1.0 Critical Information

This section lists any critical issues for the current release that were known when this readme was published. For critical information found later, go to the Knowledge Center on the [Empower website](#).

2.0 Known Issues

This section lists any issues for the current release that were known when this readme was published. For known issues found later, go to the Knowledge Center on the [Empower website](#).

Deployer

- WMDPD-1067
Deployer does not show process models as dependencies for associated event maps. When you include an event map that is associated with a process model in an Optimize deployment set, Deployer does not list the process model as a dependency. You therefore cannot resolve this dependency and include the process model in the deployment set.
Workaround: Create and deploy a deployment set that includes the process model and then deploy the event map.
- WDY-4373
Deployment of Universal Messaging assets fails when part of a project also includes assets from *Optimize*.
Universal Messaging supports different implementations of repository-based deployment than Optimize, and they are not compatible when deploying as part of a single project.
Workaround: Create a project for the Universal Messaging assets and deploy it separately from the project that contains the Optimize.

3.0 Usage Notes

This section provides any additional information you need to work with the current release of this product.

Deployer

- Runtime-based deployment projects can deploy assets from 7.1 SP3 and later releases of webMethods runtimes. To accommodate deployment of assets from earlier releases, create source and target servers for specific versions of the Deployer. Projects can include only sources and targets of the same version except for version 8.0 assets, which you can deploy to either 8.0 or 8.2 servers.
- Repository-based deployment projects support checkpoint and rollback for all runtimes except for webMethods Optimize.
- Repository-based deployment projects support deletion sets for all runtimes except for Optimize.
- Repository-based projects support configuration of project settings through the Project Automator.

- Deployer now supports the ability to use zip file as a source in SideBySide upgrade.
