR_MESSAGE while executing
operation:$OPERATION service:$SERVICE at time:$TIME on date:$DATE.
The client ip was:$CLIENT_IP. The current user:$USER.
The consumer application:$CONSUMER_APPLICATION".
```

The precedence of the Failure Message configurations is as follows:

- If you configure a Conditional Error Processing action for an API, the failure message configurations take precedence over any settings on the global Service Fault Configuration page.
- If you do not configure a Conditional Error Processing action for an API, the settings on the Service Fault Configuration page take precedence.

The default failure message contains predefined fault handler variables (`$ERROR_MESSAGE`, `$OPERATION`, etc.) which are described in the table below.

You can customize the default failure message using the following substitution variables, where Mediator replaces the variable reference with the real content at run time:

- The predefined context variables listed in "[The Predefined Context Variables](#)" on page 260.
- Custom context variables that you declare using Mediator's API (see "[The API for Context Variables](#)" on page 265).

Note: If you want to reference a custom context variable that you have already defined in a virtual API (as opposed to one you have "[Using Context Variables in Virtual Services](#)" on page 259), you must add the prefix `$mx` to the variable name in order to reference the variable. For example, if you defined the variable `TAXID`, you would reference it as `$mx:TAXID`.

The fault handler variables are described below.

Note: If no value is defined for a fault handler variable, then the returned value will be the literal string "null". For example, `$CONSUMER_APPLICATION` will always be "null" if the service's policy does not contain at least one of the "Evaluate" actions.

Fault Handler Variable	Description
\$ERROR_MESSAGE	The error message produced by the exception that is causing the error. This is equivalent to the getMessage call on the Java Exception. This maps to the faultString element for SOAP 1.1 or the Reason element for SOAP 1.2 catch.
\$OPERATION	The operation that was invoked when this error occurred.
\$SERVICE	The service that was invoked when this error occurred.
\$TIME	The time (as determined on the Container side) at which the error occurred.
\$DATE	The date (as determined on the Container side) at which the error occurred.
\$CLIENT_IP	The IP address of the client invoking the service. This might be available for only certain invoking protocols, such as HTTP(S).
\$USER	The currently authenticated user. The user will be present only if the Transport/SOAP Message have user credentials.
\$CONSUMER_APPLICATION	The currently identified consumer application (client).
\$NATIVE_STATUS_CODE	The HTTP error status code that is returned by the native service.

Evaluate Client Certificate for SSL Connectivity

If you have a native API that requires to authenticate a client to the Integration Server using the Secure Sockets Layer (SSL) client authentication, you can use the Evaluate Client Certificate action to extract the client's identity certificate, and verify the client's identity (certificate-based authentication).

This form of authentication does not occur at the message layer using a user ID and password or tokens. This authentication occurs during the connection handshake using SSL certificates.

This action extracts the client identity certificate supplied by the client to the Mediator during the SSL handshake over the Transport layer. For example, when you have

configured this action for a proxy API, the PEP extracts the certificate from the Transport layer. In order to identify clients by transport-level certificates, the run-time communication between the client and the Mediator must be over HTTPS and the client must pass a valid certificate.

To use this action, the following prerequisites must be met:

- In Integration Server, create a keystore and truststore, as described in *webMethods Integration Server Administrator's Guide*.
- In Integration Server, create an HTTPS port as described in the *webMethods Integration Server Administrator's Guide*.
- Configure Mediator by setting the HTTPS Ports Configuration parameter, as described in *Administering webMethods Mediator*.

Mediator rejects requests that do not include a client certificate during the SSL handshake over the Transport layer.

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

Identify Consumer *String*. The list of consumers against which the client certificate should be validated for identifying requests from a particular client.

Value	Description
Registered Consumers	Mediator will try to verify the client identify certificate against the list of consumer applications who are registered as consumers for the specified API.
Global Consumers	<i>Default.</i> Mediator will try to verify the client identify certificate against a list of all global consumers available in the Mediator.

Evaluate Hostname

If you have a native API that requires to authenticate a client to the Integration Server using the hostname, you can use the Evaluate Hostname action to extract the client's hostname from the HTTP request header, and verify the client's identity.

This action extracts the specified hostname from an incoming request and locates the client defined by that hostname. For example, when you have configured this action for an API, the PEP extracts the hostname from the request's HTTP header at run time and searches its list of consumers for the client defined by the hostname.

Mediator will evaluate the incoming request to identify and validate that the client's request originated from a particular host machine.

Mediator rejects requests that do not include the hostname of an Integration Server user.

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

`Identify Consumer` *String*. The list of consumers against which the hostname should be validated for identifying requests from a particular client.

<u>Value</u>	<u>Description</u>
<code>Registered Consumers</code>	Mediator will try to verify the client's hostname against the list of consumer applications who are registered as consumers for the specified API.
<code>Global Consumers</code>	<i>Default</i> . Mediator will try to verify the client's hostname against a list of all global consumers available in the Mediator.

Evaluate HTTP Basic Authentication

If you have a native API that requires to authenticate a client to the Integration Server using the HTTP Basic Authentication, you can use the Evaluate HTTP Basic Authentication action to extract the client's credentials (user ID and password) from the Authorization request header, and verify the client's identity.

This action uses HTTP Basic authentication to verify the client's authentication credentials contained in the request's Authorization header. When this action is configured for an API, Mediator validates the credentials against the list of consumers available in the Integration Server on which Mediator is running. If you have chosen the checkbox `Authenticate User using the HTTP Basic Authentication`, this type of client authentication is referred to as "preemptive authentication".

If the user/password value in the Authorization header cannot be authenticated as a valid Integration Server user (or if the Authorization header is not present in the request), a 500 SOAP fault is returned, and the client is presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated. This type of client authentication is referred to as "non-preemptive authentication". If the client does not successfully respond to the challenge, a 401 "WWW-Authenticate: Basic" response is returned and the invocation is not routed to the policy engine.

If you choose to omit the `Authenticate User` parameter (and regardless of whether an Authorization header is present in the request or not), then Mediator forwards the request to the native API, without attempting to authenticate the request.

In the case where a client sends a request with transport credentials (HTTP Basic Authentication) and message credentials (WSS Username Token or WSS X.509 Token), the message credentials take precedence over the transport credentials when Integration Server determines which credentials it should use for the session. For more information, see ["Evaluate WSS Username Token" on page 409](#) and ["Evaluate WSS X.509 Certificate" on page 410](#).

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

`Identify Consumer` *String*. The list of consumers against which authentication credentials (user ID and password) should be validated for identifying requests from a particular client.

Value	Description
Registered Consumers	Mediator will try to verify the client's credentials against the list of consumer applications who are registered as consumers for the specified API.
Global Consumers	<i>Default.</i> Mediator will try to verify the client's credentials against a list of all global consumers available in the Mediator.
Do Not Identify	Mediator forwards the request to the native API, without attempting to verify client's credentials in incoming request.

`Authenticate User` Use this checkbox to specify the users who can access the APIs. If you select the checkbox, Mediator allows only the users specified in the `Identify Consumer` parameter to access the APIs. If you do not select the checkbox, Mediator allows all users to access the API. In this case, do not configure the `Identify Consumer` parameter.

Note: If you have selected the `Authenticate User` option, the client that connects to the API must have an Integration Server user account.

Evaluate IP Address

If you have a native API that requires to authenticate a client to the Integration Server using the IP address, you can use the Evaluate IP Address action to extract the client's IP address from the HTTP request header, and verify the client's identity.

This action extracts the specified IP address from an incoming request and locates the client defined by that IP address. For example, when you have configured this action for a proxy API, the PEP extracts the IP address from the request's HTTP header at run time and searches its list of consumers for the client defined by the IP address.

Mediator will evaluate the incoming request to identify and validate that the client's request originated from a particular IP address.

Mediator rejects requests that do not include the IP address of an Integration Server user.

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

Identify
Consumer

String. The list of consumers against which the IP address should be validated for identifying requests from a particular client.

<u>Value</u>	<u>Description</u>
Registered Consumers	Mediator will try to verify the client's credentials against the list of consumer applications who are registered as consumers for the specified API. Mediator will evaluate whether the request header contains the X-Forwarded-For, which is used for identifying the IP address of a client through an HTTP proxy.
Global Consumers	<i>Default.</i> Mediator will try to verify the client's credentials against a list of all global consumers available in the Mediator.
Do Not Identify	Mediator forwards the request to the native API, without attempting to verify client's credentials in incoming request.

Evaluate OAuth2 Token

If you have a native API that requires to authenticate a client to the Integration Server using the OAuth 2.0 credentials (access token), you can use the Evaluate OAuth2 Authentication action to extract the client's credentials from the HTTP request header, and verify the client's identity.

This action extracts the specified OAuth access token from an incoming request and locates the client defined by that access token. For example, when you have configured this action for an API, the PEP extracts the OAuth access token from the request's HTTP header at run time and searches its list of consumers for the client that is defined by that access token.

Mediator will evaluate the incoming request to identify and validate that the client's access token.

Mediator rejects requests that do not include the OAuth access token of an Integration Server user.

Mediator supports OAuth2.0 using the grant type "Client Credentials".

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

Identify User *String.* The list of consumers against which the OAuth token should be validated for identifying requests from a particular client.

<u>Value</u>	<u>Description</u>
Registered Consumers	Mediator will try to verify the client's OAuth access token against the list of consumer applications who are registered as consumers for the specified API.
Global Consumers	<i>Default.</i> Mediator will try to verify the client's OAuth access token against a list of all global consumers available in the Mediator.

Validate Access Token *Boolean.Optional.* This option uses your resource server to verify clients. When Integration Server acts as a resource server, it receives requests from clients that include an access token. The resource server asks the authorization server to validate the access token and user. If the token is valid and the user has privileges to access the folders and services, the resource server executes the request.

For more information about using Integration Server to act as a resource server, see *webMethods Integration Server Administrator's Guide*.

Value	Description
True	Default. Mediator will verify the client's OAuth access token against the list of consumers available in the Integration Server on which Mediator is running.
False	Mediator will not verify the client's OAuth access token.

Evaluate WSS Username Token

If you have a native API that requires to authenticate a client to the Integration Server using the WS-Security authentication, you can use the Evaluate WSS Username Token action to extract the client's credentials (username token and password) from the WS-Security SOAP message header, and verify the client's identity.

This action extracts the username token and password supplied in the message header of the request and locates the client defined by that username token and password. For example, when you have configured this action for an API, the PEP extracts the username token and password from the SOAP header at run time and searches its list of consumers for the client that is defined by the credentials.

To use this action, the following prerequisites must be met:

- In Integration Server, create a keystore and truststore. For detailed information about securing communications with the server, see the *webMethods Integration Server Administrator's Guide*.
- In Integration Server, create an HTTPS port. For detailed information about configuring ports, see the *webMethods Integration Server Administrator's Guide*.
- Configure Mediator by setting the HTTPS Ports Configuration parameter. For detailed information about configuring Mediator, see *Administering webMethods Mediator*.

Mediator rejects requests that do not include the username token and password of an Integration Server user. Mediator only supports clear text passwords with this kind of authentication.

In the case where a client sends a request with transport credentials (HTTP Basic Authentication) and message credentials (WSS Username Token or WSS X.509 Certificate), the message credentials take precedence over the transport credentials when Integration Server determines which credentials it should use for the session. For more information, see ["Evaluate HTTP Basic Authentication" on page 405](#) and ["Evaluate WSS X.509 Certificate" on page 410](#).

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

Identify Consumer *String*. The list of consumers against which the username token and password should be validated for identifying requests from a particular client.

Value	Description
Registered Consumers	Mediator will try to verify the client's WSS username token against the list of consumer applications who are registered as consumers for the specified API.
Global Consumers	<i>Default</i> . Mediator will try to verify the client's WSS username token against a list of all global consumers available in the Mediator.
Do Not Identify	Mediator forwards the request to the native API, without attempting to verify the client's username token in incoming request.

Evaluate WSS X.509 Certificate

If you have a native API that requires to authenticate a client to the Integration Server using the WS-Security authentication, you can use the Evaluate WSS X.509 Certificate action to extract the client identity certificate from the WS-Security SOAP message header, and verify the client's identity.

This action extracts the certificate supplied in the header of an incoming SOAP request and locates the client defined by the information in that certificate. For example, when you have configured this action for an API, the PEP extracts the certificate from the SOAP header at run time and searches its list of consumers for the client that is defined by the certificate.

To use this action, the following prerequisites must be met:

- In Integration Server, create a keystore and truststore, as described in the *webMethods Integration Server Administrator's Guide*.
- In Integration Server, create an HTTPS port, as described in the *webMethods Integration Server Administrator's Guide*.
- Configure Mediator by setting the HTTPS Ports Configuration parameter, as described in *Administering webMethods Mediator*.

Mediator rejects requests that do not include the X.509 token of an Integration Server user.

In the case where a client sends a request with transport credentials (HTTP Basic Authentication) and message credentials (WSS Username Token or WSS X.509 Certificate), the message credentials take precedence over the transport credentials when Integration Server determines which credentials it should use for the session. For more information, see ["Evaluate WSS Username Token" on page 409](#) and ["Evaluate HTTP Basic Authentication" on page 405](#).

If Mediator cannot identify the client, Mediator fails the request and generates a Policy Violation event.

Input Parameters

Identify Consumer *String*. The list of consumers against which the X.509 certificate should be validated for identifying requests from a particular client.

<u>Value</u>	<u>Description</u>
Registered Consumers	Mediator will try to verify the client's X.509 certificate against the list of consumer applications who are registered as consumers for the specified API.
Global Consumers	<i>Default.</i> Mediator will try to verify the client's X.509 certificate against a list of all global consumers available in the Mediator.
Do Not Identify	Mediator forwards the request to the native API, without attempting to verify client's certificate in incoming request.

Evaluate XPath Expression

Note: This action does not support JSON-based REST APIs.

If you have an API which includes consumer authentication using XPath, you can use the Evaluate XPath Expression action to extract the custom identification credentials from the request. You can then verify the consumer's identity using this information.

The Evaluate XPath Expression action extracts the custom authentication credentials that is supplied in the request which is represented using an XPath expression. The custom authorization can be in the form of tokens, or a username and password token combination. For example, when you configure this action for an API, the PEP extracts the custom identification from the request using an XPath expression at runtime and

searches its list of consumers for the XPath defined in the global or registered consumers list.

Mediator rejects requests that do not include the XPath consumer identification defined in the global or registered consumers list.

If Mediator cannot identify the consumer, Mediator fails the request and generates a Policy Violation event.

Input Parameters

Identify Consumer *String.* The list of consumers against which the XPath expression should be validated for identifying requests from a particular client.

Value	Description
Registered Consumers	Mediator will try to verify the client's XPath expression against the list of consumer applications who are registered as consumers for the specified API.
Global Consumers	<i>Default.</i> Mediator will try to verify the client's XPath expression against a list of all global consumers available in the Mediator.
Do Not Identify	Mediator forwards the request to the native API, without attempting to verify client's XPath expression in incoming request.

Namespace *String.Optional.* The namespace of the XPath expression to be validated.

XPath Expression *String. Mandatory.* An argument to evaluate the XPath expression contained in the request. See the sample below.

Let's take a look at an example. For the following SOAP message:

```
<?xml version="1.0" encoding="UTF-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Header>
</soap:Header>
  <soap:Body>
    <catalog xmlns="http://www.store.com">
      <name>My Book</name>
      <author>ABC</author>
      <price>100</price>
    </catalog>
  </soap:Body>
</soap:Envelope>
```

The XPath expression is as follows:

```
/soap:Envelope/soap:Body/catalog/author
```

To select the element or token without the namespace, use the following:

```
//*[local-name()='Envelope']/*[local-name()='Body']/*[local-name()='catalog']/*[local-name()='author'][1]/text()
```

The result: SoftwareAG

HTTP Basic Authentication

This action uses the HTTP authentication mechanism to validate incoming requests from clients. Mediator authorizes the basic credentials (username and password) against a list of all global consumers available in the Mediator.

If the username/password value in the Authorization header cannot be authenticated as a valid Integration Server user (or if the Authorization header is not present in the request), a 500 SOAP fault is returned, and the client is presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated. If the client does not successfully respond to the challenge, a 401 “WWW-Authenticate: Basic” response is returned and the invocation is not routed to the policy engine. As a result, no events are recorded for that invocation, and its key performance indicator (KPI) data are not included in the performance metrics.

If none of the authentication actions ("[HTTP Basic Authentication](#)" on page 413, "[NTLM Authentication](#)" on page 431 or "[OAuth2 Authentication](#)" on page 433) is configured for a proxy API, Mediator forwards the request to the native API, without attempting to authenticate the request.

Input Parameters

Authenticate Using *String*. The user credentials for authenticating client requests to the native API.

<u>Value</u>	<u>Description</u>
Existing Credentials	<i>Default.</i> Mediator authenticates requests based on the credentials specified in the HTTP header. It passes the “Authorization” header present in the original client request to the native API.
Custom Credentials	Mediator authenticates requests according to the values you specify in the User , Password and Domain fields.

<u>Field</u>	<u>Description</u>
--------------	--------------------

Username	<i>String. Mandatory.</i> Account name of a consumer who is available in the Integration Server on which Mediator is running.
Password	<i>String. Mandatory.</i> A valid password of the consumer.
Domain	<i>String. Optional.</i> Domain used by the server to authenticate the consumer.

Invoke webMethods Integration Server

Specifically, you would need to configure the *Invoke webMethods Integration Server* action to:

- Pre-process the request messages into the format required by the native API, before Mediator sends the requests to the native APIs.
- Pre-process the native API's response messages into the format required by the clients, before Mediator returns the responses to the clients.

In some cases an API might need to process messages.

For example, you might need to accommodate differences between the message content that a client is capable of submitting and the message content that a native API expects. For example, if the client submits an order record using a slightly different structure than the structure expected by the native API, you can use this action to process the record submitted by the client to the structure required by the native API.

In the Request Handling sequence, this action invokes the webMethods IS service to pre-process the request received from the client and before it is submitted to the native API.

In the Response Processing sequence, this action invokes the webMethods IS service to process the response message received from the native API and before it is returned to the client.

Note: A webMethods IS service must be running on the same Integration Server as Mediator. It can call out a C++ or Java or .NET function. It can also call other Integration Server services to manipulate the message.

Input Parameters

webMethods IS Service	<p><i>String. Mandatory.</i> Enter a name for the webMethods IS Service. This service will be used to manipulate the request/response (the axis2 MessageContext instance).</p> <p>Mediator will pass to the invoked IS service the request message context (the axis2 MessageContext instance), which contains the request-specific information. Also, you can use the public IS services that accept MessageContext as input to manipulate the response contents.</p>
-----------------------	--

JMS Routing Rule

This action allows you to specify a JMS queue to which the Mediator is to submit the request, and the destination to which the native API is to return the response.

To use the JMS Routing Rule action, you publish multiple APIs for a single native API. For example, to make a particular native API available to clients over both HTTP and JMS, you would create two APIs for the native API: one that accepts requests over HTTP and another that accepts requests over JMS. Both APIs would route requests to the same native API on the back end.

Note: To make it easier to manage APIs, consider adopting a naming convention like the one shown above. Doing so will make it easier to identify APIs and the native API with which they are associated. Keep in mind however, that unlike native APIs, the names of APIs cannot contain spaces or special characters (except `_` and `-`). Consequently, if you adopt a convention that involves using the name of the native API as part of the API name, then the names of the native APIs themselves must not contain characters that are invalid in API names.

To use this action the following prerequisites must be met:

- Create an alias to a JNDI Provider (in the Integration Server Administrator, go to **Settings > Web Services**).
- To establish an active connection between Integration Server and the JMS provider, you must configure Integration Server to use a JMS connection alias (in the Integration Server Administrator, go to **Settings > Messaging > JMS Settings**).
- Create a WS (Web Service) endpoint alias for provider Web Service Descriptor (WSD) that uses a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.
- Configure a WS (Web Service) endpoint trigger (in the Integration Server Administrator, go to **Settings > Messaging > JMS Trigger Management**).

- Create a WS (Web Service) endpoint alias for consumer Web Service Descriptor (WSD) that has a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.
- Additionally, in the proxy API's **Message Flow** area, make sure that you delete the predefined *Straight Through Routing* and *HTTP Basic Authentication* actions from the **Receive** stage. This is because, these actions are mutually exclusive.

For detailed information and procedures, see the *webMethods Integration Server Administrator's Guide*.

Input Parameters

Connection URL	<p><i>String. Mandatory.</i> Specify a connection alias for connecting to the JMS provider (e.g., an Integration Server alias or a JNDI URL). For example, a JNDI URL of the form: <code>jms:queue:dynamicQueues/MyRequestQueue? wm-wsendpointalias=MediatorConsumer &targetService=vs-jms-in-echo</code></p> <p>Note that the <code>wm-wsendpointalias</code> parameter is required for Integration Server/Mediator to look up the JMS consumer alias to send the request to the specified queue (e.g., <code>MyRequestQueue</code>), which is a dynamic queue in ActiveMQ. Also, the <code>targetService</code> parameter is required if sending to another API that uses JMS as the entry protocol.</p>
Reply to Destination	<p><i>Optional.</i> Specify a queue name where a reply to a message should be sent.</p>
Priority	<p>Enter an integer that represents the priority of this JMS message with respect to other messages that are in the same queue. The priority value determines the order in which the messages are routed. The lower the Priority value, the higher the priority (i.e., 0 is the highest priority, and messages with this priority value are executed first).</p> <ul style="list-style-type: none"> ■ Priority values 0 through 10. ■ The default priority for a JMS message is 0.
Time to Live	<p><i>Optional.</i> A numeric value (in milliseconds) that specifies the expiration time of the JMS message. If the time-to-live is specified as zero, expiration is set to zero which indicates the message does not expire.</p> <p>The default value is 0.</p>

Delivery Mode *Optional.* The type of message delivery to the endpoint.

Value	Description
Persistent	The message is stored by the JMS server before delivering it to the client.
Non-Persistent	<i>Default.</i> The message is not stored before delivery.

What Happens if a Queue Includes Multiple JMS Messages?

To determine the order in which to execute the JMS messages in a queue, Mediator examines each message's Priority setting.

The Priority setting contains a non-negative integer that indicates the JMS message's priority. A priority value of 0 represents the highest possible priority.

Note: A JMS message's **Priority** property is used *only* when there are multiple JMS messages to route in the queue. If the queue has only one message to route, the **Priority** property is ignored entirely.

When a queue includes multiple JMS messages, Mediator routes the messages serially, in priority order from lowest to highest (that is, it routes with message the *lowest* priority value first). Each messages in the queue is routed to completion before the next one begins.

If two or more messages have the same priority value, their order is indeterminate. Mediator will route these messages in serial fashion after all lower priority messages and before any higher priority messages. However, you cannot predict their order

Example

If Mediator were given the following JMS messages to route for an API:

JMS Message	Priority
JMS Message A	11
JMS Message B	25
JMS Message C	11
JMS Message D	0

It would route the messages in the following order:

JMS Message	Priority
JMS Message D	0
JMS Message A then JMS Message C (or vice versa) The order of these two messages cannot be controlled or predicted because they have the same priority.	11
JMS Message B	25

Load Balancing and Failover Routing

If you have a native API that is hosted at two or more endpoints, you can use the Load Balancing and Failover Routing to distribute requests among the endpoints.

Requests are distributed across multiple endpoints. The requests are intelligently routed based on the "round-robin" execution strategy. The load for a service is balanced by directing requests to two or more services in a pool, until the optimum level is achieved. The application routes requests to services in the pool sequentially, starting from the first to the last service without considering the individual performance of the services. After the requests have been forwarded to all the services in the pool, the first service is chosen for the next loop of forwarding.

Load-balanced endpoints also have automatic Failover capability. If a load-balanced endpoint is unavailable (for example, if a connection is refused), then that endpoint is marked as "down" for the number of seconds you specify in the `Timeout` field (during which the endpoint will not be used for sending the request), and the next configured endpoint is tried. If all the configured load-balanced endpoints are down, then a failure is sent back to the client. After the timeout expires, each endpoint marked will be available again to send the request.

Input Parameters

Route To *URI. Mandatory.* Enter the URLs of two or more endpoints in a pool to which the requests will be routed. The application routes the requests to endpoints in the pool sequentially, starting from the first to the last endpoint without considering the individual performance of the endpoints. After the requests have been forwarded to all the endpoints in the pool, the first endpoint is chosen for the next loop of forwarding.

Enter the URL of the endpoint to route the request to. For example:

```
http://mycontainer/creditCheckService
```

To specify additional endpoints, use the plus button next to the field to add rows.

Click the **Configure Endpoint Properties**  icon (next to the field) if you want to configure a set of properties for the endpoints individually.

Alternatively, Mediator offers "Local Optimization" capability if the native API is hosted on the same Integration Server as Mediator. With local optimization, API invocation happens in-memory and not through a network hop.

```
local://<Service-full-path>
```

OR

```
local://<server>:<port>/ws/<Service-full-path>
```

For example:

```
local://MyAPIFolder:MyLocalAPI
```

which points to the endpoint API `MyLocalAPI` which is present under the folder `MyAPIFolder` in Integration Server.

Note: Local Optimization is not applicable to REST based APIs.

Configure
Endpoint
Properties
icon

Optional. This icon displays the **Endpoint Properties** dialog box that enables you to configure a set of properties for the Mediator to route incoming requests to the native API as follows:

SOAP

Optimization

Method

Only for SOAP-based APIs. Mediator can use the following optimization methods to parse SOAP requests to the native API:

<u>Value</u>	<u>Description</u>
MTOM	Mediator will use the Message Transmission Optimization Mechanism (MTOM) to parse SOAP requests to the API.
SwA	Mediator will use the SOAP with Attachment (SwA) technique to parse SOAP requests to the API.
None	<i>Default.</i> Mediator will not use any optimization method to parse the SOAP requests to the API.

Note: Keep the following in mind:

- Bridging between SwA and MTOM is not supported. If a client sends a SwA request, Mediator can only forward SwA to the native API. The same is true for MTOM, and applies to responses received from the native API. That is, a SwA or MTOM response received by Mediator from a native API will be forwarded to the client using the same format it received.
- When sending SOAP requests that do not contain a MTOM or SWA attachment to a native API that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related'. This is necessary so Mediator knows how to parse the response properly.

HTTP
Connection
Timeout

Number.Optional. The time interval (in seconds) after which a connection attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the `Connection Timeout` field (in the Integration Server Administrator, go to **Settings > Extended**). *Default:* 30 seconds.

Read
Timeout

Number.Optional. The time interval (in seconds) after which a socket read attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the `Read Timeout` field (in the Integration Server Administrator, go to **> Settings > Extended**). *Default:* 30 seconds.

SSL
Configuration

Optional. To enable SSL client authentication that Mediator will use to authenticate incoming requests for the native API, you must specify values for both the Client Certificate Alias field and the IS Keystore Alias field. If you specify a value for only one of these fields, a deployment error will occur.

Note: SSL client authentication is optional; you may leave both fields blank.

Prerequisite: You must set up the key alias and keystore properties in the Integration Server. For

the procedure, see *webMethods Integration Server Administrator's Guide*.

You will use these properties to specify the following fields:

<u>Value</u>	<u>Description</u>
Client Certificate Alias	<i>Mandatory.</i> The client's private key to be used for performing SSL client authentication.
IS Keystore Alias	<i>Mandatory.</i> The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) will be used for performing SSL client authentication.
WS Security Header	<i>Only for SOAP-based APIs.</i> Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native API.
<u>Value</u>	<u>Description</u>
Remove processed security headers	<i>Default.</i> Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the API's security run-time policy). Note that Mediator will not remove the security header if both of the following conditions are true: 1) Mediator did not process the security header, and 2) the mustUnderstand attribute of the security header is 0/false).
Pass all security headers	Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the API's security action).

Log Invocation

This action logs request/response payloads. You can specify the log destination and the logging frequency. This action also logs other information about the requests/responses, such as the API name, operation name, the Integration Server user, a timestamp, and the response time.

Input Parameters

Payloads *String.* Specify whether to log all request/response payloads.

Value	Description
Request	Logs all request payloads.
Response	Logs all response payloads.

Log Generation Frequency *String.* Specify how frequently to log the payload.

Value	Description
Always	Logs all requests and/or responses.
On Success	Logs only the successful responses and/or requests.
On Failure	Logs only the failed requests and/or responses.

Send Data To *String.* Specify where to log the payload.

Important Ensure that Mediator is configured to log the payloads to the destination(s) you specify here. For details, see *Administering webMethods Mediator*.

Value	Description
CentraSite	Logs the payloads in the API's Events profile in CentraSite. Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator >

Administration > CentraSite Communication). For the procedure, see *Administering webMethods Mediator*.

Local Log	<p>Logs the payloads in the server log of the Integration Server on which Mediator is running.</p> <p>Also choose a value in the <code>Log Level</code> field:</p> <ul style="list-style-type: none"> ■ Info: logs the error-level, warning-level, and informational-level alerts. ■ Warn: logs the error-level and warning-level alerts. ■ Error: logs only error-level alerts. <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Important: The Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to Settings > Logging > Server Logger).</p> </div>
SNMP	<p>Logs the payloads in CentraSite's SNMP server or a third-party SNMP server.</p> <p>Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > SNMP). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Email	<p>Sends the payloads to an SMTP email server, which sends them to the email address(es) you specify here. Mediator sends the payloads as email attachments that are compressed using gzip data compression. To specify multiple addresses, use the  button to add rows.</p> <p>Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Audit Log	<p>Logs the payload to the Integration Server audit logger. For more information about logging, see the <i>webMethods Audit Logging Guide</i>.</p> <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Note: If you expect a high volume of events in your system, it is recommended that you select the Audit Log destination for this action.</p> </div>

EDA

Mediator can use EDA to log the payloads to a database.

Prerequisite: You must configure the EDA destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > EDA**). For the procedure, see *Administering webMethods Mediator*.

Monitor Service Level Agreement

This action monitors a set of run-time performance conditions for an API, and sends alerts to a specified destination when the performance conditions are violated. This action enables you to monitor run-time performance for *one or more specified clients*.

You can configure this action to define a *Service Level Agreement (SLA)*, which is a set of conditions that defines the level of performance that a client should expect from an API. You can use this action to identify whether an API threshold rules are met or exceeded. For example, you might define an agreement with a particular client that sends an alert to the client (consumer application) if responses are not sent within a certain maximum response time. You can configure SLAs for each API/consumer application combination.

For the counter-based metrics (Total Request Count, Success Count, Fault Count), Mediator sends an alert as soon as the performance condition is violated, without having to wait until the end of the metrics tracking interval. You can choose whether to send an alert only once during the interval, or every time the violation occurs during the interval. (Mediator will send another alert the next time a condition is violated during a subsequent interval.) For information about the metrics tracking interval, see "[The Metrics Tracking Interval](#)" on page 318.

For the aggregated metrics (Average Response Time, Minimum Response Time, Maximum Response Time), Mediator aggregates the response times at the end of the interval, and then sends an alert if the performance condition is violated.

This action does not include metrics for failed invocations.

Note: To enable Mediator to publish performance metrics, you must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.

Input Parameters

Action
Configuration
Parameters

Specify one or more conditions to monitor. To do this, specify a metric, operator, and value for each metric. To specify multiple conditions, use the  button to add multiple rows. If multiple parameters are used, they are connected by the AND operator.

NameOperator	<i>String. Array.</i> The metrics to monitor.																
	<table border="1"> <thead> <tr> <th>Value</th> <th>Description</th> </tr> </thead> <tbody> <tr> <td>Availability</td> <td>Indicates whether the API was available to the specified clients in the current interval.</td> </tr> <tr> <td>Average Response Time</td> <td>The average amount of time it took the service to complete all invocations in the current interval. Response time is measured from the moment Mediator receives the request until the moment it returns the response to the caller.</td> </tr> <tr> <td>Fault Count</td> <td>Indicates the number of faults returned in the current interval.</td> </tr> <tr> <td>Maximum Response Time</td> <td>The maximum amount of time to respond to a request in the current interval.</td> </tr> <tr> <td>Minimum Response Time</td> <td>The minimum amount of time to respond to a request in the current interval.</td> </tr> <tr> <td>Successful Request Count</td> <td>The number of successful requests in the current interval.</td> </tr> <tr> <td>Total Request Count</td> <td>The total number of requests (successful and unsuccessful) in the current interval.</td> </tr> </tbody> </table>	Value	Description	Availability	Indicates whether the API was available to the specified clients in the current interval.	Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. Response time is measured from the moment Mediator receives the request until the moment it returns the response to the caller.	Fault Count	Indicates the number of faults returned in the current interval.	Maximum Response Time	The maximum amount of time to respond to a request in the current interval.	Minimum Response Time	The minimum amount of time to respond to a request in the current interval.	Successful Request Count	The number of successful requests in the current interval.	Total Request Count	The total number of requests (successful and unsuccessful) in the current interval.
Value	Description																
Availability	Indicates whether the API was available to the specified clients in the current interval.																
Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. Response time is measured from the moment Mediator receives the request until the moment it returns the response to the caller.																
Fault Count	Indicates the number of faults returned in the current interval.																
Maximum Response Time	The maximum amount of time to respond to a request in the current interval.																
Minimum Response Time	The minimum amount of time to respond to a request in the current interval.																
Successful Request Count	The number of successful requests in the current interval.																
Total Request Count	The total number of requests (successful and unsuccessful) in the current interval.																
	<i>String. Array.</i> Specifies an operator.																
Value	<i>Integer. Array.</i> Specifies an alert value.																
Alert for Consumer Applications	<i>Object. Array.</i> Specify the Application asset(s) to which this Service Level Agreement will apply. To specify multiple consumer applications, use the  button to add multiple rows.																

Alert Configuration Parameters	Specifies the parameters for the alerts that will report on the Service Level Agreement conditions:
Alert Interval	<i>Number</i> . The time period (in minutes) in which to monitor performance before sending an alert if a condition is violated. For information about the metrics tracking interval, see " The Metrics Tracking Interval " on page 318.
Alert Frequency	<i>String</i> . Specifies how frequently to issue alerts for the counter-based metrics (Total Request Count, Success Count, Fault Count).

<u>Value</u>	<u>Description</u>
Every Time	Issue an alert every time one of the specified conditions is violated.
Only Once	Issue an alert only the first time one of the specified conditions is violated.

Alert Destination	<i>String</i> . Specifies where to log the alert.
-------------------	---

Important: Ensure that Mediator is configured to send event notifications to the destination(s) you specify here. For details about alerts and transaction logging, see *Administering webMethods Mediator*.

<u>Value</u>	<u>Description</u>
CentraSite	Sends the alerts to the API's Events profile in CentraSite. Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For information about how to configure communication with CentraSite, see <i>Administering webMethods Mediator</i> .
Local Log	Sends the alerts to the server log of the Integration Server on which Mediator is running. Also choose a value in the <code>Log Level</code> field:

- Info: Logs error-level, warning-level, and informational-level alerts.
- Warn: Logs error-level and warning-level alerts.
- Error: Logs only error-level alerts.

Important: The Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to **Settings > Logging > Server Logger**).

SNMP Sends the alerts to CentraSite's SNMP server or a third-party SNMP server.

Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > Email**). For the procedure, see *Administering webMethods Mediator*.

Email Sends the alerts to an SMTP email server, which sends them to the email address(es) you specify here. To specify multiple addresses, use the  button to add rows.

Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > Email**). For the procedure, see *Administering webMethods Mediator*.

EDA Mediator can use EDA to log the payloads to a database.

Prerequisite: You must configure the EDA destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > EDA**). For the procedure, see *Administering webMethods Mediator*.

Alert Message *String. Optional.* Specify a text message to include in the alert.

Monitor Service Performance

This action is similar to the "[Monitor Service Level Agreement](#)" on page 424 action. Both actions can monitor the same set of run-time performance conditions for an API,

and then send alerts when the performance conditions are violated. However, this action monitors run-time performance for *a specific client*.

For the counter-based metrics (Total Request Count, Success Count, Fault Count), Mediator sends an alert as soon as the performance condition is violated, without having to wait until the end of the metrics tracking interval. You can choose whether to send an alert only once during the interval, or every time the violation occurs during the interval. (Mediator will send another alert the next time a condition is violated during a subsequent interval.) For information about the metrics tracking interval, see "[The Metrics Tracking Interval](#)" on page 318.

For the aggregated metrics (Average Response Time, Minimum Response Time, Maximum Response Time), Mediator aggregates the response times at the end of the interval, and then sends an alert if the performance condition is violated.

This action does not include metrics for failed invocations.

Note: To enable Mediator to publish performance metrics, you must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For detailed information about configuring communication with CentraSite, see *Administering webMethods Mediator*.

Input Parameters

Action Configuration Parameters Specify one or more conditions to monitor. To do this, specify a metric, operator, and value for each metric. To specify multiple conditions, use the  button to add multiple rows. If multiple parameters are used, they are connected by the AND operator.

NameOperator *String. Array.* The metrics to monitor.

Value	Description
Availability	Indicates whether the service was available to the specified clients in the current interval.
Average Response Time	The average amount of time it took the service to complete all invocations in the current interval. Response time is measured from the moment Mediator receives the request until the moment it returns the response to the caller.
Fault Count	Indicates the number of faults returned in the current interval.

	Maximum Response Time	The maximum amount of time to respond to a request in the current interval.
	Minimum Response Time	The minimum amount of time to respond to a request in the current interval.
	Successful Request Count	The number of successful requests in the current interval.
	Total Request Count	The total number of requests (successful and unsuccessful) in the current interval.
		<i>String. Array.</i> Specify an operator.
Value		<i>Integer. Array.</i> Specify an alert value.
Alert Configuration Parameters		Specify the parameters for the alerts that will report on the Service Level Agreement conditions:
Alert Interval		<i>Number.</i> The time period (in minutes) in which to monitor performance before sending an alert if a condition is violated. For information about the metrics tracking interval, see " The Metrics Tracking Interval " on page 318.
Alert Frequency		<i>String.</i> Specify how frequently to issue alerts for the counter-based metrics (Total Request Count, Success Count, Fault Count).
	Value	Description
	Every Time	Issue an alert every time one of the specified conditions is violated.
	Only Once	Issue an alert only the first time one of the specified conditions is violated.
Alert Destination		<i>String.</i> Specify where to log the alert.
	Important	Ensure that Mediator is configured to send event notifications to the destination(s) you specify here.

For details about alerts and transaction logging, see *Administering webMethods Mediator*.

Value	Description
CentraSite	<p>Sends the alerts to the API's Events profile in CentraSite.</p> <p>Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For information about how to configure communication with CentraSite, see <i>Administering webMethods Mediator</i>.</p>
Local Log	<p>Sends the alerts to the server log of the Integration Server on which Mediator is running.</p> <p>Also choose a value in the Log Level field:</p> <ul style="list-style-type: none"> ■ Info: Logs error-level, warning-level, and informational-level alerts. ■ Warn: Logs error-level and warning-level alerts. ■ Error: Logs only error-level alerts. <div style="border: 1px solid gray; padding: 5px; margin-top: 10px;"> <p>Important: The Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to Settings > Logging > Server Logger).</p> </div>
SNMP	<p>Sends the alerts to CentraSite's SNMP server or a third-party SNMP server.</p> <p>Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Email	<p>Sends the alerts to an SMTP email server, which sends them to the email address(es) you specify here. To specify multiple addresses, use the  button to add rows.</p>

Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > Email**). For the procedure, see *Administering webMethods Mediator*.

EDA

Mediator can use EDA to log the payloads to a database.

Prerequisite: You must configure the EDA destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > EDA**). For the procedure, see *Administering webMethods Mediator*.

Alert
Message

String. Optional. Specify a text message to include in the alert.

NTLM Authentication

This action uses the NTLM authentication to validate incoming requests from clients. Mediator authorizes the NTLM credentials (username and password) against a list of all global consumers available in the Mediator.

If the username/password value in the Authorization header cannot be authenticated as a valid Integration Server user (or if the Authorization header is not present in the request), a 500 SOAP fault is returned, and the client is presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated. If the client does not successfully respond to the challenge, a 401 Unauthorized "WWW-Authenticate: NTLM" (for NTLM authentication) or "WWW-Authenticate: Negotiate" (for Kerberos authentication) is returned in the response header and the invocation is not routed to the policy engine. As a result, no events are recorded for that invocation, and its key performance indicator (KPI) data are not included in the performance metrics.

Note: Note that if Mediator is used to access a native API protected by NTLM (which is typically hosted in IIS), then the native API in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as "Windows", then "NTLM" should be in its list.

If none of the authentication actions ("[HTTP Basic Authentication](#)" on page 413, "[NTLM Authentication](#)" on page 431 or "[OAuth2 Authentication](#)" on page 433) is configured for a proxy API, Mediator forwards the request to the native API, without attempting to authenticate the request.

Input Parameters

Authenticate Using *String*. Specifies the user credentials for authenticating client requests to the native API.

Note: If Mediator is used to access a native API protected by NTLM (which is typically hosted in IIS), then the native API in IIS should be configured to use NTLM as the authentication scheme. If the authentication scheme is configured as "Windows", then "NTLM" should be in its list. The "Negotiate" handshake will be supported in the near future. This note applies to all three of the following options for NTLM.

<u>Value</u>	<u>Description</u>								
Existing Credentials	<i>Default.</i> Mediator uses the user credentials passed in the request header for an NTLM handshake with the server.								
Custom Credentials	Mediator uses the values you specify in the User , Password and Domain fields for an NTLM handshake with the server.								
	<table border="1"> <thead> <tr> <th><u>Field</u></th> <th><u>Description</u></th> </tr> </thead> <tbody> <tr> <td>Username</td> <td><i>String. Mandatory.</i> Account name of a consumer who is available in the Integration Server on which Mediator is running.</td> </tr> <tr> <td>Password</td> <td><i>String. Mandatory.</i> A valid password of the consumer.</td> </tr> <tr> <td>Domain</td> <td><i>String. Optional.</i> Domain used by the server to authenticate the consumer.</td> </tr> </tbody> </table>	<u>Field</u>	<u>Description</u>	Username	<i>String. Mandatory.</i> Account name of a consumer who is available in the Integration Server on which Mediator is running.	Password	<i>String. Mandatory.</i> A valid password of the consumer.	Domain	<i>String. Optional.</i> Domain used by the server to authenticate the consumer.
<u>Field</u>	<u>Description</u>								
Username	<i>String. Mandatory.</i> Account name of a consumer who is available in the Integration Server on which Mediator is running.								
Password	<i>String. Mandatory.</i> A valid password of the consumer.								
Domain	<i>String. Optional.</i> Domain used by the server to authenticate the consumer.								
Transparent	<p>Mediator supports Kerberos handshake in Transparent mode. The following additional settings are required for Kerberos:</p> <ul style="list-style-type: none"> ■ Configure the client with <code>clientCredentialType</code> set to <code>Windows</code>. ■ Set the value of <code>watt.pg.disableNtlmAuthHandler</code> property 								

to `true` in the extended settings for the Integration Server

- Set the property `handleClientErrorCode` to `true` in `pg-core.xml` as follows:

```
<bean
  id="httpResponseCodeCallback"
  class="com.softwareag.pg.axis2.transports.ISHTTPResponseCodeCallback">
<property name="handleClientErrorCode"
  value="true"/>
</bean>
```

For more information about configuring the extended settings, see *webMethods Integration Server Administrator's Guide*.

OAuth2 Authentication

This action uses the OAuth 2.0 authentication to validate incoming requests from clients. Mediator authorizes the OAuth 2.0 credentials (access token) against a list of all global consumers available in the Mediator.

If the access token value in the Authorization header cannot be authenticated as a valid Integration Server user (or if the Authorization header is not present in the request), a 500 SOAP fault is returned, and the client is presented with a security challenge. If the client successfully responds to the challenge, the user is authenticated. If the client does not successfully respond to the challenge, a "WWW-Authenticate: OAuth" response is returned and the invocation is not routed to the policy engine. As a result, no events are recorded for that invocation, and its key performance indicator (KPI) data are not included in the performance metrics.

If none of the authentication actions ("[HTTP Basic Authentication](#)" on page 413, "[NTLM Authentication](#)" on page 431 or "[OAuth2 Authentication](#)" on page 433) is configured for a proxy API, Mediator forwards the request to the native API, without attempting to authenticate the request.

Input Parameters

Authenticate Using	<i>String</i> . Specifies the OAuth2 access token for authenticating client requests to the native API.
--------------------	---

Value	Description
Existing Token	<i>Default</i> . Mediator uses the OAuth2 access token specified in the HTTP "Authorization" header to validate client requests for a native API.

Custom Token Mediator uses the access token you specify in the **OAuth2 Token**, field to validate client requests for a native API.

Field	Description
OAuth2 Token	<i>String. Mandatory.</i> Specifies an OAuth2 access token to be deployed by Mediator. The consumer need not pass the OAuth2 token during service invocation.

Response Transformation

The *Response Transformation* action specifies:

- The XSLT transformation file to transform response messages from native APIs into a format required by the client.

In some cases a message needs to be transformed prior to sending to the client.

For example, you might need to accommodate differences between the message content that a native API is capable of submitting and the message content that a client expects. For example, if the native API submits an order record using a slightly different structure than the structure expected by the client, you can use this action to transform the record submitted by the native API to the structure required by the client.

When this action is configured for a proxy API, the native API's response messages are transformed into the format required by the client, before Mediator returns the responses to the clients.

Input Parameters

Transformation File *File. Mandatory.* Click **Choose**, select the XSL transformation file from your file system and click **OK**.

When you virtualize an API, the transformation file is validated. If there are no validation errors, the XSLT file is displayed as a download link in the same dialog. If the transformation file is invalid (for example, non-XSLT file), this will be indicated by a warning icon.

Note: If you make changes to the XSLT file in the future, you must republish the API.

Important: The XSL file uploaded by the user should not contain the XML declaration in it (e.g., `xml version="1.0" encoding="UTF-8"`). This is because when the API is published to Mediator, Mediator embeds the XSL file in the virtual service definition (VSD), and since the VSD itself is in XML format, there cannot be an XML declaration line in the middle of it. This can lead to unexpected deployment issues which can be avoided by making sure the XSL file does not contain the declaration line.

Request Transformation

The *Request Transformation* action specifies:

- The XSLT Transformation File to transform request messages from clients into a format required by the native API.

In some cases a native API might need to transform messages.

For example, you might need to accommodate differences between the message content that a client is capable of submitting and the message content that a native API expects. For example, if the client submits an order record using a slightly different structure than the structure expected by the native API, you can use this action to transform the record submitted by the client to the structure required by the native API.

When this action is configured for a proxy API, the incoming requests from the clients are transformed into a format required by the native API, before Mediator sends the requests to the native APIs.

Input Parameters

Transformation File *File. Mandatory.* Click **Choose**, select the XSL transformation file from your file system and click **OK**.

When you virtualize an API, the transformation file is validated. If there are no validation errors, the XSLT file is displayed as a download link in the same dialog. If the transformation file is invalid (for example, non-XSLT file), this will be indicated by a warning icon.

Note: If you make changes to the XSLT file in the future, you must republish the API.

Important: The XSL file uploaded by the user should not contain the XML declaration in it (e.g., `xml version="1.0" encoding="UTF-8"`). This is because when the API is published to Mediator, Mediator embeds the XSL file in the virtual service definition (VSD), and since the

VSD itself is in XML format, there cannot be an XML declaration line in the middle of it. This can lead to unexpected deployment issues which can be avoided by making sure the XSL file does not contain the declaration line.

Require Encryption

This action requires that a request's XML element (which is represented by an XPath expression) be encrypted.

To use this action, the following prerequisites must be met:

1. **Configure Integration Server:** Set up keystores and truststores in Integration Server, as described in the *webMethods Integration Server Administrator's Guide*.
2. **Configure Mediator:** In the Integration Server Administrator, navigate to **Solutions > Mediator > Administration > General** and complete the IS Keystore Name, IS Truststore Name and Alias (signing) fields, as described in *Administering webMethods Mediator*.

When this action is configured for a proxy API, Mediator provides decryption of incoming requests and encryption of outgoing responses. Mediator can encrypt and decrypt only individual elements in the SOAP message body that are defined by the XPath expressions configured for the action. Mediator requires that requests contain the encrypted elements that match those in the XPath expression. You must encrypt the entire element, not just the data between the element tags. Mediator rejects requests if the element name is not encrypted.

Important: Do not encrypt the entire SOAP body because a SOAP request without an element will appear to Mediator to be malformed.

Mediator attempts to encrypt the response elements that match the XPath expressions with those defined for the action. If the response does not have any elements that match the XPath expression, Mediator will not encrypt the response before sending. If the XPath expression resolves a portion of the response message, but Mediator cannot locate a certificate to encrypt the response, then Mediator sends a SOAP fault exception to the client and a Policy Violation event notification to CentraSite.

How Mediator Encrypts Responses

The Require Encryption action encrypts the response back to the client by dynamically setting a public key alias at run time. Mediator determines the public key alias as follows:

- If Mediator can access the X.509 certificate of the client (based on the incoming request signature), it will use "useReqSigCert" as the public key alias.
- OR
- If an "Evaluate" action is present in the message flow (and it successfully identifies a client), then Mediator will look for a public key alias with that client name in the "IS Keystore Name" property. The "IS Keystore Name" property is specified in the

Integration Server Administrator, under **Solutions > Mediator > Administration > General**. This property should be set to an Integration Server keystore that Mediator will use.

For an “Evaluate” action that allows for anonymous usage, Mediator does *not* require a client name in order to send encrypted responses. In this case, Mediator can use one of the following to encrypt the response in the following order, depending on what is present in the security element:

- A signing certificate.
- Client name.
- WSS username, SAML token or X.509 certificate.
- HTTP authorized user.

OR

- If Mediator can determine the current IS user from the request (i.e., if an Integration Server WS-Stack determined that Subject is present), then the first principal in that subject is used.

OR

- If the above steps all fail, then Mediator will use either the WS-Security username token or the HTTP Basic-Auth username value. There should be a public key entry with the same name as the identified username.

Input Parameters

Namespace

String. Mandatory. Namespace of the element required to be encrypted.

Note: Enter the namespace prefix in the following format:
xmlns:<prefix-name>. For example: xmlns:soapenv.

The generated XPath element in the policy should look similar to this:

```
<sp:SignedElements xmlns:sp=
"http://docs.oasis-open.org/
ws-sx/ws-securitypolicy/200702">
<sp:XPath xmlns:soapenv=
"http://schemas.xmlsoap.org/soap/envelope
/">//soapenv:Body</sp:XPath>
</sp:SignedElements>
```

Element to be Encrypted

String. Mandatory. An XPath expression that represents the XML element that is required to be encrypted. See the sample below.

Let's take a look at an example. For the following SOAP message:

```
<?xml version="1.0" encoding="UTF-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Header>
```

```

</soap:Header>
<soap:Body>
  <catalog xmlns="http://www.store.com">
    <name>My Book</name>
    <author>ABC</author>
    <price>100</price>
  </catalog>
</soap:Body>
</soap:Envelope>

```

The XPath expression appears as follows:

```
/soap:Envelope/soap:Body
```

Require HTTP / HTTPS

If you have a native API that requires clients to communicate with the server using the HTTP and/or HTTPS protocols, you can use the Require HTTP / HTTPS protocol action.

This action allows you to bridge the transport protocols between the client and the Mediator. For example, suppose you have a native API that is exposed over HTTPS and an API that receives requests over HTTP. In this situation, you can configure the API's Require HTTP / HTTPS action to accept HTTP requests and configure its Routing action to route the request to the native API using HTTPS.

Input Parameters

Protocol *String*. Specifies the protocol over which the Mediator accepts requests from the client.

Note: CentraSite supports HTTP version 1.1 only.

Important: Before you deploy an API over HTTPS, ensure that the Integration Server on which the Mediator is running has been configured for SSL. In addition, make sure you specify an HTTPS port in the Mediator's `Ports Configuration` page. (In the Integration Server Administrator, go to **Solutions > Mediator > Administration > General** and specify the port in the **HTTPS Ports Configuration** field.) For details on the Port Configuration page, see *Administering webMethods Mediator*.)

<u>Value</u>	<u>Description</u>
HTTP	<i>Default.</i> Mediator will only accept requests that are sent using the HTTP protocol.
HTTPS	Mediator will only accept requests that are sent using the HTTPS protocol.

You can select *both* HTTP and HTTPS if needed.

SOAP
Version *String. For SOAP-based APIs.* Specifies the SOAP version of the requests which the Mediator accepts from the client.

<u>Value</u>	<u>Description</u>
SOAP 1.1	<i>Default.</i> Mediator will only accept requests that are in the SOAP 1.1 format.
SOAP 1.2	Mediator will only accept requests that are in the SOAP 1.2 format.

Require JMS

If you have a native API that requires clients to communicate with the server using the JMS protocol, you can use the Require JMS protocol action.

This action allows you to bridge protocols between the client and the native API. For example, suppose you have a native API that is exposed over JMS and a client that submits SOAP requests over HTTP. In this situation, you can configure the API's Require JMS Protocol action to accept SOAP requests over Java Message Service (JMS) and configure its JMS Routing Rule action to route the request to the Web service using JMS.

When this action is configured for a proxy API, you can intentionally expose an API over a JMS protocol. For example, if you have a native API that is exposed over HTTP, you might expose the API over JMS simply to gain the asynchronous-messaging and guaranteed-delivery benefits that one gains by using JMS as the message transport.

To use this action the following prerequisites must be met:

- Create an alias to a JNDI Provider (in the Integration Server Administrator, go to **Settings > Web Services**).
- To establish an active connection between Integration Server and the JMS provider, you must configure Integration Server to use a JMS connection alias (in the Integration Server Administrator, go to **Settings > Messaging > JMS Settings**).
- Create a WS (Web Service) endpoint alias for provider Web Service Descriptor (WSD) that uses a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.
- Configure a WS (Web Service) endpoint trigger (in the Integration Server Administrator, go to **Settings > Messaging > JMS Trigger Management**).
- Create a WS (Web Service) endpoint alias for consumer Web Service Descriptor (WSD) that has a JMS binder. In the Integration Server Administrator, navigate to

Settings > Web Services and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.

- Additionally, in the API's Message Flow, make sure that you delete the predefined *Require HTTP / HTTPS Protocol* action from the Receive stage. This is because, these actions are mutually exclusive.

For detailed procedures, see *webMethods Integration Server Administrator's Guide*.

Input Parameters

JMS Provider Alias *String. Mandatory.* Specify the name of Integration Servers JMS provider alias. The alias should include the JNDI destination name and the JMS connection factory.

SOAP Version *String.* Specify the SOAP version of the requests which the Mediator accepts from the client.

Value	Description
SOAP 1.1	<i>Default.</i> Mediator will only accept requests that are in the SOAP 1.1 format.
SOAP 1.2	Mediator will only accept requests that are in the SOAP 1.2 format.

Require Signing

This action requires that a request's XML element (which is represented by an XPath expression) be signed.

Prerequisites

1. Configure Integration Server: Set up keystores and truststores in Integration Server, as described in the *webMethods Integration Server Administrator's Guide*.
2. Configure Mediator: In the Integration Server Administrator, navigate to **Solutions > Mediator > Administration > General** and complete the IS Keystore Name, IS Truststore Name and Alias (signing) fields, as described in *Administering webMethods Mediator*. Mediator uses the signing alias specified in the Alias (signing) field to sign the response.

When this action is configured for a proxy API, Mediator validates that the requests are properly signed, and provides signing for responses. Mediator provides support both for signing an entire SOAP message body or individual elements of the SOAP message body. Mediator uses a digital signature element in the security header to verify that all elements matching the XPath expression were signed. If the request contains elements that were not signed or no signature is present, then Mediator rejects the request.

Note: You must map the public certificate of the key used to sign the request to an Integration Server user. If the certificate is not mapped, Mediator returns a SOAP fault to the caller.

Input Parameters

Namespace *String. Mandatory.* Namespace of the element required to be signed.

Note: Enter the namespace prefix in the following format: `xmlns:<prefix-name>`. For example: `xmlns:soapenv`.

The generated XPath element in the policy should look similar to this:

```
<sp:SignedElements xmlns:sp=
"http://docs.oasis-open.org/ws-sx/
ws-securitypolicy/200702">
<sp:XPath xmlns:soapenv=
"http://schemas.xmlsoap.org/soap/envelope
/">//soapenv:Body</sp:XPath>
</sp:SignedElements>
```

Element to be Signed *String. Mandatory.* An XPath expression that represents the XML element that is required to be signed. See the sample below.

Let's take a look at an example. For the following SOAP message:

```
<?xml version="1.0" encoding="UTF-8"?>
<soap:Envelope xmlns:soap="http://schemas.xmlsoap.org/soap/envelope/">
  <soap:Header>
</soap:Header>
  <soap:Body>
    <catalog xmlns="http://www.store.com">
      <name>My Book</name>
      <author>ABC</author>
      <price>100</price>
    </catalog>
  </soap:Body>
</soap:Envelope>
```

The XPath expression appears as follows:

```
/soap:Envelope/soap:Body
```

Require SSL

This action requires that requests be sent via SSL client certificates.

When this action is configured for a proxy API, Mediator ensures that requests are sent to the server using the HTTPS protocol (SSL). The action also specifies whether the client certificate is required. This allows Mediator to verify the client sending the request. If the action requires the client certificate, but it is not presented, Mediator rejects the message.

When a client certificate is required by the action, the Integration Server HTTPS port should be configured to request or require a client certificate.

Note: In Integration Server, create an HTTPS port, as described in the *webMethods Integration Server Administrator's Guide*.

Input Parameters

Client Certificate Required	Specifies whether client certificates are required for the purposes of: <ul style="list-style-type: none">■ Verifying the signature of signed SOAP requests or decrypting encrypted SOAP requests■ Signing SOAP responses or encrypting SOAP responses
-----------------------------	---

Require Timestamps

When this action is set for the API, Mediator requires that timestamps be included in the request header. Mediator checks the timestamp value against the current time to ensure that the request is not an old message. This serves to protect your system against attempts at message tampering, such as replay attacks.

Mediator rejects the request if either of the following happens:

- Mediator receives a timestamp that exceeds the time defined by the timestamp element.
- A timestamp element is not included in the request.

Note: This action has no input parameters; you simply drag and drop the action into the **Message Flow** area.

Input Parameters

None.

Require WSS SAML Token

When this action is configured for a proxy API, Mediator uses a WSS Security Assertion Markup Language (SAML) assertion token to validate clients for an API.

Note: For information about configuring your system for SAML token processing, see *Administering webMethods Mediator*.

Input Parameters

SAML Subject Confirmation

String Specifies the SAML subject confirmation methods:

Value	Description
Holder of Key	<p>Default. Select this option if clients use the SAML V1.1 or V2.0 Holder-of-Key Web Browser SSO Profile, which allows for transport of holder-of-key assertions. In this scenario, the client presents a holder-of-key SAML assertion acquired from its preferred identity provider to access a web-based resource at an API provider.</p> <p>If you select <code>Holder of Key</code>, Mediator also implicitly selects the “timestamp” and “signing” assertions to the virtual service definition (VSD). Thus, you should not add the “Require Timestamps” and “Require Signing” actions to the API if the “Require WSS SAML Token” action is already applied.</p>
Bearer	<p>Select this option if clients use the SAML V1.1 Bearer token authentication, in which a Bearer token mechanism relies upon bearer semantics as a means by which the client conveys to Mediator the sender's identity.</p> <p>If you select <code>Bearer</code>, the “timestamp” and “signing” assertions will be added to the virtual service definition (VSD).</p> <p>Note: If clients use SAML 2.0 Sender-Vouches tokens, configure your system as described in <i>Administering WebMethods Mediator</i>.</p>

SAML Version

String Specifies the WSS SAML Token version to use: 1.1 or 2.0.

Set Custom Headers

When this action is configured for a proxy API, Mediator includes custom HTTP headers to the client requests before submitting to the native APIs.

Input Parameters

Header *String*. Mediator uses the HTTP headers that you specify in the **Name** and **Value** columns below. If you need to specify multiple headers, use the  button to add rows.

<u>Value</u>	<u>Description</u>
Name	<i>String</i> . A name for the HTTP header field. The header field name (\$field) is not case sensitive.
Value	<i>String</i> . A value for the HTTP header field.

Sample

Let's imagine you have a Name field "Authorization". This will be encoded in Base64 scheme as follows: QXV0aG9yaXphdGlvbG==.

Set JMS Headers

Every JMS message includes message header properties that are always passed from provider to client. The purpose of the header properties is to convey extra information to the client outside the normal content of the message body.

When this action is configured for a proxy API, Mediator uses the JMS header properties to authenticate client requests before submitting to the native APIs.

To use this action the following prerequisites must be met:

- Create an alias to a JNDI Provider (in the Integration Server Administrator, go to **Settings > Web Services**).
- To establish an active connection between Integration Server and the JMS provider, you must configure Integration Server to use a JMS connection alias (in the Integration Server Administrator, go to **Settings > Messaging > JMS Settings**).
- Create a WS (Web Service) endpoint alias for provider Web Service Descriptor (WSD) that uses a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.
- Configure a WS (Web Service) endpoint trigger (in the Integration Server Administrator, go to **Settings > Messaging > JMS Trigger Management**).
- Create a WS (Web Service) endpoint alias for consumer Web Service Descriptor (WSD) that has a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.

For detailed instructions, see *webMethods Integration Server Administrator's Guide*.

Input Parameters

Header *String*. The JMS message headers that Mediator will use to authenticate incoming requests for the native API. To add additional rows, use the plus button.

Value	Description
Name	<i>String</i> . A name for the JMS message header field. The header field name (\$field) is not case sensitive.
Value	<i>String</i> . A value for the JMS message header field.

Settable JMS Header Properties

Property Name	Property Type	Getter Method
Message ID	string	getJMSMessageID()
Priority	int	getJMSPriority()
Time To Live	long	getTimeToLive()
Delivery Mode	int	getJMSDeliveryMode()
Message Expiration	long	getJMSExpiration()
Correlation ID	string	getJMSCorralationID()
Redelivered	boolean	getJMSRedelivered()
Time Stamp	long	getJMSTimeStamp()
Type	string	getJMSType()

Set Media Type

This action specifies the content type for a REST request or response. You would need to configure the **Set Media Type** action to:

- Specify the content type for a REST request received from a client. If the content type header is missing in a client request sent to an API, Mediator adds the content type specified here before sending the request to the native API.
- Specify the content type for a REST response (both for a REST API and SOAP API exposed as REST) before sending the response to the client. If a native API response (both for a REST API and SOAP API exposed as REST) does not contain a content type header, Mediator adds the content type specified here before sending the response to the client.

Note: This action is applicable only if the action **Enable REST Support** is set for a SOAP API.

Input Parameters

Media Type *String*. The content type header that CentraSite would use to send the REST request or response.

Examples for content types: application/json, application/xml

Set Message Properties

The message property fields are similar to header fields described previously in the *Set JMS Headers* action, except these fields are set exclusively by the consumer application. When a client receives a message, the properties are in read-only mode. If a client tries to modify any of the properties, a `MessageNotWriteableException` will be thrown.

The properties are standard Java name/value pairs. The property names must conform to the message selector syntax specifications defined in the `Message` interface.

Property fields are most often used for message selection and filtering. By using a property field, a message consumer can interrogate the property field and perform message filtering and selection.

When this action is configured for a proxy API, Mediator uses the message properties to authenticate client requests before submitting to the native APIs.

To use this action the following prerequisites must be met:

- Create an alias to a JNDI Provider (in the Integration Server Administrator, go to **Settings > Web Services**).
- To establish an active connection between Integration Server and the JMS provider, you must configure Integration Server to use a JMS connection alias (in the Integration Server Administrator, go to **Settings > Messaging > JMS Settings**).
- Create a WS (Web Service) endpoint alias for provider Web Service Descriptor (WSD) that uses a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.

- Configure a WS (Web Service) endpoint trigger (in the Integration Server Administrator, go to **Settings > Messaging > JMS Trigger Management**).
- Create a WS (Web Service) endpoint alias for consumer Web Service Descriptor (WSD) that has a JMS binder. In the Integration Server Administrator, navigate to **Settings > Web Services** and complete the Alias Name, Description, Descriptor Type, and Transport Type fields.

For detailed information, see *webMethods Integration Server Administrator's Guide*.

Input Parameters

Property *String*. The custom message properties Mediator will use to authenticate incoming requests for the native API. To add additional rows, use the plus button.

Value	Description
Name	<i>String</i> . The name of the property.
Value	<i>String</i> . The value of the property.

Straight Through Routing

This action routes the incoming requests to the Mediator directly to the native API.

1. Configure Integration Server: Set up keystores and truststores in Integration Server, as described in the *webMethods Integration Server Administrator's Guide*.
2. Configure Mediator: In the Integration Server Administrator, navigate to **Solutions > Mediator > Administration > General** and complete the IS Keystore Name, IS Truststore Name and Alias (signing) fields, as described in *Administering webMethods Mediator*.

When this action is configured for an API, Mediator ensures that requests from the client are parsed directly to the native API you specify. This action also includes a set of configuration properties for the Mediator to process the incoming requests for the native API.

Input Parameters

Route To *URI. Mandatory*. Enter the URL of the native API endpoint to route the request to in case all routing rules evaluate to False. For example:

`http://mycontainer/creditCheckService`

Click the **Configure Endpoint Properties**  icon (next to the **Route To** field) if you want to configure a set of properties for the specified endpoint.

Alternatively, Mediator offers "Local Optimization" capability if the native endpoint is hosted on the same Integration Server as Mediator. With local optimization, API invocation happens in-memory and not through a network hop.

Specify the native API in either of the following forms:

```
local://<Service-full-path>
```

OR

```
local://<server>:<port>/ws/<Service-full-path>
```

For example:

```
local://MyAPIFolder:MyLocalAPI
```

which points to the endpoint API `MyLocalAPI` which is present under the folder `MyAPIFolder` in Integration Server.

Note: Local Optimization is not applicable to REST based APIs.

Configure
Endpoint
Properties 
icon

Optional. This icon displays the **Endpoint Properties** dialog box that enables you to configure a set of properties for the Mediator to route incoming requests to the native API as follows:

SOAP Optimization Method	<i>For SOAP-based APIs.</i> Specifies the optimization methods that Mediator can use to parse SOAP requests to the native API.
--------------------------------	--

<u>Value</u>	<u>Description</u>
MTOM	Mediator will use the Message Transmission Optimization Mechanism (MTOM) to parse SOAP requests to the API.
SwA	Mediator will use the SOAP with Attachment (SwA) technique to parse SOAP requests to the API.
None	<i>Default.</i> Mediator will not use any optimization method to

parse the SOAP requests to the API.

Note:Keep the following in mind:

- Bridging between SwA and MTOM is not supported. If a client sends a SwA request, Mediator can only forward SwA to the native API. The same is true for MTOM, and applies to responses received from the native API. That is, a SwA or MTOM response received by Mediator from a native API will be forwarded to the client using the same format it received.
- When sending SOAP requests that do not contain a MTOM or SWA attachment to a native API that returns an MTOM or SWA response, the request 'Accept' header must be set to 'multipart/related'. This is necessary so Mediator knows how to parse the response properly.

HTTP
Connection
Timeout

Number.Optional. Specifies the time interval (in seconds) after which a connection attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the `Connection Timeout` field (in the Integration Server Administrator, go to **Settings > Extended**). *Default:* 30 seconds.

Read Timeout

Number.Optional. Specifies the time interval (in seconds) after which a socket read attempt will timeout. If a value 0 is specified (or if the value is not specified), Mediator will use the value specified in the `Read Timeout` field (in the Integration Server Administrator, go to **Settings > Extended**). *Default:* 30 seconds.

SSL
Configuration

Optional. To enable SSL client authentication that Mediator will use to authenticate incoming requests for the native API, you must specify values for both the `Client Certificate Alias` field and the `IS Keystore`

Alias field. If you specify a value for only one of these fields, a deployment error will occur.

Note: SSL client authentication is optional; you may leave both fields blank.

Prerequisite: You must set up the key alias and keystore properties in the Integration Server. For the procedure, see *webMethods Integration Server Administrator's Guide*.

You will use these properties to specify the following fields:

Value	Description
Client Certificate Alias	<i>Mandatory.</i> The client's private key to be used for performing SSL client authentication.
IS Keystore Alias	<i>Mandatory.</i> The keystore alias of the instance of Integration Server on which Mediator is running. This value (along with the value of Client Certificate Alias) will be used for performing SSL client authentication.

WS Security Header

For SOAP-based APIs.

Indicates whether Mediator should pass the WS-Security headers of the incoming requests to the native API.

Value	Description
Remove processed security headers	<i>Default.</i> Removes the security header if it is processed by Mediator (i.e., if Mediator processes the header according to the API's security run-time action). Note that Mediator will <i>not</i> remove the security header if <i>both</i> of the following conditions are true: 1) Mediator did not process the security header, and 2) the

`mustUnderstand` attribute of the security header is 0/false).

Pass all security headers

Passes the security header, even if it is processed by Mediator (i.e., even if Mediator processes the header according to the API's security action).

Throttling Traffic Optimization

This action limits the number of API invocations during a specified time interval, and sends alerts to a specified destination when the performance conditions are violated.

Reasons for limiting the API invocation traffic include:

- To avoid overloading the back-end services and their infrastructure.
- To limit specific clients in terms of resource usage (that is, you can use the “Monitor Service Level Agreement” action to monitor performance conditions for a particular client, together with “Throttle API Usage” to limit the resource usage).
- To shield vulnerable servers, services, and even specific operations.
- For API consumption metering (billable pay-per-use APIs).

Note: To enable Mediator to publish performance metrics, you must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > CentraSite Communication**). For the procedure, see *Administering webMethods Mediator*.

Input Parameters

Soft Limit

NumberOptional. The maximum number of invocations allowed per `Interval Value` before issuing an alert. Reaching the soft limit will not affect further processing of requests (until the `Hard Limit` is reached).

Note: The limit is reached when the total number of invocations coming from *all* the clients (specified in the `Limit Traffic for Applications` field) reaches the limit. Soft Limit is computed in an asynchronous manner; thus when multiple requests are made at the same time, it may be possible that the Soft Limit alert will not be strictly accurate.

Alert Message for Soft Limit *String.Optional.* A text message to include in the soft limit alert.

Hard Limit *Required.* The maximum number of invocations allowed per `Interval Value` before stopping the processing of further requests and issuing an alert. Typically, this number should be higher than the soft limit.

Note: The limit is reached when the total number of invocations coming from *all* the clients (specified in the `Limit Traffic for Consumers` field) reaches the limit. Hard Limit is computed in an asynchronous manner; thus when multiple requests are made at the same time, it may be possible that the Hard Limit alert will not be strictly accurate.

Alert Message for Hard Limit *String.Optional.* A text message to include in the hard limit alert.

Alert for Consumer Applications *String.* The consumer application(s) that this action applies to. To specify multiple consumers, use the  button to add rows, or select **Any Consumer** to apply this action to any consumer application.

Alert Interval *String.* The amount and unit (Minutes, Hours, Days or Weeks) of time for the soft limit and hard limit to be reached.

Alert Frequency *String.* Frequency to issue alerts.

Value	Description
Every Time	Default. Issues an alert every time the specified condition is violated.
Only Once	Issues an alert only the first time the specified condition is violated.

Alert Destination *String.Optional.* A place to log the alerts.

Important: Ensure that Mediator is configured to send event notifications to the destination(s) you specify here.

For details about alerts and transaction logging, see *Administering webMethods Mediator*.

Value	Description
CentraSite	<p>Sends the alerts to the API's Events profile in CentraSite.</p> <p>Prerequisite: You must configure Mediator to communicate with CentraSite (in the Integration Server Administrator, go to Solutions > Mediator > Administration > CentraSite Communication). For information about how to configure communication with CentraSite, see <i>Administering webMethods Mediator</i>.</p>
Local Log	<p>Sends the alerts to the server log of the Integration Server on which Mediator is running.</p> <p>Also choose a value in the Log Level field:</p> <ul style="list-style-type: none"> ■ Info: Logs error-level, warning-level, and informational-level alerts. ■ Warn: Logs error-level and warning-level alerts. ■ Error: Logs only error-level alerts. <p>Important: The Integration Server Administrator's logging level for Mediator should match the logging level specified for this action (go to Settings > Logging > Server Logger).</p>
SNMP	<p>Sends the alerts to CentraSite's SNMP server or a third-party SNMP server.</p> <p>Prerequisite: You must configure the SNMP server destination (in the Integration Server Administrator, go to Solutions > Mediator > Administration > Email). For the procedure, see <i>Administering webMethods Mediator</i>.</p>
Email	<p>Sends the alerts to an SMTP email server, which sends them to the email address(es) you specify here. To specify multiple addresses, use the  button to add rows.</p>

Prerequisite: You must configure the SMTP server destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > Email**). For the procedure, see *Administering webMethods Mediator*.

EDA

Mediator can use EDA to log the payloads to a database.

Prerequisite: You must configure the EDA destination (in the Integration Server Administrator, go to **Solutions > Mediator > Administration > EDA**). For the procedure, see *Administering webMethods Mediator*.

Service Result Cache

This action enables caching of the results of SOAP and REST API invocations based on the caching criteria that you define. If the Service Result Cache action is set for an API, Mediator enables caching for the API when the API is deployed using the information for the action received from CentraSite. You can define the elements for which the API responses are to be cached based on the criteria: HTTP Header, Path, or XPath Expression. You can also limit the values to store in the cache using a whitelist. And, for the elements that are stored in the cache, you can specify other parameters such as Time to Live (TTL) and maximum response payload size.

Note: In the case of REST based APIs, caching is supported only for the results of the HTTP method GET and not for other methods. Service result cache is not supported for a JSON request in a REST based API but is supported for a JSON response.

Caching the results of an API request:

- Increases the throughput of the API call
- Improves the scalability of the API

Note: We recommend the use of caching only for elements that do not require live data and state values.

Input Parameters

Configure Caching Based On	Select a caching criteria. Mediator uses this information to determine the request component that is the actual payload based on which the results of the API invocation are cached. The options are:
----------------------------------	---

	<ul style="list-style-type: none"> ■ HTTP Header Uses the HTTP header in the API request. You can use this criteria for REST based APIs that accept payloads only in HTTP format. ■ Path Uses the entire invocation URL including the query parameter. This option is applicable mainly for REST based API requests that use the URL or path parameter as the payload. ■ XPath Expression Uses the XPath expression in the API request. You can use this criteria for: SOAP based API requests whose payload is a SOAP envelope, and REST based API requests that accept payloads in XML format.
Header Name	(Only if you select HTTP Header) Specifies the HTTP header name.
Namespace	<p><i>Optional.</i> (Only if you select XPath Expression) Specifies the namespace of the XPath expression:</p> <ul style="list-style-type: none"> ■ Prefix - The prefix for the namespace. For example, soapenv or axis ■ URI - The namespace URI - For example, http://schemas.xmlsoap.org/soap/envelope/ or http://ws.apache.org/axis
XPath Expression	(Only if you select XPath Expression) Specifies the XPath expression in the API request.
Add to Whitelist	<i>Optional.</i> (Only if you select HTTP Header or XPath Expression)Mediator caches the API responses only for requests whose cache criteria matches with the one set for the action, and whose criteria evaluation results in any one of the values in this list.
Time to Live	<i>Optional.</i> Specifies the lifespan (Days Hours Minutes, for example: 5d 4h 1m) of the elements in the cache after which the elements are consider out-of-date.

Note: The maximum value that you can set for the Time to Live (TTL) parameter is 24855 days (unlimited). If no value is specified, the TTL is unlimited (does not expire). If you set the TTL value to 0d 0h 0m, the API results are not cached.

Maximum Response Payload Size	Specifies the maximum payload size for the API in kilo bytes. The value -1 stands for unlimited payload size.
-------------------------------	--

Mediator uses the Ehcache capability provided by Integration Server to cache the results of the API calls. You can configure caching for a single Mediator node or for a cluster. For details on configuring Ehcache, see *webMethods Integration Server Administrator's Guide*.

Recommendations and Best Practices for Service Result Caching

This section provides guidance on the use of caching for the results of an API request.

- Caching is not recommended in cases where consumers absolutely rely on current information retrieved from a back-end service.
- As caching will occur in memory, ensure that you are not operating in a memory constrained environment.
- Balance the memory consumption with the API response sizes. If your API returns huge responses or large binary attachments, limit caching by specifying the maximum size of the cache or by defining data eviction policies to avoid excessive memory consumption.
- Design the APIs for which you want to implement caching to be idempotent to support reliable caching.
- Configure a suitable value for the Time to Live (TTL) parameter for the cache entries based on your business needs and the use cases for your API.

For example, if your API serves static product catalog data which is only updated once a quarter choose a large TTL value. If your API serves for example environmental data where a certain age of the data is tolerated, choose a TTL value like 15 minutes.

Note: A TTL value that you set in a standalone Mediator is reset if the Mediator restarts. For example, if you set 15 minutes as the TTL value of an element which is inserted after 10 minutes, and Mediator restarts. The element has a TTL value of 15 minutes after the Mediator is restarted.

- Caching of the results of an API call is recommended:
 - If the response time of a direct query to the database is high or subject to high latencies, and if the data requested does not change frequently or is static.
 - If the client applications can use slightly outdated, cached data. For example, a weather API can be supplied data from a cache which is an hour old.
 - If there are temporary service interruptions on the server side, to mitigate these interruptions with data from the cache.

- If the API that requests data is subject to traffic management rules, usage quotas, or if billing is based on the number of calls to the API, you can overcome these by using cached data.
- Caching may not be effective or is not recommended:
 - If the response of a direct request for data to the database is very fast and scaling is not an issue, using cached data may not provide additional benefits.
 - If your API uses non-idempotent requests.

Validate Schema

This action validates all XML request and/or response messages against an XML schema referenced in the WSDL.

Mediator can enforce this action for messages sent between APIs. When this action is configured for a proxy API, Mediator validates XML request messages, response messages, or both, against the XML schema referenced in the WSDL.

Input Parameters

Validate SOAP
Message (s)

Object. Validates request and/or response messages. You may select both Request and Response.

<u>Value</u>	<u>Description</u>
Request	Validate all requests.
Response	Validate all responses.

Important: Be aware that Mediator does not remove `wsu:Id` attributes that may have been added to a request by a client as a result of security operations against request elements (i.e., signatures and encryptions). In this case, to avoid schema validation failures you would have to add a "[Request Transformation](#)" on page 435 action or a "[Response Transformation](#)" on page 434 action to the API so that the requests and responses are passed to an XSL transformation file that removes the `wsu:Id` attribute.

Computed Runtime Actions

CentraSite Business UI offers you the possibility to add computed runtime actions into the policy workflow; this gives you the option to define your own runtime action; which means that you can implement your own algorithms for representing the action's user interface.

Computed runtime actions let you create your own layout by using a UI Rendering Concept. You can also specify your own rendering logic to display the computed values. You could, for example, create a custom display of the attribute as a drop down or a radio button.

A computed runtime action can be implemented using the GWT framework. For a computed runtime action, you create an archive file that contains the plug-in definition, and you load the archive file in the CentraSite BUIExtension folder.

Writing Your Own Computed Runtime Action

A computed runtime action can be implemented as a plug-in. The prepared plug-in is a collection of files in a specific directory structure. After implementing the plug-in, the files are copied into the CentraSiteBUIExtension folder in `<CentraSiteInstallDir> \demos` directory.

In the following sections, we demonstrate a sample framework named “MyComputedRuntimeAction” that illustrates how a custom computed runtime action may be set up.

You may use this sample as a guideline, adapting it and renaming it to suit your individual requirements. The sample indicates where customization is required.

The Build Environment

This section explains the build environment for generating the files that are used for the GUI and for compiling the necessary Java source files. It assumes the use of Ant, the Java-based build tool.

The following file system structure under the computed runtime action directory is assumed:

Name of File or Folder	Description
src	This folder that holds the Java source files.
lib	This folder contains the archive file, plug-in's executor class and the external libraries.
build.xml	The Ant input file for building the destination files

The Ant file, build.xml can be used to establish a custom computed profile.

The classpath for the build step must refer to all JAR files contained in the redist folder of the CentraSite installation. Add these JAR files to the build path of your java project also.

Implementation Guidelines for Computed Runtime Action

In order to create, install and use plug-ins, you must perform the following tasks:

- ["Implementation for Computed Action UI" on page 459](#)
- ["Implementation for Computed Action Parser" on page 461](#)

This section does not explain all the details of the Java source file; its purpose is to indicate the code that must be modified to suit your environment.

Implementation for Computed Action UI

**src\com\softwareag\centrasite\buil\extension\client\runtime\action
MyComputedRuntimeActionWidget.java**

```
public class MyComputedRuntimeActionWidget extends Composite {
    private PolicyActionJSO policyActionJso = null;
    private TextBox valueBox = null;
    private static final String WARNING_CSS = "loginTextBoxErrorBorder";

    public MyComputedRuntimeActionWidget(String policyActionJson) {
        FlowPanel container = new FlowPanel();
        initWidget(container);

        policyActionJso = getPolicyActionJso(policyActionJson);
        if (policyActionJso == null) {
            Label helloLabel = new Label("The JSON content is empty");
            container.add(helloLabel);
            return;
        }

        //Render widgets
        container.add(getParametersView(policyActionJso));
    }

    private Widget getParametersView(PolicyActionJSO policyActionJso) {
        FlowPanel parametersContainer = new FlowPanel();

        JsArray<ParameterJSO> parameters = policyActionJso.getParameters();
        if (parameters == null) {
            return parametersContainer;
        }

        for (int i = 0; i < parameters.length(); i++) {
            parametersContainer.add(getParameterView(parameters.get(i)));
        }

        return parametersContainer;
    }

    private Widget getParameterView(ParameterJSO parameterJso) {
        FlowPanel parameterContainer = new FlowPanel();
        Label nameLabel = new Label(parameterJso.getName());
        parameterContainer.add(nameLabel);

        valueBox = new TextBox();
        valueBox.setLayoutData(parameterJso.getId());

        String[] values = parameterJso.getValues();
        if (values != null && values.length > 0) {
```

```

        valueBox.setValue(values[0]);
    }

    parameterContainer.add(valueBox);
    return parameterContainer;
}
public static native PolicyActionJso getPolicyActionJso(String json) /*-{
    return eval('(' + json + ')');
}-*/;
public String getJson() {
    JsArray<ParameterJso> parameters = policyActionJso.getParameters();
    ParameterJso parameterJso = null;
    if (parameters != null && parameters.length() > 0) {
        parameterJso = parameters.get(0);

        String[] values = {valueBox.getValue()};
        parameterJso.setValues(values);
    }

    return policyActionJso.toJSON();
}
public boolean isValid() {
    String value = valueBox.getValue();
    boolean isValid = (value != null && !"".equals(value));
    if (!isValid) {
        valueBox.addStyleName(WARNING_CSS);
    } else {
        valueBox.removeStyleName(WARNING_CSS);
    }

    return isValid;
}
}

```

The `MyComputedRuntimeActionWidget` class extends the class `Composite`, which declares the basic rendering methods for the CentraSite Business user interface.

Implementations and Description

`MyComputedRuntimeActionWidget(String policyActionJso)`

Constructor dictates the user-defined rendering of the action's UI.

`getPolicyActionJso`

Returns the JSON object from the specified object.

`String getJson()`

Returns a JSON encoded string representing the action's parameters.

`boolean isValid()`

Enforces validation logic for the action's parameter values.

Implementation for Computed Action Parser

To implement your own computed runtime action with custom UI rendering, the parser (`MyComputedRuntimeActionParser.java`) must be located in the service directory. A parser is responsible for generating compressed JSON data from the given policy action instance, and creating a custom rendering of the action instance using the JSON data.

Here is the frame of the computed runtime action parser implementation:

`src\com\softwareag\centrasite\buil\extension\service\MyComputedRuntimeActionParser.java`

```
public class MyComputedRuntimeActionParser extends BasePolicyActionExtensionParser {
    public MyComputedRuntimeActionParser(CentraSiteSession centraSiteSession,
        CentraSitePolicyActionTemplate actionTemplate,
        CentraSitePolicyActionInstance actionInstance) {
        super(centraSiteSession, actionTemplate, actionInstance);
    }
    @Override
    public CentraSitePolicyActionInstance getActionInstance(String json)
        throws CLLEException {
        Gson gson = new Gson();
        MyComputedRuntimeActionInfo actionInfo = gson.fromJson(json,
            MyComputedRuntimeActionInfo.class);

        if (actionInfo == null) {
            return null;
        }

        CentraSitePolicyActionInstance policyActionInstance = null;
        CentraSiteObjectManager objectManager =
            getCentraSiteSession().getCentraSiteObjectManager();

        if (actionInfo.isActionInstance()) {
            policyActionInstance = objectManager.getPolicyActionInstance(action
Info.getId());
        } else {
            policyActionInstance = objectManager.createPolicyActionInstance(act
ionInfo.getId());
        }

        if (policyActionInstance == null) {
            return null;
        }

        setParameterValues(policyActionInstance, actionInfo);
        return policyActionInstance;
    }
    private void setParameterValues(CentraSitePolicyActionInstance
        policyActionInstance, MyComputedRuntimeActionInfo actionInfo)
        throws CLLEException {
        List<MyComputedRuntimeParameterInfo> parameters = actionInfo.getParame
ters();
        if (parameters == null || parameters.isEmpty()) {
            return;
        }

        MyComputedRuntimeParameterInfo parameterInfo = parameters.get(0);
        Collection<Object> convertedParameterValues = new ArrayList<Object>();
        convertedParameterValues.addAll(parameterInfo.getValues());
        policyActionInstance.setAttributeValue(parameterInfo.getId(),
            convertedParameterValues);
    }
}
```

```

@Override
public String getJson() throws CLLEException {
    Gson gson = new Gson();

    MyComputedRuntimeActionInfo actionInfo = null;
    if (getActionInstance() != null) {
        CentraSitePolicyActionTemplate policyActionTemplate =
            getActionInstance().getCentraSitePolicyActionTemplate();
        actionInfo = new MyComputedRuntimeActionInfo(getActionInstance().g
etId(),
            policyActionTemplate.getName());
        actionInfo.setActionId(policyActionTemplate.getId());
        actionInfo.setIsActionInstance(true);
    } else if (getActionTemplate() != null) {
        actionInfo = new MyComputedRuntimeActionInfo(getActionTemplate().g
etId(),
            getActionTemplate().getName());
        actionInfo.setActionId(getActionTemplate().getId());
    }

    fillParameterInfos(getActionTemplate(), actionInfo);
    return (actionInfo != null ? gson.toJson(actionInfo) : null);
}
private void fillParameterInfos(CentraSitePolicyActionTemplate actionTemplate,
    MyComputedRuntimeActionInfo actionInfo) throws CLLEException {
    if (actionTemplate == null) {
        return;
    }

    Collection<CentraSiteObjectAttribute> attributes = actionTemplate.getA
ttributes();
    if (attributes == null || attributes.isEmpty()) {
        return;
    }

    List<MyComputedRuntimeParameterInfo> parameters = new
    ArrayList<MyComputedRuntimeParameterInfo>(attributes.size());
    MyComputedRuntimeParameterInfo parameter = null;
    for (CentraSiteObjectAttribute attribute : attributes) {
        parameter = new MyComputedRuntimeParameterInfo(attribute.getName(),
            attribute.getDisplayName());
        parameters.add(parameter);
    }

    actionInfo.setParameters(parameters);
}
}

```

Setting up the Computed Action Plug-in

The following list shows the main methods on each of the two Java source files `MyComputedRuntimeActionWidget.java` and `MyComputedRuntimeActionParser.java` and describes the type of functions that they serve.

- The `getPolicyActionJson` method returns the JavaScript Object (JSO) from the given JSON-formatted string.
- The `getActionInstance` method returns a `CentraSitePolicyActionInstance` object from the given JSON-formatted string.

- The `String getJson` method returns a JSON-formatted string from the existing policy action instance.
- The `boolean isValid()` method enforces a validation logic for the user-defined rendering of the runtime action.

Assuming that you have set up all the Java files correctly in the directories, you should be able to build with the command:

```
ant -f build.xml jar all
```

Activating the Computed Action

After you define the computed action as a plug-in (extension point) with the above steps, enable the computed action in the Business UI configuration file `centrasite.xml` in order to display the action in the policy accordion.

Important: Remember that the action parameters defined in the configuration file are editable and cannot be protected.

To activate the plug-in

1. Open the `centrasite.xml` file.
The configuration file is located in the `cast\cswebapps\BusinessUI\system\conf` directory.
2. Navigate to the property lines `<UIProperties>` -> `<Extensions>` -> `<PolicyActions>`
3. Append the property statement for your custom computed runtime action (`MyComputedRuntimeAction`) as below:

```
<PolicyActions>
  <PolicyAction id="uddi:44e3e2de-064c-432f-b67a-8fbca0fb04d6"
    class="com.softwareag.centrasite.bui.extension.service.
MyComputedRuntimeActionParser" />
</PolicyActions>
```

wherein,

Parameter	Description
<code>id</code>	A unique identifier for the computed action. It uniquely distinguishes an action in the CentraSite registry. If you wish to reconfigure the action at a later stage, you identify the action using this id.
<code>class</code>	A parser implementation for the computed action.

4. Save and close the configuration file.
5. Restart Software AG Runtime.

Sample Computed Runtime Action

Your CentraSite installation contains a sample computed runtime action (which is contained in demos folder) that you can use to create an archive file for the custom runtime action specific to the CentraSite Business UI.

- SampleComputedRuntimeAction
